H. KUSCHEL (Forschungsgesellschaft fuer angewandte Naturwissenschaften, Forschungsinstitut fuer Hochfrequenzphysik, Wachtberg-Werthhoven, West Germany) IN: International Radar Conference, Arlington, VA, May 6-9, 1985, Record . New York, Institute of Electrical and Electronics Engineers, Inc., 1985, p. 169-174. refs

A method for the evaluation of transhorizon radar ranges in a short distance environment is described. The method is based on detailed terrain structure information using a digital terrain data base and on a multiple knife edge diffraction propagation model. From the results of a number of simulations in the different types of terrain being typical for Central Europe, mean transhorizon radar range curves are obtained, indicating the capability of radar systems to detect targets beyond the horizon. Varying parameters are the radar wavelength, the radar antenna height and the maximum free space radar range, where the latter depends on radiated power, antenna gain, radar cross section, and other parameters. ### DETECTION AND RECOGNITION OF HAZARDOUS WEATHER CONDITIONS BY PRIMARY SURVEILLANCE RADAR

W. KLEMBOWSKI (Przemyslowy Instytut Telekomunikacji, Warsaw, Poland) IN: International Radar Conference, Arlington, VA, May 6-9, 1985, Record . New York, Institute of Electrical and Electronics Engineers, Inc., 1985, p. 226-231. refs

The method of radar range prediction for the weather channel incorporated is PSR is presented. The recognition is based on the following assumptions: hazardous objects have height above the zero izotherm level and reflectivity greater than 40 dBZ. Results of weather clutter detection in the weather channel of the L-band Polish PSR AVIA C are given. Author

### NEW CFAR-PROCESSOR BASED ON AN ORDERED STATISTIC

H. ROHLING (Telefunken AG, Ulm, West Germany) IN: International Radar Conference, Arlington, VA, May 6-9, 1985, Record . New York, Institute of Electrical and Electronics Engineers, Inc., 1985, p. 271-275. refs

In the present paper, a CFAR (constant false alarm rate) method is discussed using as the CFAR threshold one single value selected from the so-called ordered statistic. This procedure has some advantages over cell averaging CFAR, especially in cases where more than one target is present within the reference window on which estimation of the local clutter situation is based, or where this reference window is crossing clutter edges. ### COMPUTATIONALLY SIMPLE ADAPTIVE TRACKING FILTERS BASED ON WEIGHTED AVERAGES

E. THOMAS (Electronics and Radar Development Establishment, Bangalore, India) IN: International Radar Conference, Arlington, VA, May 6-9, 1985, Record . New York, Institute of Electrical and Electronics Engineers, Inc., 1985, p. 416-423. refs

A new algorithm for state estimation, based on certain fading-memory weighted averages, is introduced. The state estimates are obtained through linear combinations of the weighted averages. In their basic general forms, the second-order and third-order Weighted Average Filters are equivalent to over-damped alpha-beta and alha-beta-gamma filters, respectively. Different linear combinations of the weighted averages give state estimates with different band-width characteristics simultaneously. This property leads to the decision-directed, multi-level, switching type adaptive filter described. In the swinging type adaptive filter described later, simple maneuver dependent modifications to the weighted averages make the filter continually self-adaptive to changing situations, with optimized parameters. The computational simplicity of this type is very attractive for tracking maneuvering targets in a real-time, multi-target environment. Author

### STEP RELAXATION METHOD FOR MODAL TEST IMPLEMENTED WITH FREQUENCY-DOMAIN PREPROCESSING

F. R. VIGNERON and Y. SOUCY (Department of Communications, Communications Research Centre, Ottawa, Canada) AIAA Journal (ISSN 0001-1452), vol. 24, April 1986, p. 657-663. refs

A continuous longeron space mast having several low frequency, closely spaced modes is taken as an illustrative case demonstrating the 'step relaxation' method for modal testing, which encompasses the preprocessing of data in the frequency domain. Although excellent performance was obtainable in the 0-20 Hz range, the method was not successful for modes above 20 Hz. Attention is given to the construction of the measurement-based frequency-response function, and to parameter identification using a complex exponentials method. O.C.

### TURBULENT BOUNDARY-LAYER WALL PRESSURE FLUCTUATIONS DOWNSTREAM OF A TANDEM LEBU

G. B. BEELER (NASA, Langley Research Center, Hampton, VA) AIAA Journal (ISSN 0001-1452), vol. 24, April 1986, p. 689-691. refs

An initial measurement of turbulent wall pressure fluctuations downstream of tandem large eddy breakup devices (LEBUs) indicates a significant reduction by comparison with the reference case of a flat plate; the average magnitude of the reduction is 12.5 percent. Peak reduction is at 7-8 kHz, and is of the order of the C(f) reduction due to the tandem LEBUs. These data indicate a secondary benefit derivable from LEBUs, in addition to their skin friction reduction effect. O.C.

### COMPARISON OF SOME TIME DOMAIN METHODS FOR STRUCTURAL SYSTEM IDENTIFICATION

J. E. COOPER and J. R. WRIGHT (Queen Mary College, London, England) IN: International Symposium on Aeroelasticity and Structural Dynamics, 2nd, Aachen, West Germany, April 1-3, 1985, Collected Papers . Bonn, Deutsche Gesellschaft fuer Luft- und Raumfahrt, 1985, p. 595-604. refs

The modal parameters of a structural system may be identified from test data by a variety of frequency and time domain methods. In this paper three time domain methods, based on the difference equation model relating sampled response and excitation, are considered. The Least Squares, Instrumental Variables and Correlation Fit methods are described and applied to one and two mode simulated data in the presence of input or measurement noise with various noise-to-signal ratios. The results from a number of tests are compared statistically in order to examine the scatter on damping results and whether they are biased. The Correlation Fit method is seen to be the most suitable method for further development. Author

**CALCULATION OF STRUCTURAL ELEMENTS OF AIRCRAFT: SANDWICH PLATES AND SHELLS [RASCHETY ELEMENTOV AVIATSIONNYKH KONSTRUKTSII: TREKHSLOINYE PLASTINY I OBOLOCHKI]**
A. IA. ALEKSANDROV, ED., R. E. LAMPER, ED., and V. G. SUVERNEV Moscow, Izdatel'stvo Mashinostroenie, 1985, 208 p. In Russian. No individual items are abstracted in this volume.

The papers presented in this volume provide an overview of theoretical and experimental research in the field of sandwich plates and shells, with particular attention given to the stress-strain and stability analyses of sandwich structures under conditions of complex mechanical and thermal loading. Topics discussed include the transverse bending of sandwich beams, the stability of a cylindrical sandwich shell under compression, the effect of nonuniform heating on the stability of cylindrical sandwich shells under compression, and determination of the optimal parameters of sandwich plates and shallow shells with a honeycomb core under longitudinal compression and heating. Papers are also presented on the stability of a sandwich shell in shear and an iteration theory for the bending of essentially nonuniform plates. V.L.

**IMPINGING JETS**
N. S. NOSSEIR (San Diego State University, CA) IN: Encyclopedia of fluid mechanics. Volume 2 . Houston, TX, Gulf Publishing Co., 1986, p. 349-366. refs
(Contract F49620-78-C-0060; N00014-84-K-0373)

The properties of an axisymmetric, subsonic jet impinging on an infinitely large flat plate are discussed. The mechanisms governing the behavior of the jet are explained based on experimental work. The turbulence characteristics of three modules of the jet are considered, namely the free jet, the stagnation flow, and the wall jet modules. Resonance phenomena at high speeds are examined, including feedback, phase lock, and collective interaction. It is shown that far-field noise is generated by two different mechanisms and propagates along two different paths. C.D.

**SHAPE OPTIMIZATION OF AXISYMMETRIC STRUCTURES [OPTIMISATION DE FORME DES STRUCTURES AXISYMETRIQUES]**
C. LALLEMAND Lyon, Institut National des Sciences Appliquees, Docteur (3e cycle) Thesis, 1985, 154 p. In French. refs

Using the finite element method, a general algorithm for the shape optimization of axisymmetric structures subjected to nonsymmetric loading (Fourier series expansions) is presented. In this system, the tangential constraint is minimized, and the Lagrangian method is extended to the mathematical optimization of a function, subject to certain limitations. Several improvements are made on the gradient calculation. The system has application to the aerospace field, where mechanical reliability is crucial, and the method is demonstrated for the specific example of a helicopter gearbox. R.R.

A system was developed for the calibration and development of thermal ion instrumentation. The system provides an extended beam with usable current rates, approx. 1 pA/sq cm, at beam energies as low as 1 eV, with much higher values available with increasing energy. A tandem electrostatic and variable geometry magnetic mirror configuration within the ion source optimizes the use of the ionizing electrons. The system is integrated under microcomputer control to allow automatic control and monitoring of the beam energy and composition and the mass and angle-dependent response of the instrument under test. The system is pumped by a combination of carbon vane and cryogenic sorption roughing pumps and ion and liquid helium operating pumps. E.A.K.

Results and developments of aeroelastic investigations of tip vane wind turbines are presented. Aerodynamic (transfer) flow pieces were applied in the sharp angles between tip vanes and blades to reduce resistance caused by flow release. Analysis of the power curve shows a flow resistance reduction. Helicopter blades appear not to be optimal aerodynamically. Torsional stress measurements on the blade root show a higher flutter rpm, induced by a reduced aerodynamic load of the tip vane. Programs to predict ground resonances and whirl-flutter of a two bladed rotor on a pylon with symmetric stiffness were developed. The programs are part of a stability program which describes a flexible rotor on a flexible pylon. Author (ESA)

P. A. JOOSSE Oct. 1983 49 p refs In DUTCH
(VTH-M-487) Avail: NTIS HC A03/MF A01

Based on undisturbed thin walled multicell closed cross sections, an interactive program for the determination of the center of gravity, stress center, shear center, and torsional stiffness of wind turbine blades was developed. In the case of bending it is assumed that the cross sections stay plane, and stress is proportionate to elasticity (Hookes law). Based on the Saint Venant principle, the shear center was calculated using shear flow caused by cross forces. Wing profiles with a thickness/chord ratio 0.20 were assumed. Magnitudes of a three cell hexagon and a Kevlar NACA 23000 profile for tip vanes were calculated. Author (ESA)

(VTH-M-501; PR-10) Avail: NTIS HC A02/MF A01

Tip vane flow resistance was investigated, replacing blades by pipes. Experiments show resistances on the windward side, leading to malfunctioning of the turbine. A cross flow to which the helicopter wing profile used is sensitive was established. Aeroelastic wind tunnel model experiments were started. The importance of stall flutter at tip vane rotors is shown. From calculations it appears that the stability of the rotor can be increased by the application of flapping hinges in the blade root, giving the generator a rotation direction opposite to the rotor, and placing the rotor behind the pylon. W. P. KOPPENS and W. KUIK Jun. 1984 9 p refs In DUTCH
(VTH-M-517; PR-11) Avail: NTIS HC A02/MF A01

Results and developments of aeroelastic investigations of tip vane wind turbines are presented. The Liebeck (Kolibrie helicopter) wing profile was replaced by a NACA-23012 and a profile specially developed for tip vanes. The Liebeck profile is sensitive to disturbances (torsion) reducing the power coefficient. Flow resistance experiments show that the resistance is caused by viscous and induced resistances. Power curves of a one-blade rotor with and without tip vane were determined in a wind tunnel. The neglect in aeroelastic literature of the contribution of the dynamic profile curvature in case the angle of attack is used instead of the 3/4 chord point appears not permissible. Author (ESA)

SAR imagery is generated by matched filtering the raw azimuth signal history, assuming uniform straight line motion of the aircraft. Unknown aircraft motions alter the matched filter required for processing. Autofocussing involves determinating from the raw data the appropriate matched filter. In this document the principles of SAR and the requirement for an autofocus system are discussed. Three autofocus methods are investigated: measurement of the power spectrum, contrast maximization, and registration of multilook images. The power spectrum is shown to be unreliable as an autofocus aid. Results of the contract maximisation and registration methods are compared. GRA

Recent technological advances in airplane construction techniques and materials allow for the production of aerodynamic surfaces without significant waviness and roughness, permitting long runs of natural laminar flow (NLF). The present research effort seeks to refine and validate computational design tools for use in the design of axisymmetric and nonaxisymmetric natural-laminar-flow bodies. The principal task of the investigation involves fuselage body shaping using a computational design procedure. Analytical methods were refined and exploratory calculations conducted to predict laminar boundary-layer on selected body shapes. Using a low-order surface-singularity aerodynamic analysis program, pressure distribution, boundary-layer development, transition location and drag coefficient have been obtained for a number of body shapes including a representative business-aircraft fuselage. Extensive runs of laminar flow were predicted in regions of favorable pressure gradient on smooth body surfaces. A computational design procedure was developed to obtain a body shape with minimum drag having large extent of NLF. Author

This project was begun in 1979 as a study of three dimensional transonic flows through channels and between compressor blades. In the latter problem, the blades were to be lightly loaded. In 1981, a 3 year study with the broadened goal of studying flow problems in turbomachines was initiated. Specifically, the work was to include a continuation of that in progress on three-dimensional transonic flows through a lightly loaded compressor blade row, supersonic flow over a compression ramp with a turbulent boundary layer, and consideration of transonic flows over heavily loaded blades in a compressor, starting with a two-dimensional cascade and then going to a three-dimensional rotor if the calculations for the cascade was successful. The work in heavily loaded cascades was to build on the experience gained in the lightly loaded case. The work on the compression ramp has application at blade-shroud interfaces in transonic and supersonic flows. Asymptotic methods of analysis have been employed in all the problems to be described, with numerical methods of solution used as needed in some of the inner regions of the flow fields and to illustrate results for example problems. Avail: NTIS HC A04/MF A01 CSCL 13I

A turbine modeling technique has been developed which will enable the user to obtain consistent and rapid off-design performance from design point input. This technique is applicable to both axial and radial flow turbine with flow sizes ranging from about one pound per second to several hundred pounds per second. The axial flow turbines may or may not include variable geometry in the first stage nozzle. A user-specified option will also permit the calculation of design point cooling flow levels and corresponding changes in efficiency for the axial flow turbines. The modeling technique has been incorporated into a time-sharing program in order to facilitate its use. Because this report contains a description of the input output data, values of typical inputs, and example cases, it is suitable as a user's manual. This report is the second of a three volume set. The titles of the three volumes are as follows: (1) Volume 1 CMGEN USER's Manual (Parametric Compressor Generator); (2) Volume 2 PART USER's Manual (Parametric Turbine); (3) Volume 3 MODFAN USER's Manual (Parametric Modulation Flow Fan).

A modeling technique for single stage flow modulating fans or centrifugal compressors has been developed which will enable the user to obtain consistent and rapid off-design performnce from design point input. The fan flow modulation may be obtained by either a VIGV (variable inlet guide vane) or a VPF (variable pitch rotor) option. Only the VIGV option is available for the centrifugal compressor. The modeling technique has been incorporated into a time-sharing program to facilitate its use. Because this report contains a description of the input output data, values of typical inputs, and examples cases, it is suitable as a user's manual. This report is the last of a three volume set describing the parametric representation of compressor fans, and turbines. The titles of the three volumes are as follows: (1) Volume 1 CMGEN USER's Manual (Parametric Compressor Generator); (2) Volume 2 PART USER's Manual (Parametric Turbine); (3) Volume 3 MODFAN USER's Manual (Parametric Modulating Flow Fan).

**INVESTIGATION OF MULTIPLE INPUT FREQUENCY RESPONSE FUNCTION ESTIMATION TECHNIQUES FOR EXPERIMENTAL MODAL ANALYSIS Ph.D. Thesis**

R. W. ROST 1985 237 p
Avail: Univ. Microfilms Order No. DA8526568

The accurate measurement of the frequency response function is vital to the estimation of the modal parameters of a system. The use of single input/output theory to formulate the equations for the frequency response function can be replaced by an equivalent theory involving multiple inputs. The results of this approach provide frequency response functions that are comparable to the single input/output case but with an increase in the consistency of modal frequency and damping values estimated from different frequency response functions. The concept of MAC, Modal Assurance Criterion, was expanded to include the possibility of multiple reference data. Numerous tests were conducted to evaluate and prove the techniques presented. The structures range from machine tools, airplanes, automobiles, electric generators, and encompass almost any large structure imaginable.

**AN ILL WIND**

J. W. WILSON (National Center for Atmospheric Research, Boulder, CO) Natural History (ISSN 0028-0712), vol. 95, March 1986, p. 48-51.

Downbursts which are produced when a rain shower or thunderstorm creates a current of rapidly downward moving air that spreads horizontally in a starburst pattern when it hits the ground are studied. Data from field experiments examining airflow in downbursts with Doppler radar and anemometers reveal that downbursts occur in varying sizes and strengths, and last for an average of 10-20 minutes. It is observed that microbursts are downbursts with diameter of 0.25-2.5 miles and they endanger aircraft. Variations in the intensity of the head wind and airflow over the wings affects the aircraft. The formation processes for cool air masses which cause the downdraft to reach the ground and produce microburst wind shear are examined. An experiment demonstrating the usefulness of wind shear warnings and the need to develop microburst real-time forecast and warning services are discussed.

**NOISE OF THE GENERAL AVIATION AIRPLANES INFLUENCE ON ENVIRONMENT OF THE AIRCLUB, AIRFIELDS AND ON CREWS**

S. GVOZDENOVIC, D. ZORIC (Beograd, Univerzitet, Belgrade, Yugoslavia), and M. TAUSANOVIC (Jugoslovenski Aerotransport, Belgrade, Yugoslavia) IN: Inter-noise 85; Proceedings of the Fourteenth International Conference on Noise Control Engineering, Munich, West Germany, September 18-20, 1985. Volume 1. Dortmund, West Germany, Bundesanstalt fuer Arbeitsschutz, 1985, p. 307-310.

Noise measurements from general aviation at airport in Yugoslavia, both outside and inside the cockpit, are reported. Measurements were made at 1800 m and at 1000 m from the takeoff starting point, and the results are presented as a function of aircraft type. Noise levels are given for start of engine, taxiing, takeoff, climb, cruise, approach to landing, short final, and braking.

**WHAT SHOULD BE KNOWN ON THE ENVIRONMENTAL IMPACT ASSESSMENT FOR A PLANNING AIRPORT**

Z. MAEKAWA (Kobe University, Japan) IN: Inter-noise 85; Proceedings of the Fourteenth International Conference on Noise Control Engineering, Munich, West Germany, September 18-20, 1985. Volume 2 . Dortmund, West Germany, Bundesanstalt fuer Arbeitsschutz, 1985, p. 871-874. refs

Attention is given to the development status of noise prediction methods applicable to commercial airport operations during the airport planning stage; such prognostications are notably complicated by meteorological effects. Projections are made on the basis of experimental long distance noise propagation data, theoretical calculations of the noise propagation effects of various meteorological conditions, and aircraft noise level measurements obtained to date for operations at Osaka International Airport. **A QUIET STOLPORT? CONVINCING THE PUBLIC**

J. G. CHARLES and W. STUBBS (Bickerdike Allen Partners, London, England) IN: Inter-noise 85; Proceedings of the Fourteenth International Conference on Noise Control Engineering, Munich, West Germany, September 18-20, 1985. Volume 2 . Dortmund, West Germany, Bundesanstalt fuer Arbeitsschutz, 1985, p. 891-894.

Because of the need for efficient air travel between London and other centers, a plan was developed to introduce STOL aircraft services using quiet aircraft at a peninsular site wide enough and long enough for a 762 m STOL runway to be constructed. This paper discusses noise disturbances and the problem of convincing the public that an inland airport can be constructed within 20 min travel time of the city's center. The aircraft which would form the basis of any operation at the STOLport, the De Havilland Dash 7, was brought to the area to carry out a simulated approach and landing so that the public could actually experience the noise it made; noise measurements were made so that a data base for technical evaluations could be formed. In spite of this simulation and detailed data presentation, there was criticism and distrust on the part of the public. At the inquiry, it was stated that the noise and number index was unsuitable as a noise disturbance measure, and that despite present intentions, subsequent development would cause a major environmental problem. It is concluded that even greater clarity is needed on the part of those assessing noise impact so as to avoid spreading doubt and dismay. K.K.

**TOMORROW'S WEATHER - NEW ACCURACY IN FORECASTING**

G. GRAFF High Technology (ISSN 0277-2981), vol. 6, April 1986, p. 27-35.

Projects designed to enhance the accuracy of routine and long-range forecasts and to guarantee early detection of such hazards as tornadoes and wind shear are presented. The Program for Regional Observing and Forecasting Services (PFOFS) aims to overcome conventional forecasting barriers by covering a limited geographical region and by processing the available data more rapidly. One component of PROFS, the advanced Doppler radar, is incorporated into a weather detection effort called Nexrad, whose purpose is to spot severe storms far earlier than is possible with conventional radar. Tornadoes can be spotted well in advance, as well as wind shear. The weather tracking system McIDAS is discussed together with projects designed to enhance air safety, such as the Airport Weather Observing System and the Airport Surface Observing System. Satellite-borne lasers will be used to monitor upper-air activity, and increased accuracy in long-range forecasting will be provided by the Tropical Oceans and Global Atmosphere project. By the turn of the century, it is predicted that two-week forecasts will have the kind of specificity now associated with two-day forecasts. K.K.

(NASA-CR-3960; NAS 1.26:3960) Avail: NTIS HC A09/MF A01 CSCL 04B

The first experiment to combine airborne Doppler Lidar and ground-based dual Doppler Radar measurements of wind to detail the lower tropospheric flows in quiescent and stormy weather was conducted in central Oklahoma during four days in June-July 1981. Data from these unique remote sensing instruments, coupled with data from conventional in-situ facilities, i.e., 500-m meteorological tower, rawinsonde, and surface based sensors, were analyzed to enhance understanding of wind, waves and turbulence. The purposes of the study were to: (1) compare winds mapped by ground-based dual Doppler radars, airborne Doppler lidar, and anemometers on a tower; (2) compare measured atmospheric boundary layer flow with flows predicted by theoretical models; (3) investigate the kinematic structure of air mass boundaries that precede the development of severe storms; and (4) study the kinematic structure of thunderstorm phenomena (downdrafts, gust fronts, etc.) that produce wind shear and turbulence hazardous to aircraft operations. The report consists of three parts: Part 1, Intercomparison of Wind Data from Airborne Lidar, Ground-Based Radars and Instrumented 444 m Tower; Part 2, The Structure of the Convective Atmospheric Boundary Layer as Revealed by Lidar and Doppler Radars; and Part 3, Doppler Lidar Observations in Thunderstorm Environments. This report describes the progress in research on the properties of the Lockheed 3-D elliptic grid generation procedure and improvement of its capabilities for treating complex geometric features characteristic of aircraft configurations. Two areas of weakness in the original technique relate to the fundamentally important capability for generating curved-surface grids as a necessary prerequisite for generating 3-D space grids. These weaknesses were: (1) difficulties associated with the limitations of Cartesian coordinates for describing convex surfaces; and problems in controlling the orthogonality of the grid near boundaries. The bulk of the first year's research resulted in development of a generalized system of elliptic grid generation equations that allow both the surface and the grid to be described in terms of an arbitrary system of curvilinear coordinates. Research in the second year was concerned primarily with the problem of grid orthogonality near boundaries. Three approaches investigated to improve the control that the user has over the angle at which grid lines intersect the boundaries were: (1) refinement of the original techniques; (2) development of techniques for marching from a given boundary using the angle as an initial condition; and (3) derivation of a fourth-order system that permits additional boundary conditions on the grid intersection angle. **STATISTICAL ANALYSIS OF DIRECT-STRIKE LIGHTNING DATA (1980 TO 1982)**
L. D. LEE, G. B. FINELLI, M. E. THOMAS, and F. L. PITTS Jan. 1984 30 p refs
(NASA-TP-2252; L-15686; NAS 1.60:2252) Avail: NTIS HC A03/MF A01 CSCL 04B

Electromagnetic measurements are being made during direct lightning strikes by NASA Langley Center using a specially instrumented F-106B aircraft. The research is to aid refinement, characterization, and understanding of the lightning-aircraft interaction process and the lightning hazards to aircraft. Statistical methods are applied to characterize some aspects of the lightning data obtained from 176 strikes to the aircraft. Specific attention is given to the problem of estimating the upper extreme quantiles of the distributions of peak-to-peak values for currents and rates of change in the magnetic and flux densities. A formal treatment via a general location-scale family of models allows the estimation method to be adapted to the realized shapes the distributions. The shapes are examined by probability plotting methods. Author

A limited set of in situ aircraft and ground-based radar data acquired during the 1981 and 1982 Joint Agency Turbulence Experiment are used to study the relationship of aircraft lightning strikes to storm precipitation, turbulence severity, and wind shear. The strikes are found to be strongly correlated with vertical drafts, predominantly downdrafts. The strikes were also well correlated with regions of strong turbulence. However, since most strong turbulence episodes were not associated with lightning, use of lightning location methods to locate hazardous turbulence within storms is considered unreliable. The strikes occurred in storm regions having radar reflectivity factor between 25 to 35 dBZ. These regions were generally on the boundaries of the dominant storm precipitation cores. Storm wind shear was frequently high in regions near aircraft strikes. The strong correlations with strong turbulence, downdraft boundaries, and precipitation core boundaries suggest that the strikes occurred in regions of charge separation. GRA

**INTERACTION BETWEEN CONTROLLING, PLANNING, AND FAULT MANAGING IN COMPLEX MAN-MACHINE SYSTEMS**
G. JOHANNSEN (Kassel, Gesamthochschule, West Germany) IN: A bridge between control science and technology. Volume 5 . Oxford and New York, Pergamon Press, 1985, p. 2541-2545. refs

The three main task categories in man-machine systems are controlling, planning, and fault managing which are briefly explained in the paper. Their interaction is illustrated schematically with a block diagram and further outlined using Rasmussen's cognitive levels of behaviour. Two paradigms, namely car driving and aircraft piloting, exemplify the nature of the interaction in more detail, partially based on experimental results. The state-of-the-art in modelling these task categories and their interaction is discussed with an emphasis on qualitative vs. quantitative models using control theory, artificial intelligence techniques, and fuzzy set theory. Model-based support and expert systems are mentioned as an important future application. Author

Readiness of operational units, especially Fleet Air Reconnaissance Squadron TWO (VQ-2), is difficult to assess, particularly during operational cycles when the units are fulfilling their missions. This effort was conducted to develop a readiness training assessment system for VQ-2 to provide accurate, timely, and efficient assessments of the operational readiness of aircrew personnel while maintaining the highest possible state of readiness to perform the squadron's mission. The readiness training system for maintaining readiness and training data for VQ-2 aircrew personnel consists of: (1) a matrix for the EP-3E and the EA-3B aircraft of all the events that affect the readiness of the personnel assigned to the 10 crew positions in the EP-3E and the 5 crew positions in the EA-3B for each of the four VQ-2 mission area; (2) a computer-managed system to enter, process, store, and produce the readiness training manual that contains all VQ-2's references on training and readiness. J. J. MOYER Sep. 1985 66 p
(AD-A162241; AFIT/GSM/XPX/85S-24) Avail: NTIS HC A04/MF A01 CSCL 15E

The process of life support equipment development and acquisition is examined. This research identified the how the present process works, and the problems of the process. The research was limited to the development and acquisition of life support equipment for tactical aircraft. However, most of the problems and steps of the process are shared by life support equipment programs for other users. The process was determined by referring to applicable regulations and interviewing people involved in the process. Problems were identified during interviews, and by examining the process as a whole. Seven problems are identified, of which five are considered correctable in the current defense acquisition framework. Four of the five problems deal with the management of the acquisition and development process, and combined indicate the lack of an integrated approach. Solutions were developed from suggestions obtained during the interviews and through qualitative analysis of the problems. An integrated solution is proposed in the recommendations. GRA

**1985 SUMMER COMPUTER SIMULATION CONFERENCE, CHICAGO, IL, JULY 22-24, 1985, PROCEEDINGS**

Conference sponsored by the Society for Computer Simulation. San Diego, CA, Society for Computer Simulation, 1985, 791 p. For individual items see A86-30352 to A86-30362.

Simulation methods are discussed, taking into account a microcomputer-based integrated simulation support (MISS) system, a production system analysis language for SLAM simulation modeling, model and program structuring for discrete systems simulation, a simulation language for microcomputers, an interactive continuous-system simulation language, and the concept of a general purpose model description language. Other topics explored are related to computer systems, simulation credibility and validation, physical and engineering sciences, data communication systems, chemical sciences, energy, biomedical simulation, environmental sciences, management and the social sciences, training and research simulators, government simulation/computation activities, CAD/CAM and manufacturing systems, artificial intelligence, simulation of discrete systems, and flight simulation systems. Attention is given to industrial automation, resource planning/scheduling, advanced mathematical techniques in chemical science, and dynamical systems in chemical engineering. G.R.

**ALL ABOUT SIMULATORS, 1984; PROCEEDINGS OF THE SIMULATORS CONFERENCE, NORFOLK, VA, APRIL 18-20, 1984**

V. AMICO, ED. and A. B. CLYMER, ED. Conference sponsored by the Society for Computer Simulation. La Jolla, CA, Society for Computer Simulation (Simulation Series. Volume 14, No. 1), 1984, 325 p. No individual items are abstracted in this volume.

Aspects of simulator development technology are explored, taking into account finite sets of nonlinear algebraic equations in real time, the numerical solution of differential algebraic equation systems, the design and implementation of a discrete time model for real time digital simulation, the development of a configuration management program for nuclear power plant simulators, and application software documentation standards for generating station simulators. Other subjects discussed are related to training with simulators, the simulator industry and its customers, and simulators for research/development/engineering. Attention is given to an electrical simulator for solving linear and nonlinear partial differential equations with an iterative method for refining approximate solutions, a simulator of an intelligent preprocessing image system, tactical software modeling for flight simulators, high-speed simulation of transients in nuclear power plants, a novel idea for microprocessor based simulation training, and a graduate curriculum for simulation/training professionals. **SMOOTHING PATCHED GRIDS**

D. C. WILSON (Florida, University, Gainesville) Computers and Fluids (ISSN 0045-7930), vol. 14, no. 1, 1986, p. 11-22. refs (Contract AF-AFOSR-83-0158)

The purpose of this paper is to indicate how smoothing techniques can be utilized in the area of grid generation. The focus of the paper is to show how one global grid can be patched together from a number of smaller ones. The procedure usually takes place in two steps. First, one global grid is patched together from a number of smaller ones, allowing for the possibility that the derivatives along common boundaries may not be continuous. The second step is to then approximate this grid by a smooth one in such a way that the essential structure of each patch is preserved. Author

**NEW CLASS OF FEATURES FOR PATTERN RECOGNITION AND IMAGE ANALYSIS**

W. C. CHOATE (Texas Instruments Computer Science Laboratory, Dallas) IN: Architectures and algorithms for digital image processing II; Proceedings of the Meeting, Los Angeles, CA, January 24, 25, 1985 . Bellingham, WA, Society of Photo-Optical Instrumentation Engineers, 1985, p. 179-184.

A class of features, called 'edge features', has been developed and applied to several problems of practical interest in image processing. These features are derived from a vector-valued function of the image called the 'edge spectrum'. The edge spectrum at coordinate (x,y) of the image describes the distribution of edge directions near (x,y). Several applications of edge features are discussed. One is considered in some detail. This application is to identify friendly aircraft descending for landing on an aircraft carrier. Identification is achieved by measuring wingspan - a good discriminant between the A6, A7, E2C and F14 aircraft. For this purpose an edge feature was designed for locating the wing tips in the image. Wingspan was converted to physical dimension using range information and the known parameters of the optical system. Author

**MINIMAX FREQUENCY DOMAIN OPTIMIZATION OF MULTIVARIABLE LINEAR FEEDBACK SYSTEMS**

H. KWAKERNAAK (Twente, Technische Hogeschool, Enschede, Netherlands) IN: A bridge between control science and technology. Volume 1 . Oxford and New York, Pergamon Press, 1985, p. 19-24. refs

The minimax optimization of a linear feedback system sensitivity matrix and complement is generalized to the multivariable case. It is assumed that the plant has equally as many inputs as outputs, and it is noted that the solution is generally nonunique. Using the example of the plant which is constituted by the longitudinal dynamics of the CH-47 helicopter control system, the system is shown to produce realistic designs, and a solution of reduced degree is obtained at a lambda of approximately 4.74047. R.R.

**A86-33134**

**ON THE DEVELOPMENT OF EQUIOBSERVABLE FORMS WITH APPLICATION TO ADAPTIVE CONTROL**

H. OHTA (Nagoya University, Japan), M. M. GUPTA, and P. N. NIKIFORUK (Saskatchewan, University, Saskatoon, Canada) IN: A bridge between control science and technology. Volume 1 . Oxford and New York, Pergamon Press, 1985, p. 165-170. refs
(Contract NSERC-A-5625; NSERC-A-1080)

Three types of equiobservable forms are presented for linear time-invariant multivariable systems. These forms are developed using a nonminimal realization of a system and have properties that are useful in the analysis and design of state observation and parameter identification problems. By employing the third form, the state equation can be expressed by using filtered values generated from inputs and outputs in an algebraic form, and a new state observer can be obtained. To illustrate the application of the third form, a multivariable adaptive observer is also discussed. This observer is used to design a two-level adaptive flight controller for the pitch attitude control system of an aircraft. This approach appears to overcome some of the limitations that are inherent in the design of the linear optimal control and conventional adaptive control methods. In particular, the feedback gains of the optimal controller are updated using the estimation provided by the adaptive observer. The first-level of control consists of updated feedforward and optimal controllers. The second-level control is an error servo which provides fine compensation. Extensive simulation studies were carried out and some results are provided for the pitch attitude control of a STOL aircraft under two different flight conditions. Author

**PROGRAMMABLE HAND CALCULATORS IN AVIATION SPORT**

A. ROMANYUK *In its* USSR Report: Cybernetics, Computers and Automation Technology (JPRS-UCC-86-003) p 18-23 20 Mar. 1986 Transl. into ENGLISH from Krylya Rodiny (Moscow, USSR), no. 7, Jul. 1985 p 15-16
Avail: NTIS HC A04/MF A01

This research proposes that the MK-54 programmable hand calculator be used as a computer that calculates the points of participants in glider competitions. The cost of this and similar calculators (MK-56, BZ-34) varies between 50 and 100 rubles. The calculators feature a simple programming system, are easy to use and can muster most of the computational power required. It can execute point calculations in different glider class competitions when draws occur both in speed and distance competitions for any combination of finishers. The set-up time to run the calculations is less than 5 minutes, and the time required to calculate the results of one participant is less than 12 seconds. The program has been used in judging oblast competitions. A simplified flow chart of the algorithm used is presented, and a chart of the addressed registers is given. Author

Digital Flight Control System (DFCS) software was used as a test case for assertion testing. The assertions were written and embedded in the code, then errors were inserted (seeded) one at a time and the code executed. Results indicate that assertion testing is an effective and efficient method of detecting errors in flight software. Most errors are eliminate at an earlier stage in the development than before. Assertions are used to dynamically test fault tolerant flight software. The experiment showed that 87% of typical errors introduced into the program would be detected by assertions. Detailed analysis of the test data showed that the number of assertions needed to detect those errors could be reduced to a minimal set. The analysis also revealed that the most effective assertions tested program parameters that provided greater indirect (collateral) testing of other parameters. Author

A methodology for testing fault tolerant software is presented. There are problems associated with testing fault tolerant software because many errors are masked or corrected by voters, limiter, or automatic channel synchronization. This methodology illustrates how the same strategies used for testing fault tolerant hardware can be applied to testing fault tolerant software. For example, one strategy used in testing fault tolerant hardware is to disable the redundancy during testing. A similar testing strategy is proposed for software, namely, to move the major emphasis on testing earlier in the development cycle (before the redundancy is in place) thus reducing the possibility that undetected errors will be masked when limiters and voters are added. Integrating and differentiating matrices allow the numerical integration and differential of functions whose values are known at points of a discrete grid. Previous derivations of these matrices were restricted to one dimensional grids or to rectangular grids with uniform spacing in at least one direction. Integrating and differentiating matrices were developed for grids with nonuniform spacing in both directions. The use of these matrices as operators to reformulate boundary value problems on rectangular domains as matrix problems for a finite dimensional solution vector is considered. The method requires nonuniform grids which include near boundary points. An eigenvalue problem for the transverse vibrations of a simply supported rectangular plate is solved to illustrate the method. Author

The feasibility of embedding training software in modern flight aircraft to maintain pilot proficiency while parked was investigated. Candidate training scenarios critical to pilot performance were identified. Feasibility was demonstrated based on current and projected capabilities of the AYK-14 mission computers performing the weapons and navigation calculations in the Navy's F/A-18 Hornet. It was shown that the version 6 AYK-14 computer with dual single card processors (SCP's) would provide a suitable host for training software. The F/A-18 avionic and display systems are also shown to support the SAFES (Static Aircraft Flight Environment Simulator) concept. A number of candidate SAFES implementations are defined and one selected for feasibility demonstration remove fastener. Author (GRA)

In the future, aircraft employing active control technology must use highly reliable multiprocessors in order to achieve flight safety. Such computers must be experimentally validated before they are deployed. This project outlines a methodology for doing fault-free validation of reliable multiprocessors. The methodology begins with baseline experiments, which test single phenomenon. As experiments progress, tools for performance testing are developed. This report presents the results of interrupt baseline experiments performed on the Fault-Tolerant Multiprocessor (FTMP) at NASA-Langley's AIRLAB. Interrupt-causing excepting conditions were tested, and several were found to have unimplemented interrupt handling software while one had an unimplemented interrupt vector. A synthetic workload model for realtime multiprocessors is then developed as an application level performance analysis tool. Details of the workload implementation and calibration are presented. Both the experimental methodology and the synthetic workload model are general enough to be applicable to reliable multi-processors besides FTMP. Author

The purpose of this paper is to indicate how smoothing techniques from Differential Topology can be applied to the area of algebraic grid generation in Computational Fluid Dynamics. The basic method is to patch together one global grid from a number of smaller ones. The smoothing theory allows one to blend the grid from one section into the grid of an adjacent one.

**MANEUVERS FOR AIRCRAFT NOISE REDUCTION IN TAKEOFF, CLIMB, AND LANDING APPROACH OPERATIONS [MANIOBRAS PARA LA DILUCION DEL RUIDO AERONAUTICO EN LAS OPERACIONES DE DESPEGUE, SUBIDA Y APROXIMACION AL ATERRIZAJE]**
M. CUESTA IAA/Ingenieria Aeronautica y Astronautica (ISSN 0020-1006), Dec. 1985, p. 31-37. In Spanish. refs

The present evaluation of the characteristics and comparative effectiveness of maneuvers undertaken to reduce aircraft noise levels (due primarily to propulsion system acoustical characteristics) to mandated values gives attention to such representative aircraft as the B747, DC-10-30, B756/767, A310, and A320. Detailed results are presented from studies conducted to ascertain the noise levels generated by different reduced power takeoff regimes and steep landing approach descent trajectories. O.C.

**NOISE EMISSION FROM JET AIRCRAFT DURING TAKE-OFF ROLL WITH RESPECT TO NOISE EXPOSURE CALCULATIONS**
C. SVANE, B. PLOVSING (Danish Acoustical Institute, Lingby, Denmark), and R. HIGGINSON (National Physical Laboratory, Teddington, England) IN: Inter-noise 85; Proceedings of the Fourteenth International Conference on Noise Control Engineering, Munich, West Germany, September 18-20, 1985. Volume 1 . Dortmund, West Germany, Bundesanstalt fuer Arbeitsschutz, 1985, p. 315-318. Research sponsored by the European Economic Community, Danish National Agency of Environmental Protection and Danish Directorate of Civil Aviation.

The effect of forward speed on aircraft noise emission during takeoff ground-roll is studied. Preliminary results are reported for noise levels measured along a runway at the Copenhagen Kastrup Airport. The general trends of these findings is that noise levels decrease along the runway and that the effect of forward speed on noise emission is higher for low bypass ratio engines than for high bypass ratio engines. A prediction method suitable for incorporation into computer models for airport noise contours is discussed. C.D.

**AIRCRAFT NOISE - DIFFERENT WAYS TO MONITOR THE NOISE LOAD**
G. BEKEBREDE (Nationaal Lucht- en Ruimtevaartlaboratorium, Amsterdam, Netherlands) IN: Inter-noise 85; Proceedings of the Fourteenth International Conference on Noise Control Engineering, Munich, West Germany, September 18-20, 1985. Volume 2 . Dortmund, West Germany, Bundesanstalt fuer Arbeitsschutz, 1985, p. 775-778.

Measures taken by the Dutch government to reduce aircraft-noise disturbances including the establishment of noise zones in which subsequent building is forbidden, while already existing homes are provided with noise insulation are discussed. To ensure accurate noise monitoring, the following recommendations were made by the NLR: (1) regular noise load calculations, utilizing aircraft noise and performance data, the air traffic mix, and flight route information; (2) flight track monitoring, performed by a computerized Flight Track and Aircraft Noise Monitoring System which identifies all aircraft deviating from the prescribed track (i.e., flying over congested regions); and (3) actual noise monitoring, to guard the noise level at a specific noise-sensitive area in close proximity to the airfield, such as a hospital. **CHARACTERISTICS OF BACK-RADIATED DEPARTURE NOISE AT SAN FRANCISCO INTERNATIONAL AIRPORT**
A. D. FEENER (San Francisco International Airport, CA) and W. K. CONNOR (Tracor Applied Sciences, Inc., Austin, TX) IN: Inter-noise 85; Proceedings of the Fourteenth International Conference on Noise Control Engineering, Munich, West Germany, September 18-20, 1985. Volume 2 . Dortmund, West Germany, Bundesanstalt fuer Arbeitsschutz, 1985, p. 779-782.

In response to community concerns, the San Francisco International Airport initiated a study to determine the characteristics of disturbing noise, investigate the factors involved, and develop abatement procedures and policies. Field data were obtained at three sites (two elevated, one at runway level) with a tape recorder connected directly to the noise-monitoring-terminal microphone preamplifier output (which contains an A-weighing circuit). Two noise events were produced by departing planes, the first corresponding to takeoff roll, the second to climbout. Deck angle change, atmospheric refraction effects, and a decrease in ground attenuation are all contributing factors. A difference in spectral shape was found between the first event at a site situated at runway elevation and all other events. In the latter, greater excess attenuation from atmospheric and ground effects caused a concentration of energy in the low-frequency range. The question of the underestimation of impact by the monitoring system was subsequently addressed, and it was concluded that the noise level versus time patterns were unusual and call for special considerations in monitoring community noise. K.K.

### NOISE OF MILITARY AIRCRAFT IN THE RANGE OF AIRPORTS AND AT LOW LEVEL FLIGHTS

V. HANS (Kaiserslautern, Universitaet, West Germany) IN: Inter-noise 85; Proceedings of the Fourteenth International Conference on Noise Control Engineering, Munich, West Germany, September 18-20, 1985. Volume 2 . Dortmund, West Germany, Bundesanstalt fuer Arbeitsschutz, 1985, p. 783-786.

Military airport noise differs from that of civilian airports in its origins, characteristics, and potential effects. While civilian aircraft frequency spectra are characterized by amplitudes ranging from 75 dB(A) to 85 dB(A), military aircraft amplitudes can range from 70 dB(A) to 120 dB(A). The validity of the equivalent continuous sound level (Leq) as a measure of aircraft noise is evaluated, and the distribution of sound level versus time at various distances is indicated schematically for low-flying aircraft. The distribution reaches 75-80 dB(A) at 5 sec, after which the distribution goes to a plateau at 80-90 dB(A) in a period of 5-10 sec. Low level flights exhibit sound levels greater than 95 dB(A). Through an analysis of these distributions, plotted during landing approach and low-level flights, it is concluded that the Leq is a poor measure of aircraft disturbance. K.K.

**A86-31964#**

### COMPARISON OF DIFFERENT AIRCRAFT NOISE EXPOSURE INDICES IN FLIGHT CORRIDORS NEAR AIRPORTS

T. J. MEYER IN: Inter-noise 85; Proceedings of the Fourteenth International Conference on Noise Control Engineering, Munich, West Germany, September 18-20, 1985. Volume 2 . Dortmund, West Germany, Bundesanstalt fuer Arbeitsschutz, 1985, p. 1057-1060.

Noise indices based on the integration of exposed sound energy can be readily converted from one to another if the same measure for noise exposure is used. It is noted that dB(A) and PNdB can be converted satisfactorily if the distances and corresponding noise spectra of the noisiest starting and landing aircraft contained in the index are known. Approximations of these conversion relationships must take into account either the noise events of a single flight corridor, or the maximum noise levels of aircraft flying outside the flight corridor. They should be within the limits of noise levels of aircraft flying within the corridor. It is concluded that, before using these approximations, it must be determined whether or not an exact calculation with energy equivalent integration is necessary. K.K.

### THE GERMAN-DUTCH WIND TUNNEL - AN AEROACOUSTICS EXPERIMENTATOR'S DREAM

H. HELLER, W. DOBRZYNSKI, W. SPLETTSTOESSER, and K. SCHULTZ (DFVLR, Institut fuer Entwurfs-Aerodynamik, Brunswick, West Germany) IN: Inter-noise 85; Proceedings of the Fourteenth International Conference on Noise Control Engineering, Munich, West Germany, September 18-20, 1985. Volume 2 . Dortmund, West Germany, Bundesanstalt fuer Arbeitsschutz, 1985, p. 1091-1094.

The German-Dutch Wind Tunnel/DNW, when used in the acoustic mode, provides a realistic environment for aeroacoustic testing and high-quality data. Two research projects are discussed: (1) helicopter noise research, which concerns itself with high speed impulsive noise and blade/vortex interaction impulsive noise; and (2) propeller noise research. The data obtained proved to be excellent, and in the case of propeller noise research, such data could not have been obtained through flight tests. K.K.

**A86-31966#**

### PROGRESS TOWARDS INTERNATIONAL STANDARDISATION OF AIRCRAFT NOISE CONTOUR CALCULATIONS

R. F. HIGGINSON (National Physical Laboratory, Teddington, England) IN: Inter-noise 85; Proceedings of the Fourteenth International Conference on Noise Control Engineering, Munich, West Germany, September 18-20, 1985. Volume 2 . Dortmund, West Germany, Bundesanstalt fuer Arbeitsschutz, 1985, p. 1413-1415.

There is a need for standardization in noise contour calculations as evidenced by the fact that there is disagreement between nations, and within nations over the following: (1) the data base of individual aircraft noise and performance information; (2) the model formulas used; and (3) the noise index by which output is expressed. Though none of the current efforts being directed towards standardization are addressing the question of noise indices, three international organizations are making headway, the ECAC, the SAE, and the ICAO. The ECAC has established a format for basic aircraft noise and performance information; the SAE has published a prediction method for lateral attenuation of noise during aircraft takeoff and landing; and the ICAO has developed a method of deriving basic noise data and computing noise contours. K.K.

### THE DEVELOPMENT OF DICHROMATED GELATIN FOR HOLOGRAPHIC OPTICAL ELEMENT APPLICATIONS

R. W. EVANS (Pilkington Bros., PLC, Research and Development Laboratories, Ormskirk, England) IN: Applications of holography; Proceedings of the Meeting, Los Angeles, CA, January 21-23, 1985 . Bellingham, WA, SPIE - The International Society for Optical Engineering, 1985, p. 302-304.

A practical industrial process has been developed for manufacturing holographic optical elements (HOEs), based on dichromated gelatin. The holograms consist of multilayer gelatin thin films having a fluctuating refractive index. The process of manufacturing the films involves recording light sensitive, dichromated gelatin layers and depositing them on to substrates. The films are in turn exposed to optical interference fringes which are produced using laser light. The pattern of light and dark fringes is recorded in the gelatin and transformed to a modulation of the refractive index by washing and swelling the gelatin in water, followed by rapid dehydration in a propanaol solution. Recent development work on thin films of 4-7 microns and thick films of about 60 microns has extended the diffraction efficiency near maximum for both planar and Bragg hologram types. The application of HOEs to Heads-Up Display systems for aircraft is discussed. I.H.

**ULTRASONIC CHARACTERIZATION OF MICROSTRUCTURE IN POWDER METAL ALLOY**

B. R. TITTMANN, L. A. AHLBERG, and K. FERTIG *In* NASA. Lewis Research Center Analytical Ultrasonics in Materials Research and Testing p 31-47 Jan. 1986 refs
(Contract W-7405-ENG-82)
Avail: NTIS HC A16/MF A01 CSCL 20A

The ultrasonic wave propagation characteristics were measured for IN-100, a powder metallurgy alloy used for aircraft engine components. This material was as a model system for testing the feasibility of characterizing the microstructure of a variety of inhomogeneous media including powder metals, ceramics, castings and components. The data were obtained for a frequency range from about 2 to 20 MHz and were statistically averaged over numerous volume elements of the samples. Micrographical examination provided size and number distributions for grain and pore structure. The results showed that the predominant source for the ultrasonic attenuation and backscatter was a dense (approx. 100/cubic mm) distribution of small micropores (approx. 10 micron radius). Two samples with different micropore densities were studied in detail to test the feasibility of calculating from observed microstructural parameters the frequency dependence of the microstructural backscatter in the regime for which the wavelength is much larger than the size of the individual scattering centers. Excellent agreement was found between predicted and observed values so as to demonstrate the feasibility of solving the forward problem. The results suggest a way towards the nondestructive detection and characterization of anomalous distributions of micropores when conventional ultrasonic imaging is difficult. The findings are potentially significant toward the application of the early detection of porosity during the materials fabrication process and after manufacturing of potential sites for stress induced void coalescence leading to crack initiation and subsequent failure.

Acoustic and diagnostic data that were obtained to determine the influence of selected geometric and aerodynamic flow variables of coannular nozzles with thermal acoustic shields are summarized in this comprehensive data report. A total of 136 static and simulated flight acoustic test points were conducted with 9 scale-model nozzles The tested nozzles included baseline (unshielded), 180 deg shielded, and 360 deg shielded dual flow coannular plug configurations. The baseline configurations include a high radius ratio unsuppressed coannular plug nozzle and a coannular plug nozzle and a coannular plug nozzle with a 20-chute outer stream suppressor. The tests were conducted at nozzle temperatures and pressure typical of operating conditions of variable cycle engine.

**THE RELATIVE EFFECT OF NOISE AT DIFFERENT TIMES OF DAY: AN ANALYSIS OF EXISTING SURVEY DATA**

J. M. FIELDS Washington NASA Apr. 1986 80 p refs
(Contract NAS1-16978; DTFA01-834-10564)
(NASA-CR-3965; NAS 1.26:3965) Avail: NTIS HC A05/MF A01 CSCL 20A

This report examines survey evidence on the relative impact of noise at different times of day and assesses the survey methodology which produces that evidence. Analyses of the regression of overall (24-hour) annoyance on noise levels in different time periods can provide direct estimates of the value of the parameters in human reaction models which are used in environmental noise indices such as LDN and CNEL. In this report these analyses are based on the original computer tapes containing the responses of 22,000 respondents from ten studies of response to noise in residential areas. The estimates derived from these analyses are found to be so inaccurate that they do not provide useful information for policy or scientific purposes. The possibility that the type of questionnaire item could be biasing the estimates of the time-of-day weightings is considered but not supported by the data. Two alternatives to the conventional noise reaction model (adjusted energy model) are considered but not supported by the data.

**CONSIDERATION OF SOME FACTORS AFFECTING LOW-FREQUENCY FUSELAGE NOISE TRANSMISSION FOR PROPELLER AIRCRAFT**

J. S. MIXSON and L. A. ROUSSOS Apr. 1986 28 p refs
(NASA-TP-2552; L-14994; NAS 1.60:2552) Avail: NTIS HC A03/MF A01 CSCL 20A

Possible reasons for disagreement between measured and predicted trends of sidewall noise transmission at low frequency are investigated using simplified analysis methods. An analytical model combining incident plane acoustic waves with an infinite flat panel is used to study the effects of sound incidence angle, plate structural properties, frequency, absorption, and the difference between noise reduction and transmission loss. Analysis shows that these factors have significant effects on noise transmission but they do not account for the differences between measured and predicted trends at low frequencies. An analytical model combining an infinite flat plate with a normally incident acoustic wave having exponentially decaying magnitude along one coordinate is used to study the effect of a localized source distribution such as is associated with propeller noise. Results show that the localization brings the predicted low-frequency trend of noise transmission into better agreement with measured propeller results. This effect is independent of low-frequency stiffness effects that have been previously reported to be associated with boundary conditions. Author

(NASA-CR-178079; NAS 1.26:178079; REPT-4054/R128) Avail: NTIS HC A05/MF A01 CSCL 20A

The NASA-Langley Research Center 4 x 7 Meter Low Speed Wind Tunnel is currently being used for low speed aerodynamics, V/STOL aerodynamics and, to a limited extent, rotorcraft noise research. The deficiencies of this wind tunnel for both aerodynamics and aeroacoustics research have been recognized for some time. Modifications to the wind tunnel are being made to improve the test section flow quality and to update the model cart systems. A further modification of the 4 x 7 Meter Wind Tunnel to permit rotorcraft model acoustics research has been proposed. As a precursor to the design of the proposed modifications, NASA is conducted both in-house and contracted studies to define the acoustic environment within the wind tunnel and to provide recommendations or the reduction of the wind tunnel background noise to a level acceptable to acoustics researchers. One of these studies by an acoustics consultant, has produced the primary reference documents that define the wind tunnel noise sources and outline recommended solutions. Author

The investigation of a new concept for measurement of distributed strain is described. Implementation of the technique utilizes a fiber optic device with twin, coupled cores, a single input and a single output. Multiple wavelength operation of the sensor yields a diagnosis of the waveguide coupling perturbations imposed by mechanical disturbances. A general theory for the device has been derived in the form of an integral equation that relates the sensor core contrast to an arbitrary bending strain or curvature. In many cases of interest the curvature is small and slowly varying. For these conditions theory shows the core crosstalk spectrum is directly related to the Fourier transform of the strain distribution on a cantilevered beam. GRA

**IMPACT OF RELIABILITY/MAINTAINABILITY (R/M) ON LOGISTICS COSTS FOR USAF AIRCRAFT**
A. J. SHERBO and J. LOCHBAUM 20 Sep. 1985 42 p Presented at the 19th Annual Department of Defense Cost Analysis Symposium, Leesburg, Va., 17-20 Sep. 1985
(AD-A162204) Avail: NTIS HC A03/MF A01 CSCL 15E

The purpose of this study is to develop some cost estimating relationships (CERs) that supports the contention that higher R&M results in lower logistics support costs, and can be used in a variety of ways. Our primary need is a methodology that enables us to quantify the impact of R&M changes or levels on existing and new aircraft in terms of logistics support costs. The CERs we are searching for need to be at the weapon system level as opposed to the subsystem or component level. GRA

**COMPARISON OF QUANTITY VERSUS QUALITY USING PERFORMANCE, RELIABILITY, AND LIFE CYCLE COST DATA. A CASE STUDY OF THE F-15, F-16, AND A-10 AIRCRAFT M.S. Thesis**
D. C. MERKER Sep. 1985 100 p
(AD-A162238; AFIT/GSM/LSQ/85S-23) Avail: NTIS HC A05/MF A01 CSCL 14A

The quantity versus quality issue is examined and a cost-effectiveness model designed to aid in evaluating it. This model incorporates mission effectiveness, readiness, and life cycle costs. The research effort was hinged around a case study comparison of the F-15, F-16, and A-10 aircraft. These aircraft were chosen because they represented varying system complexities and were used as surrogates to high, medium, and low complexity respectively. The comparisons made were intended to demonstrate the usefulness of using aircraft effectiveness, readiness and cost data in a mathematical cost-effectiveness model. The methodology followed combined multi-attribute value theory, aircraft readiness data, and aircraft life cycle cost information. The result was a series of cost-effectiveness ratios, and a cost-effectiveness curve which incorporated the three close air support aircraft. The cost-effectiveness curve provided the costs, adjusted by both effectiveness and readiness values. Author (GRA)

**AN EVALUATION OF CPRA (COST PERFORMANCE REPORT ANALYSIS) ESTIMATE AT COMPLETION TECHNIQUES BASED UPON AFWAL (AIR FORCE WRIGHT AERONAUTICAL LABORATORIES) COST/SCHEDULE CONTROL SYSTEM CRITERIA DATA M.S. Thesis**
J. B. PRICE Sep. 1985 67 p
(AD-A162282; AFIT/GSM/LSY/85S-28) Avail: NTIS HC A04/MF A01 CSCL 14B

This thesis examined techniques used to derive estimates of the cost at completion for various research and development programs. The six methods examined were the methods used in the Cost Performance Report Analysis (CPRA) computer program to calculate estimates at completion. The analysis is based on a linear regression between the cost at completion for each technique available. The techniques were ranked by coefficient of determination and a general linear test was performed to test for equality among the regression lines. The results of this investigation indicate that an estimate at completion based upon weighted cost and schedule indices minimizes the unexplained error (as a percentage of total error) and is thought to be the superior forecaster of costs at completion. The general linear test for equality among the regression lines generated by the different techniques did not indicate the existence of commonality between regression lines. This means that each technique tested provided a unique estimate at completion. GRA

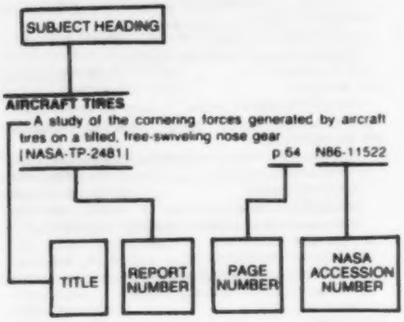
**ACTIVITIES REPORT IN AEROSPACE IN WEST GERMANY Annual Report, 1984**
Aug. 1984 119 p In GERMAN; ENGLISH summary Original contains color illustrations
(ISSN-0070-3966) Avail: NTIS HC A06/MF A01

Research and development in air traffic management; aircraft technology; turbopropulsion and turbomachinery; nonnuclear energy systems; satellite communication and localization; remote sensing of the Earth; space systems; advanced technologies; and technology transfer are summarized. Project management, organization, DFVLR personnel, and financial development are presented. Author (ESA)

# SUBJECT INDEX

### Typical Subject Index Listing



The subject heading is a key to the subject content of the document. The title is used to provide a description of the subject matter. When the title is insufficiently descriptive of the document content, the title extension is added, separated from the title by three hyphens. The (NASA or AIAA) accession number and the page number are included in each entry to assist the user in locating the abstract in the abstract section. If applicable, a report number is also included as an aid in identifying the document. Under any one subject heading, the accession numbers are arranged in sequence with the AIAA accession numbers appearing first.

Scientists on aircraft development trends p 407 N86-22545

**AIRCRAFT HAZARDS**
Effects of intense rainfall on the aerodynamics of an airfoil profile p 409 A86-31013
An ill wind --- wind shear p 461 A86-31225
Tomorrow's weather - New accuracy in forecasting p 462 A86-32450
The measurement of aircraft performance and stability and control after flight through natural icing conditions [NASA-TM-87265] p 446 N86-22582
Statistical analysis of direct-strike lightning data (1980 to 1982) [NASA-TP-2252] p 463 N86-24090
Storm precipitation and wind structure during aircraft strike lightning events [AD-A162338] p 463 N86 24100

**AIRCRAFT INDUSTRY**
How Sweden decided to build the Gripen p 405 A86-31340

**AIRCRAFT INSTRUMENTS**
The history of instrument flight p 406 A86-29868
A peripheral integrated system status display - Figural goodness or proximity effects? p 453 A86-29870
Airlines and the new technology aircraft - A discussion paper p 419 A86-31325
New interfaces in the cockpit p 427 A86-31346
Instrumentation of a light twin aircraft for flow energizer flight tests [AIAA PAPER 86-9759] p 438 A86-32099

**AIRCRAFT LANDING**
Maneuvers for aircraft noise reduction in takeoff, climb, and landing approach operations p 467 A86-31010
Glide slope indicator system [AD-D01207] p 424 N86-2358
Improvements to the FATOLA computer program including added actively controlled landing gear subroutines [NASA-CR-166069] p 436 N86-23588

**AIRCRAFT MAINTENANCE**
Helicopter maintenance in the real world p 405 A86-30549
The MRCA automatic test system p 407 N86-22536
Fuzzy inference system to diagnose aircraft hydraulic faults p 407 N86-22775
Depot maintenance of aviation components: Contractor versus organic repair [AD-A162071] p 408 N86-23556

**AIRCRAFT MANEUVERS**
Maneuvers for aircraft noise reduction in takeoff, climb, and landing approach operations p 467 A86-31010
An interpretation of airplane general motion and contol as inverse problem p 443 A86-31661
Modeling of aircraft cruise performance using acceleration and deceleration maneuvers - Results and application [AIAA PAPER 86-9735] p 428 A86-32082
Specific excess power applications for rotary wing aircraft [AIAA PAPER 86-9810] p 431 A86-32137

**AIRCRAFT MODELS**
Modeling of aircraft cruise performance using acceleration and deceleration maneuvers - Results and application [AIAA PAPER 86-9735] p 428 A86-32082
Aerodynamic parameters estimated from flight and wind tunnel data p 410 A86-32782
Analysis of dynamic stability derivatives for high angle of attack aircraft p 414 N86-22546

**AIRCRAFT NOISE**
Maneuvers for aircraft noise reduction in takeoff, climb, and landing approach operations p 467 A86-31010
Noise of the general aviation airplanes influence on environment of the airclub, airfields and on crews p 461 A86-31955
Anatomy of a noise-abatement climb p 419 A86-31956
Aircraft noise - Different ways to monitor the noise load p 467 A86-31959
Characteristics of back-radiated departure noise at San Francisco International Airport p 467 A86-31960
Noise of military aircraft in the range of airports and at low level flights p 468 A86-31961
What should be known on the environmental impact assessment for a planning airport p 462 A86-31962
A quiet STOLport? Convincing the public p 462 A86-31963
Comparison of different aircraft noise exposure indices in flight corridors near airports p 468 A86-31964
Progress towards international standardisation of aircraft noise contour calculations p 468 A86-31966
Mobile Experimental Laboratory (MEL) --- computer system for real-time acoustic and vibration field tests of aircraft [AIAA PAPER 86-9801] p 465 A86-32130
Acoustical design economic tradeoff for transport aircraft --- J p 468 A86-32783

Turbulent boundary-layer wall pressure fluctuations downstream of a tandem LEBU --- Large-Eddy BreakUp devices p 457 A86-3298[illegible]
Improved Y-7, Y-12 aircraft described p 436 N86-22572
La Recherche Aerospatiale, bimonthly bulletin, number 1985-1, 224/January-February [ESA-TT-915] p 458 N86-22729
The relative effect of noise at different times of day: An analysis of existing survey data [NASA-CR-3965] p 469 N86-24392
Consideration of some factors affecting low-frequency fuselage noise transmission for propeller aircraft [NASA-TP-2552] p 469 N86-24393

**AIRCRAFT PERFORMANCE**
X-29A advanced technology demonstrator program overview [AIAA PAPER 86-9727] p 428 A86-32076
Modeling of aircraft cruise performance using acceleration and deceleration maneuvers - Results and application [AIAA PAPER 86-9735] p 428 A86-32082
Combined test force operations at the Air Force Flight Test Center [AIAA PAPER 86-9739] p 406 A86-32085
Single heading climbs - An alternate technique for determining performance --- in jet transport flight tests [AIAA PAPER 86-9757] p 429 A86-32098
High technology test bed program --- for Hercules cargo aircraft [AIAA PAPER 86-9803] p 431 A86-32132
The measurement of aircraft performance and stability and control after flight through natural icing conditions [NASA-TM-87265] p 446 N86-22582
Rollout of XT-4 intermediate class training aircraft p 438 N86-23774

**AIRCRAFT PILOTS**
Air transport pilot involvement in general aviation accidents p 418 A86-29736

**AIRCRAFT PRODUCTION**
A systems engineering methodology for the advanced tactical aircraft [AD-A162049] p 437 N86-23593

**AIRCRAFT RELIABILITY**
The application of fracture mechanics methodology to the damage tolerance analysis of the Boeing 757 airplane p 425 A86-30090
Fatigue crack growth in patched plates under constant amplitude and flight simulation loadings p 454 A86-30092
Combined test force operations at the Air Force Flight Test Center [AIAA PAPER 86-9739] p 406 A86-32085
T-46A flight test results [AIAA PAPER 86-9766] p 429 A86-32103

**AIRCRAFT SAFETY**
Results of the technical investigation of accidents during the operation of German aircraft at home and abroad, and of foreign aircraft in Germany p 420 N86-23578
The impact of a traffic alert and collision avoidance system on the air traffic control radar beacon system and the mode S system in the Los Angeles Basin [FAA-PM-84-30] p 425 N86-23581
Preliminary hazard analysis for self-contained navigation system [AD-A161883] p 425 N86-23582
Lightning protection guidelines and test data for adhesively bonded aircraft structures [NASA-CR-3762] p 436 N86-23586
Storm precipitation and wind structure during aircraft strike lightning events [AD-A162336] p 463 N86-24100

**AIRCRAFT SPECIFICATIONS**
Su-27 - Sukhoi plays its flanker p 427 A86-31344

**AIRCRAFT SPIN**
Flight test simulation of the T-46 [AIAA PAPER 86-9773] p 430 A86-32108
Development of spin resistance criteria for light general aviation airplanes [AIAA PAPER 86-9812] p 443 A86-32139
Energy dissipation of liquids in nutating spherical tanks measured by a forced motion-spin table [AD-A161864] p 460 N86-23874

**AIRCRAFT STABILITY**
The aeromechanics of aircraft: Flight dynamics (2nd revised and enlarged edition) --- Russian textbook p 442 A86-30925
Transient motion of a hypersonic wedge, including time history effects p 443 A86-31662
Development of spin resistance criteria for light general aviation airplanes [AIAA PAPER 86-9812] p 443 A86-32139
The measurement of aircraft performance and stability and control after flight through natural icing conditions [NASA-TM-87265] p 446 N86-22582

**AIRCRAFT STRUCTURES**
Fractographic study of fatigue crack kinetics in bodies and structures p 454 A86-30034
A stress intensity factor solution due to holes ahead of growing cracks in thin sheet material p 454 A86-31123
Plastic torsion of hollow elements of aircraft --- Russian book p 455 A86-31374
A mathematical model for structures consisting of elastic shell sections connected by open girders p 456 A86-31420
New and existing techniques for dynamic loads analyses of flexible airplanes p 432 A86-32787
Nonlinear multimode response of clamped rectangular plates to acoustic loading p 457 A86-32973
Step relaxation method for modal test implemented with frequency-domain preprocessing p 457 A86-32975
Rapid vibration mode analysis of aircraft with external stores p 435 A86-33261
Calculation of structural elements of aircraft: Sandwich plates and shells --- Russian book p 458 A86-33292
More on new IL-96, IL-114 aircraft p 435 N86-22567
Tupolev bureau developing TU-204 passenger jet: Tupolev on features p 435 N86-22568
Details of new Ka-126 helicopter p 435 N86-22569
Improved Y-7, Y-12 aircraft described p 436 N86-22572
Holography: The nondestructive testing of composite structures --- aerospace structures p 458 N86-22611
Activities report of the Department of Aerospace Engineering p 47[illegible] N86-23491
Lightning protection guidelines and test data for adhesively bonded aircraft structures [NASA-CR-3762] p 436 N86-23586
Flexural properties of carbon fibre cloth/wood veneer laminates [AD-A161921] p 452 N86-23663
Design of fuselage shapes for natural laminar flow [NASA-CR-3970] p 460 N86-23852

**AIRCRAFT TIRES**
Investigation of main landing gear tire temperatures during taxy-out at heavy take-off masses [AIAA PAPER 86-9778] p 430 A86-32113

**AIRFIELD SURFACE MOVEMENTS**
RASP - A system generating very accurate position markers during flight testing --- RAdiographic Spotting of Position of aircraft [AIAA PAPER 86-9802] p 422 A86-32131
A review of computer simulations for aircraft-surface dynamics p 432 A86-32776
Simulation of aircraft taxi testing on the AGILE shaker test facility p 448 A86-33265

**AIRFOIL PROFILES**
Effects of intense rainfall on the aerodynamics of an airfoil profile p 409 A86-31013
Experimental and theoretical study of wings with blunt trailing edges p 410 A86-32789
Airfoil design at sonic velocity p 411 A86-32989
Acta Aerodynamica Sinica (selected articles) [AD-A162993] p 417 N86-23575

**AIRFOILS**
Improved numerical method for lifting airfoils with oscillating control surfaces in subsonic flow p 409 A86-31021
Comparative study between two Navier-Stokes algorithms for transonic airfoils p 411 A86-32966
Dynamic stall inception correlation for airfoils undergoing constant pitch rate motions p 411 A86-32978
Numerical modeling of transonic flows over airfoils and cascades p 414 A86-33409
Numerical analysis of inviscid flows About wing-fuselage combinations. Part 1: Development of grid generation code YOKUDO-G [NAL-TR-864] p 414 N86-22551
Thermal barrier coating life prediction model development [NASA-CR-175087] p 452 N86-22713
Coupling linearized far-field boundary conditions with nonlinear near-field solutions in transonic flow [AD-A162334] p 417 N86-23573
Investigations in the flow field of airfoils with various geometries in the domain of high angles of attack. Experimental investigations [REPT-A-13/85] p 418 N86-23576
USAF/SCEEE (United States Air Force/Southeastern Center for Electrical Engineering Education) Research Initiation Program research reports, volume 2 [AD-A161908] p 460 N86-23752

**AIRFRAME MATERIALS**
Variation of anisotropic behaviour in structural optimization --- for fiber reinforced airframes p 434 A86-33258

**AIRFRAMES**
Durability and damage-tolerance design and analysis of titanium airframe structures p 454 A86-30091
A study of the effect of certain factors on the fatigue strength of structural irregularities in the airframe of aircraft p 427 A86-31413
The US Army's LHX (light helicopter family) program [AD-A161949] p 437 N86-23591

**AIRLINE OPERATIONS**
The private enterprise factor in regional airlines p 421 A86-31004
Major short-haul role seen for tilt-rotor aircraft p 420 A86-33427

**AIRPORT PLANNING**
Trends in the design of airfield radars p 421 A86-31008
The extension of the Madeira airport runway - A unique task p 447 A86-31012
What should be known on the environmental impact assessment for a planning airport p 462 A86-31962

**AIRPORTS**
Noise of the general aviation airplanes influence on environment of the airclub, airfields and on crews p 461 A86-31955
Characteristics of back-radiated departure noise at San Francisco International Airport p 467 A86-31960
Noise of military aircraft in the range of airports and at low level flights p 468 A86-31961
A quiet STOLport? Convincing the public p 462 A86-31963
Comparison of different aircraft noise exposure indices in flight corridors near airports p 468 A86-31964
Progress towards international standardisation of aircraft noise contour calculations p 468 A86-31966

**ALGORITHMS**
Comparative study between two Navier-Stokes algorithms for transonic airfoils p 411 A86-32966
A preliminary design for flight testing the FINDS algorithm [NASA-CR-178043] p 439 N86-22574
A methodology for airplane parameter estimation and confidence interval determination in nonlinear estimation problems [NASA-RP-1153] p 445 N86-22579

**ALLOCATIONS**
Information on airport and airway trust fund revenues and outlays by states and large airports [PB86-129665] p 449 N86-23609

**ALLOYS**
Ultrasonic characterization of microstructure in powder metal alloy p 469 N86-22964

**ALTITUDE TESTS**
Constant altitude helicopter flight testing [AIAA PAPER 86-9787] p 431 A86-32119

**ALUMINUM ALLOYS**
Spectrum fatigue crack growth behavior of aluminum alloys p 450 A86-30006
Fatigue behaviour of advanced aluminium alloy lugs of 7475-T761 with and without initial cracks p 450 A86-30030
A weak beam transmission electron microscopy study of a fatigue crack tip in a 2024 aluminum alloy p 450 A86-30033
Multipurpose corrosion inhibitors for aerospace alloys in naval environments p 450 A86-33021
Dispersion strengthened P/M aluminium alloys p 451 A86-33223
The development of aluminum-lithium alloys for aerospace applications p 451 N86-22616
Comparison of aluminum alloys concerning strength and damage tolerance --- aircraft construction materials [MBB-UT-111/85] p 452 N86-23714

**ANGLE OF ATTACK**
F-14A low altitude high angle of attack simulation and flight test program [AIAA PAPER 86-9774] p 430 A86-32109
Investigation of vortex patterns on slender bodies at high angles of attack p 410 A86-32784
Analysis of dynamic stability derivatives for high angle of attack aircraft p 414 N86-22546
Validation of USAF stability and control Datcom methodologies for straight-tapered sweptforward wings [AD-A161876] p 417 N86-23570
Investigations in the flow field of airfoils with various geometries in the domain of high angles of attack. Experimental investigations [REPT-A-13/85] p 418 N86-23576

**ANISOTROPIC MEDIA**
Aeroelastic wind tunnel similarity theory for anisotropic aircraft wings p 433 A86-33244

**ANISOTROPIC PLATES**
Anisotropic wing aeroelastic theories with warping effects p 434 A86-33261

**ANISOTROPY**
Variation of anisotropic behaviour in structural optimization --- for fiber reinforced airframes p 434 A86-33258

**ANNULAR NOZZLES**
Throttle dependent forces: A primer [AD-A162939] p 442 N86-23599
**ANTENNA RADIATION PATTERNS**
Considerations on the influence of positioning on the quality of GP ILS information p 421 A86-31007
Radio communication between manoeuvring platforms p 456 A86-31921
**ANTHROPOMETRY**
Survival of helicopter accidents p 419 A86-31005
**APPROACH**
Controlled-Flight-Into-Terrain accidents during unpublished-route radar vectoring p 418 A86-29872
**ARCHITECTURE (COMPUTERS)**
Rivista Technica Selenia, volume 9, number 3, 1985 --- combat aircraft p 407 N86-22537
**ARMED FORCES (UNITED STATES)**
Air Force Flight Test Center range overview [AIAA PAPER 86-9748] p 448 A86-32092
**ARTIFICIAL INTELLIGENCE**
Cockpits for 2010 and beyond p 427 A86-31849
Interaction between controlling, planning, and fault managing in complex man-machine systems p 463 A86-33184
Development experience with a simple expert system demonstrator for pilot emergency procedures [NASA-TM-85919] p 446 N86-23603
**ATLANTIC OCEAN**
The economics of the North Atlantic air traffic system p 419 A86-31324
**ATMOSPHERIC BOUNDARY LAYER**
Analysis of airborne Doppler lidar, Doppler radar and tall tower measurements of atmospheric flows in quiescent and stormy weather [NASA-CR-3960] p 462 N86-23159
**ATMOSPHERIC CIRCULATION**
Storm precipitation and wind structure during aircraft strike lightning events [AD-A162338] p 463 N86-24100
**ATMOSPHERIC ELECTRICITY**
Lightning protection guidelines and test data for adhesively bonded aircraft structures [NASA-CR-3762] p 436 N86-23586
**ATMOSPHERIC TURBULENCE**
Turbulence for flight simulation p 462 A86-32788
**ATTACK AIRCRAFT**
Comparison of quantity versus quality using performance, reliability, and life cycle cost data. A case study of the F-15, F-16, and A-10 aircraft [AD-A162238] p 470 N86-24580
**ATTITUDE CONTROL**
Locally linearized longitudinal and lateral-directional aerodynamic stability and control derivaties for the X-29A aircraft [NASA-TM-84919] p 416 N86-23566
**AUTOCORRELATION**
Raid count by autocorrelation --- performed on radar receiver by reflection from aircraft p 424 A86-32631
Analysis of data from NASA B-57B gust gradient program [NASA-CR-178736] p 446 N86-23604
**AUTOMATIC CONTROL**
After action report, CH-47 recovery using D-PAAC [AD-A161935] p 437 N86-23589
An investigation of synthetic aperture radar autofocus [AD-A161912] p 460 N86-23783
**AUTOMATIC FLIGHT CONTROL**
Knowledge-based approach toward developing an autonomous helicopter system p 421 A86-30488
**AUTOMATIC LANDING CONTROL**
Wind shear estimation by frequency-shaped optimal estimator p 464 A86-31656
**AUTOMATIC TEST EQUIPMENT**
Grumman's real time computing system for avionics testing [AIAA PAPER 86-9732] p 464 A86-32079
Rivista Technica Selenia, volume 9, number 3, 1985 --- combat aircraft p 407 N86-22537
The MRCA automatic test system p 407 N86-22538
Complex systems integrated logistic support: Automatic Test Equipment (ATE) and test oriented languages role --- military aircraft support equipment p 407 N86-22539
Selenia's contribution to the development of systems support: Microwave Automatic Test Equipment (ATE) --- combat aircraft p 407 N86-22540
Implicit activities in the post development phase --- test equipment systems, combat aircraft p 407 N86-22542

Unsteady transonic flow calculations for two-dimensional canard-wing configurations p 410 A86-32780
**CANTILEVER BEAMS**
Composite integral response sensing [AD-A163136] p 470 N86-24457
**CARBON FIBER REINFORCED PLASTICS**
Factors affecting the design of military aircraft structures in carbon fibre reinforced composites p 449 A86-29972
Interactions between flow, heat and mass transfer during formation of carbon-fiber reinforced epoxy composites p 451 N86-22642
Advanced composite structures in commercial transport aircraft [AI/TE3-384/82-ISSUE-2] p 451 N86-22648
**CARBON FIBERS**
Flexural properties of carbon fibre cloth/wood veneer laminates [AD-A161921] p 452 N86-23663
**CARGO AIRCRAFT**
High technology test bed program --- for Hercules cargo aircraft [AIAA PAPER 86-9803] p 431 A86-32132
Tupolev bureau developing TU-204 passenger jet: Tupolev on features p 435 N86-22568

**CARTESIAN COORDINATES**
Numerical generation of 3D curvilinear coordinate systems and computational grids for aircraft configurations
[AD-A162249] p 462 N86-23997

**CASCADE FLOW**
A method for computer aided design of transonic turbine cascade p 409 A86-30734
Application of unsteady wing collocation methods to cascades in subsonic flow p 413 A86-33236
Numerical modeling of transonic flows over airfoils and cascades p 414 A86-33409

**CATHODE RAY TUBES**
160 megapixels per second 2000 line display
p 456 A86-32318

**CAUCHY PROBLEM**
Random-choice-method solutions for two-dimensional planar and axisymmetric steady supersonic flows
[UTIAS-297] p 415 N86-22555

**CAVITATION FLOW**
Supersonic axial-force characteristics of a rectangular-box cavity with various length-to-depth ratios in a flat plate
[NASA-TM-87659] p 415 N86-22554

**CENTER OF GRAVITY**
MEP: A program for cross section magnitudes of a multicell wing profile
[VTH-M-487] p 459 N86-23013

**CENTRIFUGAL COMPRESSORS**
Extended parametric representation of compressor fans and turbines. Volume 1: CMGEN user's manual
[NASA-CR-174645] p 460 N86-23936
Extended parametric representation of compressor fans and turbines. Volume 2: Part user's manual (parametric turbine)
[NASA-CR-174646] p 461 N86-23937
Extended parametric representation of compressor fans and turbines. Volume 3: MODFAN user's manual (parametric modulating flow fan)
[NASA-CR-174647] p 461 N86-23938

**CHARGED PARTICLES**
An integrated development facility for the calibration of low-energy charged particle flight instrumentation
[NASA-TM-86526] p 458 N86-22914

**CHINA**
China report: Science and technology
[JPRS-CST-86-007] p 435 N86-22570

**CHINESE SPACE PROGRAM**
Chinese space and aviation industries score major breakthroughs
[NASA-TM-87973] p 459 N86-23749

**CHINESE SPACECRAFT**
Chinese space and aviation industries score major breakthroughs
[NASA-TM-87973] p 459 N86-23749

**CHOKES**
Mach reflection and aerodynamic choking in two-dimensional ducted flow p 411 A86-32987

**CHROMATES**
The development of dichromated gelatin for holographic optical element applications p 468 A86-32312

**CHROMIUM**
Potential of composite materials to replace chromium, cobalt and manganese in critical applications
[PB86-123965] p 451 N86-22651

**CIRCUIT BREAKERS**
Preliminary hazard analysis for self-contained navigation system
[AD-A161883] p 425 N86-23582

**CIVIL AVIATION**
Trends in the design of airfield radars
p 421 A86-31008
USSR report: Transportation
[JPRS-UTR-86-004] p 435 N86-22565

**CLAMPS**
Aircraft window clamping device
[AD-D011999] p 435 N86-22564

**CLIMBING FLIGHT**
Anatomy of a noise-abatement climb
p 419 A86-31956
Single heading climbs - An alternate technique for determining performance --- in jet transport flight tests
[AIAA PAPER 86-9757] p 429 A86-32098

**CLOUD COVER**
Cloud particle effects on laminar flow in the NASA LEFT program - Preliminary results --- Leading Edge Flight Test
[AIAA PAPER 86-9811] p 432 A86-32138

**CLUTTER**
Efficient, closed-form computation of airborne pulse-Doppler radar clutter p 423 A86-32579
New CFAR-processor based on an ordered statistic
p 457 A86-32618

**COBALT**
Potential of composite materials to replace chromium, cobalt and manganese in critical applications
[PB86-123965] p 451 N86-22651

**COCKPIT SIMULATORS**
Integrating the pilot into the cockpit
[AIAA PAPER 86-9765] p 429 A86-32102

**COCKPITS**
Evaluation of formats for aircraft control/display units
p 438 A86-29864
A peripheral integrated system status display - Figural goodness or proximity effects? p 453 A86-29870
New interfaces in the cockpit p 427 A86-31346
Cockpits for 2010 and beyond p 427 A86-31849
Integrating the pilot into the cockpit
[AIAA PAPER 86-9765] p 429 A86-32102
Thin film electroluminescent (TFEL) display optimized for cockpit applications p 456 A86-32321

**COHERENT RADAR**
F-16 radar data acquisition and analysis
[AIAA PAPER 86-9798] p 422 A86-32127

**COLLISION AVOIDANCE**
The impact of a traffic alert and collision avoidance system on the air traffic control radar beacon system and the mode S system in the Los Angeles Basin
[FAA-PM-84-30] p 425 N86-23581

**COLOR TELEVISION**
Development of a raster/stroke full-color TV projector for simulation p 456 A86-32320

**COMBINED STRESS**
Fatigue crack propagation from an inclined crack under combined mode loading p 450 A86-30013

**COMBUSTION EFFICIENCY**
Minimum time and fuel flight profiles for an F-15 airplane with a Highly Integrated Digital Electronic Control (HIDEC) system
[NASA-TM-86042] p 436 N86-23587

**COMBUSTION STABILITY**
Longitudinal combustion instabilities in ramjet engines Identification of acoustic modes p 440 A86-31586

**COMMERCIAL AIRCRAFT**
Major short-haul role seen for tilt-rotor aircraft
p 420 A86-33427

**COMPASSES**
An apparatus for and a method of determining compass headings
[AD-D012051] p 425 N86-23584

**COMPLEX SYSTEMS**
Interaction between controlling, planning, and fault managing in complex man-machine systems
p 463 A86-33184

**COMPOSITE MATERIALS**
Materials and processes; Proceedings of the Fifth Technology Conference, Montreux, Switzerland, June 12-14, 1984. Volumes 1&2 p 450 A86-31475
China report: Science and technology
[JPRS-CST-86-007] p 435 N86-22570
Potential of composite materials to replace chromium, cobalt and manganese in critical applications
[PB86-123965] p 451 N86-22651
Lightning protection guidelines and test data for adhesively bonded aircraft structures
[NASA-CR-3762] p 436 N86-23586
USAF/SCEEE (United States Air Force/Southeastern Center for Electrical Engineering Education) Research Initiation Program research reports, volume 2
[AD-A161908] p 460 N86-23752

**COMPOSITE STRUCTURES**
Effects of anisotropic design on the static aeroelasticity of a swept wing p 434 A86-33263
The US Army's LHX (light helicopter family) program
[AD-A161949] p 437 N86-23591

**COMPRESSIBLE FLOW**
Outer surface of airplane and computational grid for flow analysis in physical space p 409 A86-31022

**COMPRESSIBLE FLUIDS**
Supersonic interface instabilities of accelerated surfaces and jets p 455 A86-31356

**COMPRESSOR BLADES**
Three-dimensional flow in compressors and channels
[AD-A161858] p 460 N86-23873

**COMPRESSOR EFFICIENCY**
Modelling an axial flow compressor in starting of a turbojet engine p 440 A86-30737

**COMPRESSOR ROTORS**
Extended parametric representation of compressor fans and turbines. Volume 1: CMGEN user's manual
[NASA-CR-174645] p 460 N86-23936
Extended parametric representation of compressor fans and turbines. Volume 2: Part user's manual (parametric turbine)
[NASA-CR-174646] p 461 N86-23937
Extended parametric representation of compressor fans and turbines. Volume 3: MODFAN user's manual (parametric modulating flow fan)
[NASA-CR-174647] p 461 N86-23938

**COMPRESSORS**
Three-dimensional flow in compressors and channels
[AD-A161858] p 460 N86-23873

**COMPUTATIONAL FLUID DYNAMICS**
Calculation of recirculating flow behind flame-holders
p 454 A86-30743
SECTAM XII - Proceedings of the Twelfth Southeastern Conference on Theoretical and Applied Mechanics, Pine Mountain, GA, May 10, 11, 1984. Volume 1
p 455 A86-31258
Solution of the unsteady Euler equations for fixed and rotor wing configurations p 410 A86-32779
Unsteady transonic flow calculations for two-dimensional canard-wing configurations
p 410 A86-32780
Computation of prop-fan engine installation aerodynamics p 410 A86-32781
Euler and Navier-Stokes solutions for flow over a conical delta wing p 411 A86-32960
Comparative study between two Navier-Stokes algorithms for transonic airfoils p 411 A86-32966
Simulation of inviscid vortex-stretched turbulent shear-layer flow p 411 A86-32979
Transonic Equivalent Strip method for aeroelastic applications p 412 A86-33228
Exact closed-form solutions for nonlinear unsteady transonic aerodynamics p 412 A86-33231
Application of unsteady wing collocation methods to cascades in subsonic flow p 413 A86-33236
Numerical modeling of transonic flows over airfoils and cascades p 414 A86-33409
Applications of differential topology to grid generation
[AD-A162634] p 467 N86-24354

**COMPUTATIONAL GRIDS**
Outer surface of airplane and computational grid for flow analysis in physical space p 409 A86-31022
Smoothing patched grids --- in aircraft design
p 464 A86-31312
Calculation of transonic steady and oscillatory pressures on a low aspect ratio model and comparison with experiment p 412 A86-33227
Flow prediction for propfan engine installation effects on transport aircraft at transonic speeds
[NASA-CR-3954] p 414 N86-22550
Numerical analysis of inviscid flows About wing-fuselage combinations. Part 1: Development of grid generation code YOKUDO-G
[NAL-TR-864] p 414 N86-22551
A combined integrating and differentiating matrix formulation for boundary value problems on rectangular domains
[NASA-CR-178074] p 466 N86-23350
A zonal approach to the design of finite element grids for 3-D transonic flows with complex geometries
[AD-A162168] p 417 N86-23572
Coupling linearized far-field boundary conditions with nonlinear near-field solutions in transonic flow
[AD-A162334] p 417 N86-23573
Numerical generation of 3D curvilinear coordinate systems and computational grids for aircraft configurations
[AD-A162249] p 462 N86-23997

**COMPUTER AIDED DESIGN**
A method for computer aided design of transonic turbine cascade p 409 A86-30734
Flight test planning and parameter extraction for rotorcraft system identification
[AIAA PAPER 86-9772] p 430 A86-32107
Airfoil design at sonic velocity p 411 A86-32989
An improvement to the numerical method for calculations of aircraft configuration longitudinal aerodynamic characteristics p 411 A86-32994
Structural optimisation programs and methods --- computer aided aircraft design p 434 A86-33257
Logistics engineering analysis techniques for fault-tolerant avionics systems
[AD-A161961] p 439 N86-23596

**COMPUTER ASSISTED INSTRUCTION**
Development of a computer-managed readiness assessment system
[AD-A162931] p 463 N86-24215
Feasibility study for a static aircraft flight
[AD-A163129] p 466 N86-24233

**COMPUTER DESIGN**
China report: Science and technology
[JPRS-CST-86-004] p 458 N86-22735

**COMPUTER GRAPHICS**
Graphic simulation for air traffic control development
p 421 A86-30358
Computer graphics support of a new era in flight test ground stations
[AIAA PPER 86-9769] p 448 A86-32105
Development of a raster/stroke full-color TV projector for simulation p 456 A86-32320

**COMPUTER PROGRAMMING**

Complex systems integrated logistic support: Automatic Test Equipment (ATE) and test oriented languages role --- military aircraft support equipment p 407 N86-22539

**COMPUTER PROGRAMS**

Calculation of transonic steady and oscillatory pressures on a low aspect ratio model and comparison with experiment p 412 A86-33227

Flutter calculation by a new program p 444 A86-33246

China report: Science and technology [JPRS-CST-86-007] p 435 N86-22570

Programmable hand calculators in aviation sport p 465 N86-23309

An aerodynamic analysis computer program and design notes for low speed wing flap systems [NASA-CR-3675] p 408 N86-23554

Investigation to advance prediction techniques of the low-speed aerodynamics of V/STOL aircraft [NASA-CR-166479] p 416 N86-23568

Proceedings of the 12th Biennial Guidance Test Symposium held at Holloman AFB, New Mexico on 22-24 October 1985, volume 1 [AD-A161996] p 425 N86-23583

Advanced technology helicopter landing gear preliminary design investigation [AD-A162097] p 437 N86-23594

Logistics engineering analysis techniques for fault-tolerant avionics systems [AD-A161961] p 439 N86-23596

Feasibility study for a static aircraft flight [AD-A163129] p 466 N86-24233

Composite integral response sensing [AD-A163136] p 470 N86-24457

An evaluation of CPRA (Cost Performance Report Analysis) estimate at completion techniques based upon AFWAL (Air Force Wright Aeronautical Laboratories) cost/schedule control system criteria data [AD-A162282] p 470 N86-24584

**COMPUTER SYSTEMS DESIGN**

Grumman's real time computing system for avionics testing [AIAA PAPER 86-9732] p 464 A86-32079

Mobile Experimental Laboratory (MEL) --- computer system for real-time acoustic and vibration field tests of aircraft [AIAA PAPER 86-9801] p 465 A86-32130

Telemetry processing system [AIAA PAPER 86-9825] p 465 A86-32148

**COMPUTER SYSTEMS PROGRAMS**

Management controls on the X-29 flight-control system software development [AIAA PAPER 86-9808] p 443 A86-32136

AIAA-86-9827 F-16 radar flight test a lesson in software development [AIAA PAPER 86-9827] p 406 A86-32149

A preliminary design for flight testing the FINDS algorithm [NASA-CR-178043] p 439 N86-22574

MEP: A program for cross section magnitudes of a multicell wing profile [VTH-M-487] p 459 N86-23013

Analysis of data from NASA B-57B gust gradient program [NASA-CR-178736] p 446 N86-23604

**COMPUTER TECHNIQUES**

Multiradar tracking in the new ATC system at Mazatlan (Mexico) area control center p 424 A86-32640

Statue of aircraft engine research at NPU reviewed p 441 N86-22736

**COMPUTERIZED SIMULATION**

1985 Summer Computer Simulation Conference, Chicago, IL, July 22-24, 1985, Proceedings p 464 A86-30351

Graphic simulation for air traffic control development p 421 A86-30358

All about simulators, 1984; Proceedings of the Simulators Conference, Norfolk, VA, April 18-20, 1984 p 464 A86-31252

Comparison of F-101 ejection seat and ACES II static aerodynamic coefficients --- Advanced Concept Ejection Seat p 428 A86-32067

A review of computer simulations for aircraft-surface dynamics p 432 A86-32776

Investigation of the dynamic response of aircraft to microburst (JAWS) wind shear p 445 N86-22578

Coupling linearized far-field boundary conditions with nonlinear near-field solutions in transonic flow [AD-A162334] p 417 N86-23573

Standardized fatigue loading sequences for helicopter rotors (Helix and Felix). Part 1: Background and fatigue evaluation. Part 2: Final definition of Helix and Felix [LBF-FB-167] p 436 N86-23585

**CONFERENCES**

1985 Summer Computer Simulation Conference, Chicago, IL, July 22-24, 1985, Proceedings p 464 A86-30351

All about simulators, 1984; Proceedings of the Simulators Conference, Norfolk, VA, April 18-20, 1984 p 464 A86-31252

International Helicopter Forum, 15th and International Aerospace Exhibition, Hanover, West Germany, May 20-27, 1984, Reports p 407 A86-33300

**CONFIDENCE**

A methodology for airplane parameter estimation and confidence interval determination in nonlinear estimation problems [NASA-RP-1153] p 445 N86-22579

**CONICAL BODIES**

Flow structure at the windward side of conical wings with an attached shock wave at the leading edge p 410 A86-32739

**CONICAL FLOW**

Euler and Navier-Stokes solutions for flow over a conical delta wing p 411 A86-32960

**CONTINUUM MECHANICS**

SECTAM XII - Proceedings of the Twelfth Southeastern Conference on Theoretical and Applied Mechanics, Pine Mountain, GA, May 10, 11, 1984. Volume 1 p 455 A86-31258

**CONTRACT MANAGEMENT**

Depot maintenance of aviation components: Contractor versus organic repair [AD-A162071] p 408 N86-23556

**CONTRAROTATING PROPELLERS**

Low-speed wind-tunnel tests of single- and counter-rotation propellers [NASA-TM-87656] p 415 N86-22552

**CONTROL CONFIGURED VEHICLES**

Development and flight testing of the T-2 control configured vehicle [AIAA PAPER 86-9763] p 429 A86-32101

A discrete adaptive observer for a multi-output aircraft control system p 444 A86-33180

Statistical dynamics and control optimization of flight vehicles --- Russian textbook p 449 A86-33299

**CONTROL STABILITY**

Low-speed stability and control characteristics of a transport model with aft-fuselage-mounted advanced turboprops [NASA-TP-2535] p 445 N86-22580

**CONTROL STICKS**

New interfaces in the cockpit p 427 A86-31346

**CONTROL SURFACES**

Improved numerical method for lifting airfoils with oscillating control surfaces in subsonic flow p 409 A86-31021

**CONTROL SYSTEMS DESIGN**

Conference on Decision and Control, 23rd, Las Vegas, NV, December 12-14, 1984, Proceedings. Volume 3 p 464 A86-31262

Flight investigation of a multivariable model-following control system for rotorcraft [AIAA PAPER 86-9779] p 443 A86-32114

On the development of equiobservable forms with application to adaptive control p 465 A86-33134

Adaptive flight control of unstable helicopters during transition p 444 A86-33178

Interaction between controlling, planning, and fault managing in complex man-machine systems p 463 A86-33184

**CONTROL THEORY**

Conference on Decision and Control, 23rd, Las Vegas, NV, December 12-14, 1984, Proceedings. Volume 3 p 464 A86-31262

Control law synthesis for gust load alleviation using linear quadratic Gaussian theory p 445 A86-33253

**CONTROLLERS**

Recent improvements to the NAE 5 ft. x 5 ft. blowdown wind tunnel [AD-A162034] p 449 N86-23608

**CONVOLUTION INTEGRALS**

Applications of differential topology to grid generation [AD-A162834] p 467 N86-24354

**CORROSION PREVENTION**

Multipurpose corrosion inhibitors for aerospace alloys in naval environments p 450 A86-33021

**COST ANALYSIS**

Helicopter maintenance in the real world p 405 A86-30549

An evaluation of CPRA (Cost Performance Report Analysis) estimate at completion techniques based upon AFWAL (Air Force Wright Aeronautical Laboratories) cost/schedule control system criteria data [AD-A162282] p 470 N86-24584

**COST EFFECTIVENESS**

Comparison of quantity versus quality using performance, reliability, and life cycle cost data. A case study of the F-15, F-16, and A-10 aircraft [AD-A162238] p 470 N86-24580

**COST ESTIMATES**

Impact of Reliability/Maintainability (R/M) on logistics costs for USAF aircraft [AD-A162204] p 470 N86-24579

An evaluation of CPRA (Cost Performance Report Analysis) estimate at completion techniques based upon AFWAL (Air Force Wright Aeronautical Laboratories) cost/schedule control system criteria data [AD-A162282] p 470 N86-24584

**CRACK CLOSURE**

Unified approach for modelling fatigue crack growth and some observations on behaviour under flight simulation loading p 453 A86-29954

Variation of effective stress range ratio under simple variable amplitude loading p 453 A86-30014

**CRACK GEOMETRY**

Short crack development in mechanical structures p 453 A86-30027

**CRACK INITIATION**

Short crack development in mechanical structures p 453 A86-30027

**CRACK PROPAGATION**

Unified approach for modelling fatigue crack growth and some observations on behaviour under flight simulation loading p 453 A86-29954

Spectrum fatigue crack growth behavior of aluminum alloys p 450 A86-30006

Fatigue crack propagation from an inclined crack under combined mode loading p 450 A86-30013

Variation of effective stress range ratio under simple variable amplitude loading p 453 A86-30014

Fatigue of structural materials at high-frequency cycle loading p 453 A86-30019

Fatigue behaviour of advanced aluminium alloy lugs of 7475-T761 with and without initial cracks p 450 A86-30030

Fractographic study of fatigue crack kinetics in bodies and structures p 454 A86-30034

Fatigue crack growth in patched plates under constant amplitude and flight simulation loadings p 454 A86-30092

A stress intensity factor solution due to holes ahead of growing cracks in thin sheet material p 454 A86-31123

Acoustic-backscattering studies of transverse cracks in composite thick laminates p 451 A86-33088

Comparison of aluminum alloys concerning strength and damage tolerance --- aircraft construction materials [MBB-UT-111/85] p 452 N86-23714

**CRACK TIPS**

Unified approach for modelling fatigue crack growth and some observations on behaviour under flight simulation loading p 453 A86-29954

A weak beam transmission electron microscopy study of a fatigue crack tip in a 2024 aluminum alloy p 450 A86-30033

**CRACKING (CHEMICAL ENGINEERING)**

Turbine fuels from tar sands bitumen and heavy oil. Phase 1: Preliminary process analysis [AD-A161300] p 452 N86-22724

**CRACKS**

Short crack problems in gas turbine disks p 440 A86-30093

**CRASH INJURIES**
Survival of helicopter accidents p 419 A86-31005
Evaluation of the crash environment and injury-causing hazards in U.S. Navy helicopters p 419 A86-32070
**CRASH LANDING**
Evaluation of the crash environment and injury-causing hazards in U.S. Navy helicopters p 419 A86-32070
**CRASHWORTHINESS**
Advanced technology helicopter landing gear preliminary design investigation
[AD-A162097] p 437 N86-23594
**CRITERIA**
An evaluation of CPRA (Cost Performance Report Analysis) estimate at completion techniques based upon AFWAL (Air Force Wright Aeronautical Laboratories) cost/schedule control system criteria data
[AD-A162282] p 470 N86-24584
**CRUDE OIL**
Turbine fuels from tar sands, bitumen and heavy oil. Phase 1: Preliminary process analysis
[AD-A161300] p 452 N86-22724
**CRUISING FLIGHT**
Modeling of aircraft cruise performance using acceleration and deceleration maneuvers - Results and application
[AIAA PAPER 86-9735] p 428 A86-32082
**CRYOGENICS**
The National Transonic Facility p 447 A86-31847
**CYCLIC LOADS**
Fatigue of structural materials at high-frequency cycle loading p 453 A86-30019

## D

**DAMAGE**
The application of fracture mechanics methodology to the damage tolerance analysis of the Boeing 757 airplane p 425 A86-30090
Durability and damage-tolerance design and analysis of titanium airframe structures p 454 A86-30091
After action report, CH-47 recovery using D-PAAC
[AD-A161935] p 437 N86-23589
**DAMAGE ASSESSMENT**
Investigation of an aircraft accident by fractographic analysis p 418 A86-30097
**DAMPING**
Investigation of multiple input frequency response function estimation techniques for experimental modal analysis p 461 N86-23971
**DATA ACQUISITION**
The National Transonic Facility p 447 A86-31847
Helicopter data acquisition and processing
[AIAA PAPER 86-9734] p 464 A86-32081
The NDS 2000 Flight Test Instrumentation System in the F-20 Tigershark
[AIAA PAPER 86-9797] p 438 A86-32126
F-16 radar data acquisition and analysis
[AIAA PAPER 86-9798] p 422 A86-32127
**DATA BASES**
Helicopter data acquisition and processing
[AIAA PAPER 86-9734] p 464 A86-32081
Aerodynamic characteristics of a supersonic fighter aircraft model at Mach 0.40 to 2.47
[NASA-TP-2580] p 416 N86-23561
**DATA LINKS**
Expert systems in the fighter of the 1990s
p 405 A86-31848
**DATA PROCESSING**
Helicopter data acquisition and processing
[AIAA PAPER 86-9734] p 464 A86-32081
Telemetry processing system
[AIAA PAPER 86-9825] p 465 A86-32148
**DATA SIMULATION**
Frequency-domain application of Gauss-Newton method to extract aircraft longitudinal parameters
p 442 A86-31125
**DATA SMOOTHING**
Smoothing patched grids --- in aircraft design
p 464 A86-31312
**DATA SYSTEMS**
Principles of flight test
[AIAA PAPER 86-9742] p 406 A86-32087
**DAYTIME**
The relative effect of noise at different times of day: An analysis of existing survey data
[NASA-CR-3965] p 469 N86-24392
**DC 10 AIRCRAFT**
Accident of the DC-10 EC-DEG aircraft at Malaga on September 13, 1982 p 419 A86-31011
**DECISION MAKING**
Depot maintenance of aviation components: Contractor versus organic repair
[AD-A162071] p 408 N86-23556
**DECISION THEORY**
Conference on Decision and Control, 23rd, Las Vegas, NV, December 12-14, 1984, Proceedings. Volume 3
p 464 A86-31262
**DECOUPLING**
Flight test of a decoupler pylon for wing/store flutter suppression
[AIAA PAPER 86-9730] p 428 A86-32077
**DEFORMATION**
The National Transonic Facility p 447 A86-31847
**DEGRADATION**
Analytical determination of propeller performance degradation due to ice accretion
[NASA-CR-175092] p 420 N86-23577
**DEGREES OF FREEDOM**
Improvements to the FATOLA computer program including added actively controlled landing gear subroutines
[NASA-CR-166069] p 436 N86-23568
**DELTA WINGS**
Euler and Navier-Stokes solutions for flow over a conical delta wing p 411 A86-32960
**DESERTS**
Electrostatic charging of the CH-53E helicopter
[AD-A161936] p 437 N86-23590
**DESIGN ANALYSIS**
Logistics supportability considerations during conceptual and preliminary design p 426 A86-30550
Trends in the design of airfield radars
p 421 A86-31008
A general criterion in design --- of aircraft
p 455 A86-31412
An aerodynamic analysis computer program and design notes for low speed wing flap systems
[NASA-CR-3675] p 408 N86-23554
Extended parametric representation of compressor fans and turbines. Volume 1: CMGEN user's manual
[NASA-CR-174645] p 460 N86-23936
Extended parametric representation of compressor fans and turbines. Volume 3: MODFAN user's manual (parametric modulating flow fan)
[NASA-CR-174647] p 461 N86-239
Modifications to the 4x7 meter tunnel for acoustic research: Engineering feasibility study
[NASA-CR-178079] p 470 N86-24394
**DIGITAL COMMAND SYSTEMS**
Robustness of discrete-time dynamical systems: Application to the multivariable digital control of combat aircraft
[ESA-TT-906] p 446 N86-22583
**DIGITAL NAVIGATION**
Extensions to PIFCGT: Multirate output feedback and optimal disturbance suppression
[NASA-CR-3968] p 446 N86-22581
**DIGITAL RADAR SYSTEMS**
Airborne radar - The greater watershed
p 438 A86-31343
Tracking radars at flight test ranges
[AIAA PAPER 86-9747] p 447 A86-32091
Advances in secondary surveillance radar systems
p 423 A86-32581
A radar analysis program for evaluating and monitoring primary and secondary radar systems
p 423 A86-32601
**DIGITAL SYSTEMS**
Extensions to PIFCGT: Multirate output feedback and optimal disturbance suppression
[NASA-CR-3968] p 446 N86-22581
Minimum time and fuel flight profiles for an F-15 airplane with a Highly Integrated Digital Electronic Control (HIDEC) system
[NASA-TM-86042] p 436 N86-23587
**DIGITAL TECHNIQUES**
New interfaces in the cockpit p 427 A86-31346
Dynamic assertion testing of flight control software
[NASA-CR-176716] p 466 N86-23325
**DIMENSIONAL ANALYSIS**
Analysis and verification of the icing scaling equations. Volume 1
[AD-A162226] p 437 N86-23595
**DIRECTIONAL CONTROL**
Directional handling qualities requirements for nap-of-the-earth tasks p 442 A86-30499
**DISPERSIONS**
Dispersion strengthened P/M aluminium alloys
p 451 A86-33223
**DISPLAY DEVICES**
Evaluation of formats for aircraft control/display units
p 438 A86-29864
A peripheral integrated system status display - Figural goodness or proximity effects? p 453 A86-29870
Advanced concepts flight simulation facility
p 446 A86-29916
New interfaces in the cockpit p 427 A86-31346
Advances in display technology V; Proceedings of the Meeting, Los Angeles, CA, January 24, 25, 1985
[SPIE-526] p 456 A86-32314
160 megapixels per second 2000 line display
p 456 A86-32318
Development of a raster/stroke full-color TV projector for simulation p 456 A86-32320
Thin film electroluminescent (TFEL) display optimized for cockpit applications p 456 A86-32321
Feasibility study for a static aircraft flight
[AD-A163129] p 466 N86-24233
**DOCUMENTATION**
Documentation of ice shapes accreted on the main rotor of a UH-1H helicopter in level flight
[NASA-CR-175088] p 420 N86-22559
**DOPPLER NAVIGATION**
Preliminary hazard analysis for self-contained navigation system
[AD-A161883] p 425 N86-23582
**DOPPLER RADAR**
F-16 radar data acquisition and analysis
[AIAA PAPER 86-9798] p 422 A86-32127
AIAA-86-9827 F-16 radar flight test a lesson in software development
[AIAA PAPER 86-9827] p 406 A86-32149
Parameters of a dedicated weather radar for terminal air navigation, traffic control and safety
p 423 A86-32616
Analysis of airborne Doppler lidar, Doppler radar and tall tower measurements of atmospheric flows in quiescent and stormy weather
[NASA-CR-3960] p 462 N86-23159
**DORNIER AIRCRAFT**
New research aircraft for DFVLR p 428 A86-32074
The IA 63 trainer p 429 A86-32075
**DRAG**
Advanced technology helicopter landing gear preliminary design investigation
[AD-A162097] p 437 N86-23594
**DRAG REDUCTION**
Optimum supersonic wings with subsonic leading edges p 410 A86-32785
The passive control of the shock waves on transonic airfoils p 411 A86-32990
**DRAINAGE**
Fuel pump vent drain system
[AD-D011993] p 459 N86-22947
**DRY FRICTION**
Influence of friction dampers on torsional blade flutter
[ASME PAPER 85-GT-170] p 441 A86-32957
**DUCTED FLOW**
Mach reflection and aerodynamic choking in two-dimensional ducted flow p 411 A86-32987
**DURABILITY**
Durability and damage-tolerance design and analysis of titanium airframe structures p 454 A86-30091
**DYNAMIC CHARACTERISTICS**
Free vibration characteristics of periodically stiffened panels with damped stringers p 456 A86-31773
**DYNAMIC LOADS**
Variation of effective stress range ratio under simple variable amplitude loading p 453 A86-30014
**DYNAMIC MODELS**
USAF/SCEEE (United States Air Force/Southeastern Center for Electrical Engineering Education) Research Initiation Program research reports, volume 2
[AD-A161908] p 460 N86-23752
**DYNAMIC RESPONSE**
Investigation of the dynamic response of aircraft to microburst (JAWS) wind shear p 445 N86-22578
Investigation of multiple input frequency response function estimation techniques for experimental modal analysis p 461 N86-23971
**DYNAMIC STABILITY**
Tailoring methodology for aeroelastic stability and lateral control enhancement p 434 A86-33259
Analysis of dynamic stability derivatives for high angle of attack aircraft p 414 N86-22546
**DYNAMIC STRUCTURAL ANALYSIS**
SECTAM XII - Proceedings of the Twelfth Southeastern Conference on Theoretical and Applied Mechanics, Pine Mountain, GA, May 10, 11, 1984. Volume 1
p 455 A86-31258
New and existing techniques for dynamic loads analyses of flexible airplanes p 432 A86-32787
Dynamic characteristics of an assembly of prop-fan blades
[ASME PAPER 85-GT-134] p 441 A86-32956
Step relaxation method for modal test implemented with frequency-domain preprocessing p 457 A86-32975
International Symposium on Aeroelasticity and Structural Dynamics, 2nd, Rheinisch-Westfaelische Technische Hochschule, Aachen, West Germany, April 1-3, 1985, Collected Papers
[DGLR BERICHT 85-02] p 406 A86-33226

Dynamic analysis of structures with flexible rotors
p 441 A86-33256
Structural dynamic aspects of rotor nodal isolation
p 434 A86-33257

**DYNAMIC TESTS**
Biodynamics of personnel parachute landings - A fresh look at parachute descent rates p 419 A86-32068
Dynamic assertion testing of flight control software
[NASA-CR-176715] p 466 N86-23321

**DYNAMICAL SYSTEMS**
Estimation of the state parameters of nonlinear dynamic systems p 465 A86-33047
Robustness of discrete-time dynamical systems: Application to the multivariable digital control of combat aircraft
[ESA-TT-898] p 446 N86-22583

## E

**ECONOMIC FACTORS**
Acoustical design economic tradeoff for transport aircraft --- J p 468 A86-32783

**ECONOMICS**
The economics of the North Atlantic air traffic system
p 419 A86-31324

**EJECTION SEATS**
Comparison of F-101 ejection seat and ACES II static aerodynamic coefficients --- Advanced Concept Ejection Seat p 428 A86-32067

**ELASTIC BODIES**
Calculation of the load distribution, aerodynamic derivatives and dynamic characteristics of quasi-static elastic aircraft p 413 A86-33240

**ELASTIC DEFORMATION**
Calculation of the load distribution, aerodynamic derivatives and dynamic characteristics of quasi-static elastic aircraft p 413 A86-33240

**ELASTIC SHELLS**
A mathematical model for structures consisting of elastic shell sections connected by open girders
p 456 A86-31420

**ELECTRIC CHARGE**
Storm precipitation and wind structure during aircraft strike lightning events
[AD-A162338] p 463 N86-24100

**ELECTRIC IGNITION**
Igniter electrode life control
[AD-D012007] p 441 N86-22577

**ELECTRIC POTENTIAL**
Electrostatic charging of the CH-53E helicopter
[AD-A161936] p 437 N86-23590

**ELECTRIC POWER**
Ceramic thermal barrier coatings for electric utility gas turbine engines
[NASA-TM-87288] p 452 N86-22687

**ELECTRICAL ENGINEERING**
USAF/SCEEE (United States Air Force/Southeastern Center for Electrical Engineering Education) Research Initiation Program research reports, volume 2
[AD-A161908] p 460 N86-23752

**ELECTRICAL INSULATION**
Igniter electrode life control
[AD-D012007] p 441 N86-22577

**ELECTRODES**
Igniter electrode life control
[AD-D012007] p 441 N86-22577

**ELECTROLUMINESCENCE**
Thin film electroluminescent (TFEL) display optimized for cockpit applications p 456 A86-32321

**ELECTROMAGNETIC MEASUREMENT**
Statistical analysis of direct-strike lightning data (1980 to 1982)
[NASA-TP-2252] p 463 N86-24090
The 1982 direct strike lightning data
[NASA-TM-84626] p 463 N86-24091

**ELECTROMAGNETIC SCATTERING**
New symmetrical condensed node for three-dimensional solution of electromagnetic-wave problems by TLM --- transmission-line modeling p 455 A86-31187

**ELECTROMAGNETIC WAVE TRANSMISSION**
New symmetrical condensed node for three-dimensional solution of electromagnetic-wave problems by TLM --- transmission-line modeling p 455 A86-31187

**ELECTRON MICROSCOPY**
A weak beam transmission electron microscopy study of a fatigue crack tip in a 2024 aluminum alloy
p 450 A86-30033

**ELECTRON PARAMAGNETIC RESONANCE**
USAF/SCEEE (United States Air Force/Southeastern Center for Electrical Engineering Education) Research Initiation Program research reports, volume 2
[AD-A161908] p 460 N86-23752

**ELECTRONIC EQUIPMENT TESTS**
Experience with flight testing integrated avionics systems
[AIAA PAPER 86-9804] p 431 A86-32133

**ELECTRONICS**
Aerospace and electronic systems - Advanced concepts and pioneering perspectives; Proceedings of the Sixth Symposium, Dayton, OH, November 14, 15, 1984
p 455 A86-31253

**ELECTROSTATIC CHARGE**
Electrostatic charging of the CH-53E helicopter
[AD-A161936] p 437 N86-23590

**ELEVATORS (CONTROL SURFACES)**
Frequency-domain application of Gauss-Newton method to extract aircraft longitudinal parameters
p 442 A86-31125

**EMERGENCIES**
Development experience with a simple expert system demonstrator for pilot emergency procedures
[NASA-TM-85919] p 446 N86-23603

**ENERGY DISSIPATION**
Energy dissipation of liquids in nutating spherical tanks measured by a forced motion-spin table
[AD-A161864] p 460 N86-23874

**ENERGY LEVELS**
An integrated development facility for the calibration of low-energy charged particle flight instrumentation
[NASA-TM-86526] p 458 N86-22914

**ENERGY POLICY**
Aeroelastic research on wind turbines
[VTH-M-474] p 459 N86-23012
Aeroelastic research on wind turbines
[VTH-M-501] p 459 N86-23014
Aeroelastic research on wind turbines
[VTH-M-517] p 459 N86-23016

**ENGINE DESIGN**
A method for computer aided design of transonic turbine cascade p 409 A86-30734
Calculation of recirculating flow behind flame-holders
p 454 A86-30743
Statue of aircraft engine research at NPU reviewed
p 441 N86-22736

**ENGINE INLETS**
How to not eat your own dust --- particle filters for helicopter air intakes p 440 A86-31328
Experimental analysis of a pitot-type air intake
p 410 A86-32777
Throttle dependent forces: A primer
[AD-A162939] p 442 N86-23599

**ENGINE NOISE**
Battle of the hushkits - All quieter on western front
p 440 A86-31349

**ENGINE PARTS**
Fracture mechanics of multiple crack initiations. An application for fracture mechanics analysis of gas turbine engine disks
[AD-A162998] p 442 N86-23601

**ENGINE STARTERS**
Modelling an axial flow compressor in starting of a turbojet engine p 440 A86-30737

**ENGINE TESTS**
Experimental investigation on frequency response of a turbojet engine to turbulence-type dynamic distortion
p 440 A86-30740
Shanghai's outdoor aeroengine test facility detailed
p 448 N86-22737

**ENVIRONMENT EFFECTS**
Noise of the general aviation airplanes influence on environment of the air club, airfields and on crews
p 461 A86-31955
What should be known on the environmental impact assessment for a planning airport p 462 A86-31962
The relative effect of noise at different times of day: An analysis of existing survey data
[NASA-CR-3965] p 469 N86-24392

**ENVIRONMENTS**
Evaluation of the crash environment and injury-causing hazards in U.S. Navy helicopters p 419 A86-32070

**EPOXY MATRIX COMPOSITES**
Factors affecting the design of military aircraft structures in carbon fibre reinforced composites
p 449 A86-29972
Interactions between flow, heat and mass transfer during formation of carbon-fiber reinforced epoxy composites
p 451 N86-22642

**EPOXY RESINS**
Flexural properties of carbon fibre cloth/wood veneer laminates
[AD-A161921] p 452 N86-23663

**EQUATIONS OF MOTION**
Flutter calculation by a new program
p 444 A86-33246

**EROSION**
Igniter electrode life control
[AD-D012007] p 441 N86-22577

**ERROR ANALYSIS**
Dynamic assertion testing of flight control software
[NASA-CR-176715] p 466 N86-23321
A methodology for testing fault-tolerant software
[NASA-CR-176713] p 466 N86-23323

**ERRORS**
Dynamic assertion testing of flight control software
[NASA-CR-176712] p 466 N86-23322

**EULER EQUATIONS OF MOTION**
Solution of the unsteady Euler equations for fixed and rotor wing configurations p 410 A86-32779
Euler and Navier-Stokes solutions for flow over a conical delta wing p 411 A86-32960
Numerical modeling of transonic flows over airfoils and cascades p 414 A86-33409
Flow prediction for propfan engine installation effects on transport aircraft at transonic speeds
[NASA-CR-3954] p 414 N86-22550

**EUROPEAN AIRBUS**
The 7J7 - Boeing's answer to the Airbus A320
p 426 A86-31039
Coming up - The 330 and 340 p 426 A86-31221

**EVALUATION**
Combined test force operations at the Air Force Flight Test Center
[AIAA PAPER 86-9739] p 406 A86-32085
Operational suitability evaluation of a tactical fighter system
[AIAA PAPER 86-9753] p 406 A86-32094
An evaluation of CPRA (Cost Performance Report Analysis) estimate at completion techniques based upon AFWAL (Air Force Wright Aeronautical Laboratories) cost/schedule control system criteria data
[AD-A162282] p 470 N86-24584

**EXHAUST DIFFUSERS**
Recent improvements to the NAE 5 ft. x 5 ft. blowdown wind tunnel
[AD-A162034] p 449 N86-23608

**EXPERIMENT DESIGN**
Flight test planning and parameter extraction for rotorcraft system identification
[AIAA PAPER 86-9772] p 430 A86-32107

**EXPERT SYSTEMS**
Knowledge-based approach toward developing an autonomous helicopter system p 421 A86-30488
Expert systems in the fighter of the 1990s
p 405 A86-31848
Development experience with a simple expert system demonstrator for pilot emergency procedures
[NASA-TM-85919] p 446 N86-23603

**EXTERNAL STORES**
Flight test of a decoupler pylon for wing/store flutter suppression
[AIAA PAPER 86-9730] p 428 A86-32077
Flight test techniques used for carriage load measurements at large underfuselage store configurations on Tornado combat A/C
[AIAA PAPER 86-9755] p 429 A86-32096
Rapid vibration mode analysis of aircraft with external stores p 435 A86-33281
Optimization of tip store modeling
[AD-A162119] p 417 N86-23571

**EXTREMUM VALUES**
Statistical analysis of direct-strike lightning data (1980 to 1982)
[NASA-TP-2252] p 463 N86-24090

**EYE MOVEMENTS**
USAF/SCEEE (United States Air Force/Southeastern Center for Electrical Engineering Education) Research Initiation Program research reports, volume 2
[AD-A161908] p 460 N86-23752

## F

**F-101 AIRCRAFT**
Comparison of F-101 ejection seat and ACES II static aerodynamic coefficients --- Advanced Concept Ejection Seat p 428 A86-32067

**F-106 AIRCRAFT**
In-flight flow visualization of F-106B leading-edge vortex using the vapor-screen technique
[AIAA PAPER 86-9785] p 431 A86-32118

**F-14 AIRCRAFT**
F-14A low altitude high angle of attack simulation and flight test program
[AIAA PAPER 86-9774] p 430 A86-32109

**F-15 AIRCRAFT**
First use of Ada in flight-critical avionics
[AIAA PAPER 86-9822] p 443 A86-32146

**F-16 AIRCRAFT**
Inflight excitation of the F-16XL
[AIAA PAPER 86-9782] p 430 A86-32116
F-16 radar data acquisition and analysis
[AIAA PAPER 86-9798] p 422 A86-32127

F-16 flutter testing at Eglin Air Force Base
[AIAA PAPER 86-9819] p 439 A86-32144
AIAA-86-9827 F-16 radar flight test a lesson in software development
[AIAA PAPER 86-9827] p 406 A86-32149

**F-18 AIRCRAFT**
Principal site testing concept within the Navy
[AIAA PAPER 86-9740] p 406 A86-32086

**F-20 AIRCRAFT**
The NDS 2000 Flight Test Instrumentation System in the F-20 Tigershark
[AIAA PAPER 86-9797] p 438 A86-32126

**F-4 AIRCRAFT**
Periodic control for minimum-fuel aircraft trajectories
p 427 A86-31657

**FAILURE MODES**
Probabilistic fatigue and fracture design
p 453 A86-29961
Thermal barrier coating life prediction model development
[NASA-CR-175087] p 452 N86-22713

**FAIRINGS**
Natural laminar flow flight experiments on a turbine engine nacelle fairing
[AIAA PAPER 86-9756] p 429 A86-32097

**FAN BLADES**
Dynamic characteristics of an assembly of prop-fan blades
[ASME PAPER 85-GT-134] p 441 A86-32956

**FAR FIELDS**
Coupling linearized far-field boundary conditions with nonlinear near-field solutions in transonic flow
[AD-A162334] p 417 N86-23573

**FATIGUE (MATERIALS)**
Fractographic study of fatigue crack kinetics in bodies and structures p 454 A86-30034
Nonlinear multimode response of clamped rectangular plates to acoustic loading p 457 A86-32973
Standardized fatigue loading sequences for helicopter rotors (Helix and Felix). Part 1: Background and fatigue evaluation. Part 2: Final definition of Helix and Felix
[LBF-FB-167] p 436 N86-23585

**FATIGUE LIFE**
Short crack development in mechanical structures
p 453 A86-30027
Fatigue behaviour of advanced aluminium alloy lugs of 7475-T761 with and without initial cracks
p 450 A86-30030
A study of the effect of certain factors on the fatigue strength of structural irregularities in the airframe of aircraft p 427 A86-31413

**FATIGUE TESTS**
Unified approach for modelling fatigue crack growth and some observations on behaviour under flight simulation loading p 453 A86-29954
Spectrum fatigue crack growth behavior of aluminum alloys p 450 A86-30006
Fatigue crack propagation from an inclined crack under combined mode loading p 450 A86-30013
Fatigue of structural materials at high-frequency cycle loading p 453 A86-30019
A weak beam transmission electron microscopy study of a fatigue crack tip in a 2024 aluminum alloy
p 450 A86-30033
Multipurpose corrosion inhibitors for aerospace alloys in naval environments p 450 A86-33021
Acoustic-backscattering studies of transverse cracks in composite thick laminates p 451 A86-33088

**FAULT TOLERANCE**
Interaction between controlling, planning, and fault managing in complex man-machine systems
p 463 A86-33184
A preliminary design for flight testing the FINDS algorithm
[NASA-CR-178043] p 439 N86-22574
Fuzzy inference system to diagnose aircraft hydraulic faults p 407 N86-22775
Dynamic assertion testing of flight control software
[NASA-CR-176715] p 466 N86-23321
Dynamic assertion testing of flight control software
[NASA-CR-176712] p 466 N86-23322
A methodology for testing fault-tolerant software
[NASA-CR-176713] p 466 N86-23323
Dynamic assertion testing of flight control software
[NASA-CR-176716] p 466 N86-23325
Logistics engineering analysis techniques for fault-tolerant avionics systems
[AD-A161981] p 439 N86-23596
Fault-free validation of a fault-tolerant multiprocessor: Baseline experiments and workoad implementation
[NASA-CR-178075] p 466 N86-24277

**FEASIBILITY ANALYSIS**
Free jet feasibility study of a thermal acoustic shield concept for AST/VCE application-dual flow. Comprehensive data report. Volume 1: Test nozzles and acoustic data
[NASA-CR-174817] p 469 N86-23371
Free-jet feasibility study of a thermal acoustic shield concept for AST/VCE application-dual stream nozzles. Comprehensive data report. Volume 2: Laser velocimeter and suppressor. Base pressure data
[NASA-CR-174818] p 469 N86-23372
Feasibility study for a static aircraft flight
[AD-A163129] p 466 N86-24233

**FEEDBACK CONTROL**
Wind shear estimation by frequency-shaped optimal estimator p 464 A86-31656
Minimax frequency domain optimization of multivariable linear feedback systems p 465 A86-33127
A discrete adaptive observer for a multi-output aircraft control system p 444 A86-33180

**FIBER OPTICS**
Composite integral response sensing
[AD-A163136] p 470 N86-24457

**FIBER REINFORCED COMPOSITES**
Variation of anisotropic behaviour in structural optimization --- for fiber reinforced airframes
p 434 A86-33258

**FIGHTER AIRCRAFT**
How Sweden decided to build the Gripen
p 405 A86-31340
Sweden's Gripen - A tough bird to tangle with
p 427 A86-31341
Su-27 - Sukhoi plays its flanker p 427 A86-31344
Expert systems in the fighter of the 1990s
p 405 A86-31848
Operational suitability evaluation of a tactical fighter system
[AIAA PAPER 86-9753] p 406 A86-32094
Flight test techniques used for carriage load measurements at large underfuselage store configurations on Tornado combat A/C
[AIAA PAPER 86-9755] p 429 A86-32096
Integrating the pilot into the cockpit
[AIAA PAPER 86-9765] p 429 A86-32102
Experimental analysis of a pitot-type air intake
p 410 A86-32777
Aerodynamic parameters estimated from flight and wind tunnel data p 410 A86-32782
Simulation of aircraft taxi testing on the AGILE shaker test facility p 448 A86-33265
Aerodynamic characteristics of a supersonic fighter aircraft model at Mach 0.40 to 2.47
[NASA-TP-2580] p 416 N86-23561
Comparison of quantity versus quality using performance, reliability, and life cycle cost data. A case study of the F-15, F-16, and A-10 aircraft
[AD-A162238] p 470 N86-24580

**FILTERS**
How to not eat your own dust --- particle filters for helicopter air intakes p 440 A86-31328

**FINITE DIFFERENCE THEORY**
Airfoil design at sonic velocity p 411 A86-32989
Calculation of transonic steady and oscillatory pressures on a low aspect ratio model and comparison with experiment p 412 A86-33227
Coupling linearized far-field boundary conditions with nonlinear near-field solutions in transonic flow
[AD-A162334] p 417 N86-23573

**FINITE ELEMENT METHOD**
Finite element modeling of acoustic singularities with application to propeller noise p 468 A86-32778
Experience with aeroelastic analysis of a single engine turbo trainer using finite elements methods
p 433 A86-33247
Shape optimization of axisymmetric structures --- French thesis p 458 A86-33453
A zonal approach to the design of finite element grids for 3-D transonic flows with complex geometries
[AD-A162168] p 417 N86-23572

**FIXED WINGS**
Solution of the unsteady Euler equations for fixed and rotor wing configurations p 410 A86-32779

**FLAME HOLDERS**
Calculation of recirculating flow behind flame-holders
p 454 A86-30743

**FLAT PLATES**
Supersonic axial-force characteristics of a rectangular-box cavity with various length-to-depth ratios in a flat plate
[NASA-TM-87659] p 415 N86-22554

**FLEXIBILITY**
Flexural properties of carbon fibre cloth/wood veneer laminates
[AD-A161921] p 452 N86-23663

**FLEXIBLE BODIES**
New and existing techniques for dynamic loads analyses of flexible airplanes p 432 A86-32787
Dynamic analysis of structures with flexible rotors
p 441 A86-33266

**FLEXIBLE WINGS**
Aerodynamic characteristics of a flexible membrane wing
[AIAA PAPER 84-2168] p 410 A86-32959
Experimental transonic pressure distributions of a flexible wing-aileron model and comparisons with results of several theoretical methods p 432 A86-33239

**FLIGHT CHARACTERISTICS**
Rollout of XT-4 intermediate class training aircraft
p 438 N86-23774

**FLIGHT CONTROL**
Advanced concepts flight simulation facility
p 446 A86-29916
Influence of high-order dynamics on helicoptor flight-control system bandwidth p 442 A86-31660
Real-time open-loop frequency response analysis of flight test data
[AIAA PAPER 86-9738] p 443 A86-32084
Flight test simulation of the T-46
[AIAA PAPER 86-9773] p 430 A86-32108
Flight investigation of a multivariable model-following control system for rotorcraft
[AIAA PAPER 86-9779] p 443 A86-32114
Management controls on the X-29 flight-control system software development
[AIAA PAPER 96-9808] p 443 A86-32136
First use of Ada in flight-critical avionics
[AIAA PAPER 86-9822] p 443 A86-32146
On the development of equiobservable forms with application to adaptive control p 465 A86-33134
Adaptive flight control of unstable helicopters during transition p 444 A86-33178
Extensions to PIFCGT: Multirate output feedback and optimal disturbance suppression
[NASA-CR-3968] p 446 N86-22581
Robustness of discrete-time dynamical systems: Application to the multivariable digital control of combat aircraft
[ESA-TT-906] p 446 N86-22583
Dynamic assertion testing of flight control software
[NASA-CR-176715] p 466 N86-23321
Dynamic assertion testing of flight control software
[NASA-CR-176712] p 466 N86-23322
A methodology for testing fault-tolerant software
[NASA-CR-176713] p 466 N86-23323
Dynamic assertion testing of flight control software
[NASA-CR-176716] p 466 N86-23325
Preliminary hazard analysis for self-contained navigation system
[AD-A161883] p 425 N86-23582
Development experience with a simple expert system demonstrator for pilot emergency procedures
[NASA-TM-85919] p 446 N86-23603

**FLIGHT CREWS**
Airlines and the new technology aircraft - A discussion paper p 419 A86-31325
Noise of the general aviation airplanes influence on environment of the airclub, airfields and on crews
p 461 A86-31955
The US Army's LHX (light helicopter family) program
[AD-A161949] p 437 N86-23591
Development of a computer-managed readiness assessment system
[AD-A162931] p 463 N86-24215

**FLIGHT HAZARDS**
Controlled-Flight-Into-Terrain accidents during unpublished-route radar vectoring p 418 A86-29872
Detection and recognition of hazardous weather conditions by primary surveillance radar
p 457 A86-32614

**FLIGHT INSTRUMENTS**
AFFTIS - What now? --- Air Force Flight Instrumentation System
[AIAA PAPER 86-9799] p 439 A86-32128

**FLIGHT MANAGEMENT SYSTEMS**
Airlines and the new technology aircraft - A discussion paper p 419 A86-31325
Expert systems in the fighter of the 1990s
p 405 A86-31848
Experience with flight testing integrated avionics systems
[AIAA PAPER 86-9804] p 431 A86-32133
Management controls on the X-29 flight-control system software development
[AIAA PAPER 86-9808] p 443 A86-32136

**FLIGHT MECHANICS**
The aeromechanics of aircraft: Flight dynamics (2nd revised and enlarged edition) --- Russian textbook
p 442 A86-30925

FLIGHT OPTIMIZATION

Periodic control for minimum-fuel aircraft trajectories p 427 A86-31657

FLIGHT PATHS

Controlled-Flight-Into-Terrain accidents during unpublished-route radar vectoring p 418 A86-29872

An interpretation of airplane general motion and contol as inverse problem p 443 A86-31661

Flight path measurement of helicopters using a strap-down navigation system [AIAA PAPER 86-9733] p 422 A86-32080

Minimum time and fuel flight profiles for an F-15 airplane with a Highly Integrated Digital Electronic Control (HIDEC) system [NASA-TM-86042] p 436 N86-23587

FLIGHT RECORDERS

Comparative evaluation of redundant flight data recorded by a Digital Airborne Integrated Data System Recorder (DAR) on board an Airbus A-310 aircraft p 439 N86-22575

FLIGHT SAFETY

Biodynamics of personnel parachute landings - A fresh look at parachute descent rates p 419 A86-32068

Chief on unfavorable year for Soviet air traffic control p 424 N86-22566

FLIGHT SIMULATION

Advanced concepts flight simulation facility p 446 A86-29916

Unified approach for modelling fatigue crack growth and some observations on behaviour under flight simulation loading p 453 A86-29954

Fast motion simulation p 454 A86-30359

Modeling of aircraft cruise performance using acceleration and deceleration maneuvers - Results and application [AIAA PAPER 86-9735] p 428 A86-32082

Flight test simulation of the T-46 [AIAA PAPER 86-9773] p 430 A86-32108

F-14A low altitude high angle of attack simulation and flight test program [AIAA PAPER 86-9774] p 430 A86-32109

How to make simulators fly like airplanes [AIAA PAPER 86-9777] p 430 A86-32112

Performance characteristics of transponder-aided versus GPS-aided inertial navigation systems [AIAA PAPER 86-9817] p 422 A86-32142

A new rain/ice test capability to simulate flight [AIAA PAPER 86-9824] p 432 A86-32147

Development of a raster/stroke full-color TV projector for simulation p 456 A86-32320

Turbulence for flight simulation p 462 A86-32788

Minimum time and fuel flight profiles for an F-15 airplane with a Highly Integrated Digital Electronic Control (HIDEC) system [NASA-TM-86042] p 436 N86-23587

FLIGHT SIMULATORS

The development of an advanced helicopter research simulator p 447 A86-29917

Fast motion simulation p 454 A86-30359

How to make simulators fly like airplanes [AIAA PAPER 86-9777] p 430 A86-32112

Feasibility study for a static aircraft flight [AD-A163129] p 466 N86-24233

FLIGHT TEST INSTRUMENTS

The MBB flight test centre and its facilities [AIAA PAPER 86-9746] p 447 A86-32090

Real-time telemetered inertial guidance (TMIG) evaluation [AIAA PAPER 86-9795] p 449 A86-32124

The NDS 2000 Flight Test Instrumentation System in the F-20 Tigershark [AIAA PAPER 86-9797] p 438 A86-32126

FLIGHT TESTS

Flight test of a velocity augmented strapdown navigation system LHN-81 p 421 A86-30314

X-29 flight - Acid test for design predictions p 426 A86-31333

X-29A advanced technology demonstrator program overview [AIAA PAPER 86-9727] p 428 A86-32076

Flight test of a decoupler pylon for wing/store flutter suppression [AIAA PAPER 86-9730] p 428 A86-32077

Instrumentation system for real time navigation system performance assessment [AIAA PAPER 86-9731] p 422 A86-32078

Grumman's real time computing system for avionics testing [AIAA PAPER 86-9732] p 464 A86-32079

Flight path measurement of helicopters using a strap-down navigation system [AIAA PAPER 86-9733] p 422 A86-32080

X-29A flight flutter data analysis by advanced methods [AIAA PAPER 86-9737] p 429 A86-32083

Real-time open-loop frequency response analysis of flight test data [AIAA PAPER 86-9738] p 443 A86-32084

Combined test force operations at the Air Force Flight Test Center [AIAA PAPER 86-9739] p 406 A86-32085

Principal site testing concept within the Navy [AIAA PAPER 86-9740] p 406 A86-32086

Principles of flight test [AIAA PAPER 86-9742] p 406 A86-32087

Long range planning for flight test support [AIAA PAPER 86-9744] p 406 A86-32088

The MBB flight test centre and its facilities [AIAA PAPER 86-9746] p 447 A86-32090

Tracking radars at flight test ranges [AIAA PAPER 86-9747] p 447 A86-32091

Air Force Flight Test Center range overview [AIAA PAPER 86-9748] p 448 A86-32092

Operational suitability evaluation of a tactical fighter system [AIAA PAPER 86-9753] p 406 A86-32094

Flight test techniques used for carriage load measurements at large underfuselage store configurations on Tornado combat A/C [AIAA PAPER 86-9755] p 429 A86-32096

Natural laminar flow flight experiments on a turbine engine nacelle fairing [AIAA PAPER 86-9756] p 429 A86-32097

Single heading climbs - An alternate technique for determining performance --- in jet transport flight tests [AIAA PAPER 86-9757] p 429 A86-32098

Instrumentation of a light twin aircraft for flow energizer flight tests [AIAA PAPER 86-9759] p 438 A86-32099

Development and flight testing of the T-2 control configured vehicle [AIAA PAPER 86-9763] p 429 A86-32101

T-46A flight test results [AIAA PAPER 86-9766] p 429 A86-32103

Computer graphics support of a new era in flight test ground stations [AIAA PPER 86-9769] p 448 A86-32105

Flight test planning and parameter extraction for rotorcraft system identification [AIAA PAPER 86-9772] p 430 A86-32107

Flight test simulation of the T-46 [AIAA PAPER 86-9773] p 430 A86-32108

F-14A low altitude high angle of attack simulation and flight test program [AIAA PAPER 86-9774] p 430 A86-32109

X-29 ground and flight subsystem testing [AIAA PAPER 86-9781] p 430 A86-32115

Inflight excitation of the F-16XL [AIAA PAPER 86-9782] p 430 A86-32116

Constant altitude helicopter flight testing [AIAA PAPER 86-9787] p 431 A86-32119

The NASA modern technology rotors program [AIAA PAPER 86-9788] p 440 A86-32120

Verification of the thrust and airflow model obtained from the performance modelling process [AIAA PAPER 86-9790] p 441 A86-32121

Real-time telemetered inertial guidance (TMIG) evaluation [AIAA PAPER 86-9795] p 449 A86-32124

AFFTIS - What now? --- Air Force Flight Instrumentation System [AIAA PAPER 86-9799] p 439 A86-32128

RASP - A system generating very accurate position markers during flight testing --- RAdiographic Spotting of Position of aircraft [AIAA PAPER 86-9802] p 422 A86-32131

Experience with flight testing integrated avionics systems [AIAA PAPER 86-9804] p 431 A86-32133

Tornado avionic flight testing [AIAA PAPER 86-9805] p 431 A86-32134

Specific excess power applications for rotary wing aircraft [AIAA PAPER 86-9810] p 431 A86-32137

Performance characteristics of transponder-aided versus GPS-aided inertial navigation systems [AIAA PAPER 86-9817] p 422 A86-32142

F-16 flutter testing at Eglin Air Force Base [AIAA PAPER 86-9819] p 439 A86-32144

AIAA-86-9827 F-16 radar flight test a lesson in software development [AIAA PAPER 86-9827] p 406 A86-32149

A radar analysis program for evaluating and monitoring primary and secondary radar systems p 423 A86-32601

The choice of techniques used for flight flutter clearance with particular reference to the BAe 146 and BAe 125 p 433 A86-33245

Improved Y-7, Y-12 aircraft described p 436 N86-22572

Details of Y-121 STOL aircraft presented p 436 N86-22573

A preliminary design for flight testing the FINDS algorithm [NASA-CR-178043] p 439 N86-22574

Comparative evaluation of redundant flight data recorded by a Digital Airborne Integrated Data System Recorder (DAR) on board an Airbus A-310 aircraft p 439 N86-22575

FLIGHT TRAINING

Development of a computer-managed readiness assessment system [AD-A162931] p 463 N86-24215

FLIGHT VEHICLES

Statistical dynamics and control optimization of flight vehicles --- Russian textbook p 449 A86-33299

FLOW COEFFICIENTS

Interactions between flow, heat and mass transfer during formation of carbon-fiber reinforced epoxy composites p 451 N86-22642

FLOW DEFLECTION

Flow structure at the windward side of conical wings with an attached shock wave at the leading edge p 410 A86-32739

FLOW DIRECTION INDICATORS

The 'minituft' surface flow visualisation method - Experience of use in the RAE 5m pressurised low-speed wind tunnel p 447 A86-31124

FLOW DISTRIBUTION

Outer surface of airplane and computational grid for flow analysis in physical space p 409 A86-31022

Supersonic axial-force characteristics of a rectangular-box cavity with various length-to-depth ratios in a flat plate [NASA-TM-87659] p 415 N86-22554

User's guide for NASCRIN: A vectorized code for calculating two-dimensional supersonic internal flow fields [NASA-TM-85708] p 416 N86-23565

A zonal approach to the design of finite element grids for 3-D transonic flows with complex geometries [AD-A162168] p 417 N86-23572

Investigations in the flow field of airfoils with various geometries in the domain of high angles of attack. Experimental investigations [REPT-A-13/85] p 418 N86-23576

Numerical simulation of vortices shed behind a rotating wing p 418 N86-23862

Three-dimensional flow in compressors and channels [AD-A161858] p 460 N86-23873

FLOW EQUATIONS

Steady transonic flow p 413 A86-33408

FLOW GEOMETRY

Flow structure at the windward side of conical wings with an attached shock wave at the leading edge p 410 A86-32739

Impinging jets p 458 A86-33419

FLOW MEASUREMENT

Free-surface flows --- Russian book p 458 A86-33293

FLOW STABILITY

Extended parametric representation of compressor fans and turbines. Volume 1: CMGEN user's manual [NASA-CR-174645] p 460 N86-23936

Extended parametric representation of compressor fans and turbines. Volume 3: MODFAN user's manual (parametric modulating flow fan) [NASA-CR-174647] p 461 N86-23938

FLOW THEORY

An exact formulation of the unsteady aerodynamic theory of lifting surfaces undergoing arbitrary small motions in a supersonic flow field p 413 A86-33235

Aerodynamics and molecular gas dynamics --- Russian book p 414 A86-33480

FLOW VISUALIZATION

The 'minituft' surface flow visualisation method - Experience of use in the RAE 5m pressurised low-speed wind tunnel p 447 A86-31124

In-flight flow visualization of F-106B leading-edge vortex using the vapor-screen technique [AIAA PAPER 86-9785] p 431 A86-32118

Investigation of vortex patterns on slender bodies at high angles of attack p 410 A86-32784

La Recherche Aerospatiale, bimonthly bulletin, number 1985-1, 224/January-February [ESA-TT-915] p 458 N86-22729

FLUID DYNAMICS

Free-surface flows --- Russian book p 458 A86-33293

Activities report of the Department of Aerospace Engineering p 470 N86-23491

FLUID MECHANICS

SECTAM XII - Proceedings of the Twelfth Southeastern Conference on Theoretical and Applied Mechanics, Pine Mountain, GA, May 10, 11, 1984. Volume 1 p 455 A86-31258

SECTAM XII - Proceedings of the Twelfth Southeastern Conference on Theoretical and Applied Mechanics, Pine Mountain, GA, May 10, 11, 1984. Volume 2 p 455 A86-31259

**FLUID ROTOR GYROSCOPES**
Fluidic gyro systems p 438 A86-30312

**FLUTTER**
Flight test of a decoupler pylon for wing/store flutter suppression [AIAA PAPER 86-9730] p 428 A86-32077

**FLUTTER ANALYSIS**
X-29A flight flutter data analysis by advanced methods [AIAA PAPER 86-9737] p 429 A86-32083
F-16 flutter testing at Eglin Air Force Base [AIAA PAPER 86-9819] p 439 A86-32144
Application of transonic unsteady methods for calculation of flutter airloads p 412 A86-33230
The choice of techniques used for flight flutter clearance with particular reference to the BAe 146 and BAe 125 p 433 A86-33245
Flutter calculation by a new program p 444 A86-33246
Development of a flutter suppression control law by use of Linear Quadratic Gaussian and constrained optimization design techniques p 444 A86-33248
NLR experience in the application of active flutter suppression and gust load alleviation, applied to a wind-tunnel model p 444 A86-33250
The design and wind tunnel demonstration of an active control system for gust load alleviation and flutter suppression p 445 A86-33251
Rapid vibration mode analysis of aircraft with external stores p 435 A86-33261

**FLY BY WIRE CONTROL**
Inflight excitation of the F-16XL [AIAA PAPER 86-9782] p 430 A86-32116

**FOCUSING**
An investigation of synthetic aperture radar autofocus [AD-A161912] p 460 N86-23783

**FORMING TECHNIQUES**
Plastic torsion of hollow elements of aircraft --- Russian book p 455 A86-31374

**FOURIER TRANSFORMATION**
Composite integral response sensing [AD-A163136] p 470 N86-24457

**FRACTOGRAPHY**
A weak beam transmission electron microscopy study of a fatigue crack tip in a 2024 aluminum alloy p 450 A86-30033
Fractographic study of fatigue crack kinetics in bodies and structures p 454 A86-30034
Investigation of an aircraft accident by fractographic analysis p 418 A86-30097

**FRACTURE MECHANICS**
The application of fracture mechanics methodology to the damage tolerance analysis of the Boeing 757 airplane p 425 A86-30090
Fracture mechanics of multiple crack initiations. An application for fracture mechanics analysis of gas turbine engine disks [AD-A162998] p 442 N86-23601

**FRACTURE STRENGTH**
Probabilistic fatigue and fracture design p 453 A86-29961

**FREE FLOW**
Free-surface flows --- Russian book p 458 A86-33293

**FREE VIBRATION**
Free vibration characteristics of periodically stiffened panels with damped stringers p 456 A86-31773

**FREQUENCY RESPONSE**
Experimental investigation on frequency response of a turbojet engine to turbulence-type dynamic distortion p 440 A86-30740
Wind shear estimation by frequency-shaped optimal estimator p 464 A86-31656
Real-time open-loop frequency response analysis of flight test data [AIAA PAPER 86-9738] p 443 A86-32084
Effect of radar frequency on the detection of shaped (low RCS) targets p 456 A86-32603
Step relaxation method for modal test implemented with frequency-domain preprocessing p 457 A86-32975

**FRESNEL REGION**
Radio communication between manoeuvring platforms p 456 A86-31921

**FRICTION MEASUREMENT**
Runway rubber removal specification development: Field evaluation results and data analysis [FAA/PM-85/32] p 448 N86-23607

**FUEL CONSUMPTION**
Periodic control for minimum-fuel aircraft trajectories p 427 A86-31657
Scientists on aircraft development trends p 407 N86-22545
Minimum time and fuel flight profiles for an F-15 airplane with a Highly Integrated Digital Electronic Control (HIDEC) system [NASA-TM-86042] p 436 N86-23587

**FUEL FLOW**
Fuel pump vent drain system [AD-D011993] p 459 N86-22947

**FUEL PRODUCTION**
Scientists on aircraft development trends p 407 N86-22545

**FUEL PUMPS**
Fuel pump vent drain system [AD-D011993] p 459 N86-22947

**FUEL SYSTEMS**
Fuel pump vent drain system [AD-D011993] p 459 N86-22947

**FUSELAGES**
Numerical analysis of inviscid flows About wing-fuselage combinations. Part 1: Development of grid generation code YOKUDO-G [NAL-TR-864] p 414 N86-22551
Design of fuselage shapes for natural laminar flow [NASA-CR-3970] p 460 N86-23852

## G

**GAS DYNAMICS**
Aerodynamics and molecular gas dynamics --- Russian book p 414 A86-33480

**GAS FLOW**
Throttle dependent forces: A primer [AD-A162939] p 442 N86-23599

**GAS TURBINE ENGINES**
Aerodynamic and structural detuning of supersonic turbomachine rotors p 440 A86-31595
Details of new Ka-126 helicopter p 435 N86-22569
Ceramic thermal barrier coatings for electric utility gas turbine engines [NASA-TM-87288] p 452 N86-22687

**GAS TURBINES**
Short crack problems in gas turbine disks p 440 A86-30093
Thermal barrier coating life prediction model development [NASA-CR-175087] p 452 N86-22713
Throttle dependent forces: A primer [AD-A162939] p 442 N86-23599
Fracture mechanics of multiple crack initiations. An application for fracture mechanics analysis of gas turbine engine disks [AD-A162998] p 442 N86-23601

**GELATINS**
The development of dichromated gelatin for holographic optical element applications p 468 A86-32312

**GENERAL AVIATION AIRCRAFT**
Air transport pilot involvement in general aviation accidents p 418 A86-29936
Development of spin resistance criteria for light general aviation airplanes [AIAA PAPER 86-9812] p 443 A86-32139
The choice of techniques used for flight flutter clearance with particular reference to the BAe 146 and BAe 125 p 433 A86-33245
Lightning protection guidelines and test data for adhesively bonded aircraft structures [NASA-CR-3762] p 436 N86-23586

**GEOMETRY**
Free jet feasibility study of a thermal acoustic shield concept for AST/VCE application-dual flow. Comprehensive data report. Volume 1: Test nozzles and acoustic data [NASA-CR-174817] p 469 N86-23371
Free-jet feasibility study of a thermal acoustic shield concept for AST/VCE application-dual stream nozzles. Comprehensive data report. Volume 2: Laser velocimeter and suppressor. Base pressure data [NASA-CR-174818] p 469 N86-23372
Geometric and structural properties of a rectangular supercritical wing oscillated in pitch for measurement of unsteady transonic pressure distributions [NASA-TM-85673] p 416 N86-23567

**GIRDERS**
A mathematical model for structures consisting of elastic shell sections connected by open girders p 456 A86-31420

**GLIDE PATHS**
Glide slope indicator system [AD-D012077] p 424 N86-23580

**GLIDERS**
Aeroelastic problems and structural design of a tailless CFC-sailplane p 434 A86-33264

**GLOBAL POSITIONING SYSTEM**
Performance characteristics of transponder-aided versus GPS-aided inertial navigation systems [AIAA PAPER 86-9817] p 422 A86-32142
An apparatus for and a method of determining compass headings [AD-D012051] p 425 N86-23584

**GRAPHITE-EPOXY COMPOSITES**
Acoustic-backscattering studies of transverse cracks in composite thick laminates p 451 A86-33088

**GRAPHS (CHARTS)**
USAF/SCEEE (United States Air Force/Southeastern Center for Electrical Engineering Education) Research Initiation Program research reports, volume 2 [AD-A161908] p 460 N86-23752
Composite integral response sensing [AD-A163136] p 470 N86-24457

**GROUND EFFECT MACHINES**
After action report, CH-47 recovery using D-PAAC [AD-A161935] p 437 N86-23589

**GROUND STATIONS**
Computer graphics support of a new era in flight test ground stations [AIAA PPER 86-9769] p 448 A86-32105

**GROUND SUPPORT EQUIPMENT**
Computer graphics support of a new era in flight test ground stations [AIAA PPER 86-9769] p 448 A86-32105

**GROUND SUPPORT SYSTEMS**
The MBB flight test centre and its facilities [AIAA PAPER 86-9746] p 447 A86-32090

**GROUND TESTS**
Unusual aerodynamics of X-29 p 426 A86-31332
X-29 ground and flight subsystem testing [AIAA PAPER 86-9781] p 430 A86-32115
Integration test facility for P3 aircraft purpose and uses [AIAA PAPER 86-9807] p 448 A86-32135

**GROUND TRUTH**
Analysis of airborne Doppler lidar, Doppler radar and tall tower measurements of atmospheric flows in quiescent and stormy weather [NASA-CR-3960] p 462 N86-23159

**GUIDANCE (MOTION)**
Proceedings of the 12th Biennial Guidance Test Symposium held at Holloman AFB, New Mexico on 22-24 October 1985, volume 1 [AD-A161996] p 425 N86-23583

**GUST ALLEVIATORS**
NLR experience in the application of active flutter suppression and gust load alleviation, applied to a wind-tunnel model p 444 A86-33250
The design and wind tunnel demonstration of an active control system for gust load alleviation and flutter suppression p 445 A86-33251
Windtunnel test and laboratory simulation of a load alleviation system for a modern transport aircraft p 445 A86-33252
Control law synthesis for gust load alleviation using linear quadratic Gaussian theory p 445 A86-33253

**GUST LOADS**
A numerical analysis for vertical gust field induced by gust generator p 432 A86-33237

**GUSTS**
The Australian implementation of AMDAR/ACARS and the use of derived equivalent gust velocity as a turbulence indicator [AR-004-51] p 420 N86-22560
Analysis of data from NASA B-57B gust gradient program [NASA-CR-178736] p 446 N86-23604

**GYROSCOPES**
Proceedings of the 12th Biennial Guidance Test Symposium held at Holloman AFB, New Mexico on 22-24 October 1985, volume 1 [AD-A161996] p 425 N86-23583

**GYROSCOPIC STABILITY**
Fluidic gyro systems p 438 A86-30312

## H

**HAZARDS**
Evaluation of the crash environment and injury-causing hazards in U.S. Navy helicopters p 419 A86-32070
Preliminary hazard analysis for self-contained navigation system [AD-A161883] p 425 N86-23582
Lightning protection guidelines and test data for adhesively bonded aircraft structures [NASA-CR-3762] p 436 N86-23586

**HAZE DETECTION**
Cloud particle effects on laminar flow in the NASA LEFT program - Preliminary results --- Leading Edge Flight Test [AIAA PAPER 86-9811] p 432 A86-32138

**HEAT SHIELDING**

Free jet feasibility study of a thermal acoustic shield concept for AST/VCE application-dual flow. Comprehensive data report. Volume 1: Test nozzles and acoustic data
[NASA-CR-174817] p 469 N86-23371

Free-jet feasibility study of a thermal acoustic shield concept for AST/VCE application-dual stream nozzles. Comprehensive data report. Volume 2: Laser velocimeter and suppressor. Base pressure data
[NASA-CR-174818] p 469 N86-23372

**HEAT TRANSFER**

Interactions between flow, heat and mass transfer during formation of carbon-fiber reinforced epoxy composites
p 451 N86-22642

**HELICOPTER CONTROL**

The development of an advanced helicopter research simulator p 447 A86-29917

Knowledge-based approach toward developing an autonomous helicopter system p 421 A86-30488

Directional handling qualities requirements for nap-of-the-earth tasks p 442 A86-30499

Flight path measurement of helicopters using a strap-down navigation system
[AIAA PAPER 86-9733] p 422 A86-32080

Flight investigation of a multivariable model-following control system for rotorcraft
[AIAA PAPER 86-9779] p 443 A86-32114

Minimax frequency domain optimization of multivariable linear feedback systems p 465 A86-33127

Adaptive flight control of unstable helicopters during transition p 444 A86-33178

**HELICOPTER DESIGN**

Optimal sizing of composite power transmission shafting p 454 A86-30500

Logistics supportability considerations during conceptual and preliminary design p 426 A86-30550

Aerospatiale AS.350 B1 - The mountain squirrel
p 427 A86-31345

The NASA modern technology rotors program
[AIAA PAPER 86-9788] p 440 A86-32120

Structural dynamic aspects of rotor nodal isolation
p 434 A86-33267

International Helicopter Forum, 15th and International Aerospace Exhibition, Hanover, West Germany, May 20-27, 1984, Reports p 407 A86-33300

Advanced technology helicopter landing gear preliminary design investigation
[AD-A162097] p 437 N86-23594

**HELICOPTER ENGINES**

How to not eat your own dust --- particle filters for helicopter air intakes p 440 A86-31328

Phosphorus anti-wear additives in helicopter transmissions
[IC-TS015/85] p 452 N86-22710

**HELICOPTER PERFORMANCE**

Understanding and predicting helicopter behavior - Then and now (Lecture) p 425 A86-30498

Helicopter maintenance in the real world
p 405 A86-30549

Helicopter data acquisition and processing
[AIAA PAPER 86-9734] p 404 A86-32081

Constant altitude helicopter flight testing
[AIAA PAPER 86-9787] p 431 A86-32119

Specific excess power applications for rotary wing aircraft
[AIAA PAPER 86-9810] p 431 A86-32137

Wind tunnel tests of rotor blade sections with replications of ice formations accreted in hover
[NASA-CR-175089] p 420 N86-22558

**HELICOPTERS**

Survival of helicopter accidents p 419 A86-31005

Influence of high-order dynamics on helicopter flight-control system bandwidth p 442 A86-31660

Unsteady aerodynamics in time and frequency domains for finite-time arbitrary motion of helicopter rotor blades in hover and forward flight p 414 N86-22548

Documentation of ice shapes accreted on the main rotor of a UH-1H helicopter in level flight
[NASA-CR-175088] p 420 N86-22559

Details of new Ka-126 helicopter p 435 N86-22569

A combined integrating and differentiating matrix formulation for boundary value problems on rectangular domains
[NASA-CR-178074] p 466 N86-23350

Electrostatic charging of the CH-53E helicopter
[AD-A161936] p 437 N86-23590

The US Army's LHX (light helicopter family) program
[AD-A161949] p 437 N86-23591

**HIGH ALTITUDE**

Aerospatiale AS.350 B1 - The mountain squirrel
p 427 A86-31345

**HIGH LEVEL LANGUAGES**

Rivista Technica Selenia, volume 9, number 3, 1985 --- combat aircraft p 407 N86-22537

Complex systems integrated logistic support: Automatic Test Equipment (ATE) and test oriented languages role --- military aircraft support equipment
p 407 N86-22539

**HIGH REYNOLDS NUMBER**

Comparative study between two Navier-Stokes algorithms for transonic airfoils p 411 A86-32966

**HIGH STRENGTH STEELS**

Probabilistic fatigue and fracture design
p 453 A86-29961

Multipurpose corrosion inhibitors for aerospace alloys in naval environments p 450 A86-33021

**HIGH TEMPERATURE ENVIRONMENTS**

Comparison of measured and calculated temperatures for a Mach 8 hypersonic wing test structure
[NASA-TM-85918] p 435 N86-22563

**HIGH VOLTAGES**

Electrostatic charging of the CH-53E helicopter
[AD-A161936] p 437 N86-23590

**HISTORIES**

The history of instrument flight p 405 A86-29868

Some lessons learned with wind tunnels
[NASA-TM-87710] p 408 N86-23555

**HODOGRAPHS**

Airfoil design at sonic velocity p 411 A86-32989

**HOLE DISTRIBUTION (MECHANICS)**

A stress intensity factor solution due to holes ahead of growing cracks in thin sheet material
p 454 A86-31123

**HOLOGRAPHIC INTERFEROMETRY**

Holography: The nondestructive testing of composite structures --- aerospace structures p 458 N86-22611

**HOLOGRAPHY**

The development of dichromated gelatin for holographic optical element applications p 468 A86-32312

La Recherche Aerospatiale, bimonthly bulletin, number 1985-1, 224/January-February
[ESA-TT-915] p 458 N86-22729

**HOMING DEVICES**

Airborne infrared measurement systems and techniques
[AIAA PAPER 86-9814] p 439 A86-32140

**HOVERING**

Electrostatic charging of the CH-53E helicopter
[AD-A161936] p 437 N86-23590

**HOVERING STABILITY**

Unsteady aerodynamics in time and frequency domains for finite-time arbitrary motion of helicopter rotor blades in hover and forward flight p 414 N86-22548

**HUMAN BEHAVIOR**

Chief on unfavorable year for Soviet air traffic control
p 424 N86-22566

**HUMAN FACTORS ENGINEERING**

Advanced concepts flight simulation facility
p 446 A86-29916

Survival of helicopter accidents p 419 A86-31005

Integrating the pilot into the cockpit
[AIAA PAPER 86-9765] p 429 A86-32102

Chief on unfavorable year for Soviet air traffic control
p 424 N86-22566

**HUMAN REACTIONS**

The relative effect of noise at different times of day: An analysis of existing survey data
[NASA-CR-3965] p 469 N86-24392

**HYDRAULIC EQUIPMENT**

Fuzzy inference system to diagnose aircraft hydraulic faults p 407 N86-22775

**HYDROPLANING**

Runway rubber removal specification development: Field evaluation results and data analysis
[FAA/PM-85/32] p 448 N86-23607

**HYPERSONIC AIRCRAFT**

Aerospace planes and trans-atmospheric vehicles - Recent US studies revive dormant technologies
p 449 A86-31348

**HYPERSONIC BOUNDARY LAYER**

Acta Aerodynamica Sinica (selected articles)
[AD-A162993] p 417 N86-23575

**HYPERSONIC SPEED**

Comparison of measured and calculated temperatures for a Mach 8 hypersonic wing test structure
[NASA-TM-85918] p 435 N86-22563

Nonlinear potential analysis techniques for supersonic-hypersonic aerodynamic design
[NASA-CR-17229P] p 417 N86-23569

**HYPERSONIC VEHICLES**

Transient motion of a hypersonic wedge, including time history effects p 443 A86-31662

**I**

**ICE**

A new rain/ice test capability to simulate flight
[AIAA PAPER 86-9824] p 432 A86-32147

**ICE FORMATION**

Wind tunnel tests of rotor blade sections with replications of ice formations accreted in hover
[NASA-CR-175089] p 420 N86-22558

Documentation of ice shapes accreted on the main rotor of a UH-1H helicopter in level flight
[NASA-CR-175088] p 420 N86-22559

The measurement of aircraft performance and stability and control after flight through natural icing conditions
[NASA-TM-87265] p 446 N86-22582

Analytical determination of propeller performance degradation due to ice accretion
[NASA-CR-175092] p 420 N86-23577

Analysis and verification of the icing scaling equations. Volume 1
[AD-A162226] p 437 N86-23595

**ILYUSHIN AIRCRAFT**

More on new IL-96, IL-114 aircraft
p 435 N86-22567

**IMAGE ANALYSIS**

New class of features for pattern recognition and image analysis p 465 A86-32371

**IMAGE PROCESSING**

New class of features for pattern recognition and image analysis p 465 A86-32371

Glide slope indicator system
[AD-D012077] p 424 N86-23580

**IMPACT**

Impact of Reliability/Maintainability (R/M) on logistics costs for USAF aircraft
[AD-A162204] p 470 N86-24579

**IMPACT LOADS**

Advanced technology helicopter landing gear preliminary design investigation
[AD-A162097] p 437 N86-23594

**IMPACT TESTS**

Bird impact testing at AEDC's range S-3
[AIAA PAPER 86-9818] p 432 A86-32143

**IN-FLIGHT MONITORING**

Flight test of a decoupler pylon for wing/store flutter suppression
[AIAA PAPER 86-9730] p 428 A86-32077

Flight test techniques used for carriage load measurements at large underfuselage store configurations on Tornado combat A/C
[AIAA PAPER 86-9755] p 429 A86-32096

Single heading climbs - An alternate technique for determining performance --- in jet transport flight tests
[AIAA PAPER 86-9757] p 429 A86-32098

In-flight flow visualization of F-106B leading-edge vortex using the vapor-screen technique
[AIAA PAPER 86-9785] p 431 A86-32118

Real-time telemetered inertial guidance (TMIG) evaluation
[AIAA PAPER 86-9795] p 449 A86-32124

**INCOMPRESSIBLE FLOW**

Analytical determination of propeller performance degradation due to ice accretion
[NASA-CR-175092] p 420 N86-23577

**INCOMPRESSIBLE FLUIDS**

Recombination of vortex filaments and its role in aerodynamic noise p 408 A86-30213

**INERTIAL GUIDANCE**

Real-time telemetered inertial guidance (TMIG) evaluation
[AIAA PAPER 86-9795] p 449 A86-32124

Proceedings of the 12th Biennial Guidance Test Symposium held at Holloman AFB, New Mexico on 22-24 October 1985, volume 1
[AD-A161996] p 425 N86-23583

**INERTIAL NAVIGATION**

Flight test of a velocity augmented strapdown navigation system LHN-81 p 421 A86-30314

A laser-inertial airborne surveying system
p 438 A86-30315

Flight path measurement of helicopters using a strap-down navigation system
[AIAA PAPER 86-9733] p 422 A86-32080

Single heading climbs - An alternate technique for determining performance --- in jet transport flight tests
[AIAA PAPER 86-9757] p 429 A86-32098

Performance characteristics of transponder-aided versus GPS-aided inertial navigation systems
[AIAA PAPER 86-9817] p 422 A86-32142

Proceedings of the 12th Biennial Guidance Test Symposium held at Holloman AFB, New Mexico on 22-24 October 1985, volume 1
[AD-A161996] p 425 N86-23583

**INFORMATION DISSEMINATION**

Proceedings of the 12th Biennial Guidance Test Symposium held at Holloman AFB, New Mexico on 22-24 October 1985, volume 1
[AD-A161996] p 425 N86-23583

Information on airport and airway trust fund revenues and outlays by states and large airports
[PB86-129665] p 449 N86-23609

**INFORMATION FLOW**
Proceedings of the 12th Biennial Guidance Test Symposium held at Holloman AFB, New Mexico on 22-24 October 1985, volume 1
[AD-A161996] p 425 N86-23583

**INFRARED INSTRUMENTS**
Airborne infrared measurement systems and techniques
[AIAA PAPER 86-9814] p 439 A86-32140

**INFRARED SIGNATURES**
Airborne infrared measurement systems and techniques
[AIAA PAPER 86-9814] p 439 A86-32140

**INFRARED TRACKING**
Airborne infrared measurement systems and techniques
[AIAA PAPER 86-9814] p 439 A86-32140

**INLET FLOW**
User's guide for NASCRIN: A vectorized code for calculating two-dimensional supersonic internal flow fields
[NASA-TM-85708] p 416 N86-23565

**INPUT**
Investigation of multiple input frequency response function estimation techniques for experimental modal analysis p 461 N86-23971

**INPUT/OUTPUT ROUTINES**
Composite integral response sensing
[AD-A163136] p 470 N86-24457

**INSPECTION**
Limitations of manual NDT systems and the no eyes concept --- nondestructive testing (NDT)
[PNR-90291] p 459 N86-22985

**INSTRUMENT APPROACH**
Restrictions on the dispositions of navigation aids
p 422 A86-31009

**INSTRUMENT FLIGHT RULES**
Controlled-Flight-Into-Terrain accidents during unpublished-route radar vectoring p 418 A86-29872

**INSTRUMENT LANDING SYSTEMS**
Considerations on the influence of positioning on the quality of GP ILS information p 421 A86-31007

**INTEGRATED CIRCUITS**
The US Army's LHX (light helicopter family) program
[AD-A161949] p 437 N86-23591

**INTELLIGIBILITY**
Assessing the intelligibility and acceptability of voice communication systems p 424 A86-32824

**INTERACTIONAL AERODYNAMICS**
Recombination of vortex filaments and its role in aerodynamic noise p 408 A86-30213
Transient motion of a hypersonic wedge, including time history effects p 443 A86-31062

**INVISCID FLOW**
Supersonic interface instabilities of accelerated surfaces and jets p 455 A86-31356
Simulation of inviscid vortex-stretched turbulent shear-layer flow p 411 A86-32979
Numerical analysis of inviscid flows About wing-fuselage combinations. Part 1: Development of grid generation code YOKUDO-G
[NAL-TR-864] p 414 N86-22551
Nonlinear potential analysis techniques for supersonic-hypersonic aerodynamic design
[NASA-CR-172299] p 417 N86-23569
Analytical determination of propeller performance degradation due to ice accretion
[NASA-CR-175092] p 420 N86-23577

**ION DENSITY (CONCENTRATION)**
An integrated development facility for the calibration of low-energy charged particle flight instrumentation
[NASA-TM-86526] p 458 N86-22914

**IONIZATION**
An integrated development facility for the calibration of low-energy charged particle flight instrumentation
[NASA-TM-86526] p 458 N86-22914

## J

**JAMMING**
Raid count by autocorrelation --- performed on radar receiver by reflection from aircraft p 424 A86-32631

**JAPAN**
Japan report: Science and technology
[JPRS-JST-86-007] p 460 N86-23773

**JET AIRCRAFT NOISE**
Battle of the hushkits - All quieter on western front
p 440 A86-31349
Noise emission from jet aircraft during take-off roll with respect to noise exposure calculations
p 467 A86-31957
Free jet feasibility study of a thermal acoustic shield concept for AST/VCE application-dual flow. Comprehensive data report. Volume 1: Test nozzles and acoustic data
[NASA-CR-174817] p 469 N86-23371
Free-jet feasibility study of a thermal acoustic shield concept for AST/VCE application-dual stream nozzles. Comprehensive data report. Volume 2: Laser velocimeter and suppressor. Base pressure data
[NASA-CR-174818] p 469 N86-23372

**JET ENGINES**
Fuel pump vent drain system
[AD-D011993] p 459 N86-22947
Throttle dependent forces: A primer
[AD-A162939] p 442 N86-23599

**JET IMPINGEMENT**
Impinging jets p 458 A86-33419

**JET PROPULSION**
Statue of aircraft engine research at NPU reviewed
p 441 N86-22736

**JET THRUST**
Verification of the thrust and airflow model obtained from the performance modelling process
[AIAA PAPER 86-9790] p 441 A86-32121

**JP-4 JET FUEL**
Turbine fuels from tar sands bitumen and heavy oil. Phase 1: Preliminary process analysis
[AD-A161300] p 452 N86-22724

## K

**KINETIC ENERGY**
USAF/SCEEE (United States Air Force/Southeastern Center for Electrical Engineering Education) Research Initiation Program research reports, volume 2
[AD-A161908] p 460 N86-23752

## L

**LAMINAR FLOW**
Natural laminar flow flight experiments on a turbine engine nacelle fairing
[AIAA PAPER 86-9756] p 429 A86-32097
Cloud particle effects on laminar flow in the NASA LEFT program - Preliminary results --- Leading Edge Flight Test
[AIAA PAPER 86-9811] p 432 A86-32138
Design of fuselage shapes for natural laminar flow
[NASA-CR-3970] p 460 N86-23852

**LAMINATES**
Acoustic-backscattering studies of transverse cracks in composite thick laminates p 451 A86-33088
Flexural properties of carbon fibre cloth/wood veneer laminates
[AD-A161921] p 452 N86-23663
USAF/SCEEE (United States Air Force/Southeastern Center for Electrical Engineering Education) Research Initiation Program research reports, volume 2
[AD-A161908] p 460 N86-23752

**LANDING**
Analysis of data from NASA B-57B gust gradient program
[NASA-CR-178736] p 446 N86-23604

**LANDING AIDS**
Advanced technology helicopter landing gear preliminary design investigation
[AD-A162097] p 437 N86-23594

**LANDING GEAR**
Investigation of main landing gear tire temperatures during taxy-out at heavy take-off masses
[AIAA PAPER 86-9776] p 430 A86-32113
Improvements to the FATOLA computer program including added actively controlled landing gear subroutines
[NASA-CR-166069] p 436 N86-23588
Advanced technology helicopter landing gear preliminary design investigation
[AD-A162097] p 437 N86-23594

**LANDING SPEED**
Biodynamics of personnel parachute landings - A fresh look at parachute descent rates p 419 A86-32068

**LAPLACE TRANSFORMATION**
Flutter calculation by a new program
p 444 A86-33246

**LASER DOPPLER VELOCIMETERS**
A new rain/ice test capability to simulate flight
[AIAA PAPER 86-9824] p 432 A86-32147

**LASER RANGER/TRACKER**
A laser-inertial airborne surveying system
p 438 A86-30315

**LASERS**
China report: Science and technology
[JPRS-CST-86-004] p 458 N86-22735

**LATERAL CONTROL**
Tailoring methodology for aeroelastic stability and lateral control enhancement p 434 A86-33259

**LATERAL OSCILLATION**
Analysis of dynamic stability derivatives for high angle of attack aircraft p 414 N86-22546

**LATERAL STABILITY**
Investigation of vortex patterns on slender bodies at high angles of attack p 410 A86-32784
Locally linearized longitudinal and lateral-directional aerodynamic stability and control derivaties for the X-29A aircraft
[NASA-TM-84919] p 418 N86-23566

**LEADING EDGES**
In-flight flow visualization of F-106B leading-edge vortex using the vapor-screen technique
[AIAA PAPER 86-9785] p 431 A86-32118
Flow structure at the windward side of conical wings with an attached shock wave at the leading edge
p 410 A86-32739
Optimum supersonic wings with subsonic leading edges p 410 A86-32785

**LIFE (DURABILITY)**
Thermal barrier coating life prediction model development
[NASA-CR-175087] p 452 N86-22713
A systems engineering methodology for the advanced tactical aircraft
[AD-A162049] p 437 N86-23593

**LIFE CYCLE COSTS**
Logistics supportability considerations during conceptual and preliminary design p 426 A86-30550
Comparison of quantity versus quality using performance, reliability, and life cycle cost data. A case study of the F-15, F-16, and A-10 aircraft
[AD-A162238] p 470 N86-24580

**LIFE SUPPORT SYSTEMS**
An examination of the life support equipment development and acquisition process
[AD-A162241] p 463 N86-24221

**LIFT**
After action report, CH-47 recovery using D-PAAC
[AD-A161935] p 437 N86-23589

**LIFT AUGMENTATION**
Improved numerical method for lifting airfoils with oscillating control surfaces in subsonic flow
p 409 A86-31021

**LIFT DEVICES**
Instrumentation of a light twin aircraft for flow energizer flight tests
[AIAA PAPER 86-9759] p 433 A86-32099

**LIFTING BODIES**
On the exact solution of the linearized lifting-surface problem of an elliptic wing p 409 A86-31132
An exact formulation of the unsteady aerodynamic theory of lifting surfaces undergoing arbitrary small motions in a supersonic flow field p 413 A86-33235

**LIGHT AIRCRAFT**
Logistics supportability considerations during conceptual and preliminary design p 426 A86-30550
Instrumentation of a light twin aircraft for flow energizer flight tests
[AIAA PAPER 86-9759] p 438 A86-32099
Development of spin resistance criteria for light general aviation airplanes
[AIAA PAPER 86-9812] p 443 A86-32139
Calculation of the load distribution, aerodynamic derivatives and dynamic characteristics of quasi-static elastic aircraft p 413 A86-33240
Experience with aeroelastic analysis of a single engine turbo trainer using finite elements methods
p 433 A86-33247

**LIGHTNING**
Lightning protection guidelines and test data for adhesively bonded aircraft structures
[NASA-CR-3762] p 436 N86-23586
Statistical analysis of direct-strike lightning data (1980 to 1982)
[NASA-TP-2252] p 463 N86-24090
The 1982 direct strike lightning data
[NASA-TM-84626] p 463 N86-24091
Storm precipitation and wind structure during aircraft strike lightning events
[AD-A162338] p 463 N86-24100

**LINE OF SIGHT**
Radio communication between manoeuvring platforms
p 456 A86-31921

**LINEAR PREDICTION**
Real-time open-loop frequency response analysis of flight test data
[AIAA PAPER 86-9738] p 443 A86-32084

**LINEAR SYSTEMS**
Minimax frequency domain optimization of multivariable linear feedback systems p 465 A86-33127

**LIQUID SLOSHING**
Energy dissipation of liquids in nutating spherical tanks measured by a forced motion-spin table [AD-A161864] p 460 N86-23874

**LIQUID SURFACES**
Free-surface flows --- Russian book p 458 A86-33293

**LIQUIDS**
Energy dissipation of liquids in nutating spherical tanks measured by a forced motion-spin table [AD-A161864] p 460 N86-23874

**LITHIUM ALLOYS**
The development of aluminum-lithium alloys for aerospace applications p 451 N86-22616

**LOAD DISTRIBUTION (FORCES)**
Calculation of the load distribution, aerodynamic derivatives and dynamic characteristics of quasi-static elastic aircraft p 413 A86-33240
Optimization of tip store modeling [AD-A162119] p 417 N86-23571

**LOAD TESTS**
Variation of effective stress range ratio under simple variable amplitude loading p 453 A86-30014

**LOADS (FORCES)**
Standardized fatigue loading sequences for helicopter rotors (Helix and Felix). Part 1: Background and fatigue evaluation. Part 2: Final definition of Helix and Felix [LBF-FB-167] p 436 N86-23585
Throttle dependent forces: A primer [AD-A162939] p 442 N86-23599

**LOGISTICS**
Logistics supportability considerations during conceptual and preliminary design p 426 A86-30550
Complex systems integrated logistic support: Automatic Test Equipment (ATE) and test oriented languages role --- military aircraft support equipment p 407 N86-22539
Logistics engineering analysis techniques for fault-tolerant avionics systems [AD-A161981] p 439 N86-23596
Impact of Reliability/Maintainability (R/M) on logistics costs for USAF aircraft [AD-A162204] p 470 N86-24579

**LONGERONS**
Step relaxation method for modal test implemented with frequency-domain preprocessing p 457 A86-32975

**LONGITUDINAL CONTROL**
Frequency-domain application of Gauss-Newton method to extract aircraft longitudinal parameters p 442 A86-31125
A discrete adaptive observer for a multi-output aircraft control system p 444 A86-33180

**LONGITUDINAL STABILITY**
Frequency-domain application of Gauss-Newton method to extract aircraft longitudinal parameters p 442 A86-31125
An improvement to the numerical method for calculations of aircraft configuration longitudinal aerodynamic characteristics p 411 A86-32994
Locally linearized longitudinal and lateral-directional aerodynamic stability and control derivaties for the X-29A aircraft [NASA-TM-84919] p 416 N86-23566

**LOW ALTITUDE**
F-14A low altitude high angle of attack simulation and flight test program [AIAA PAPER 86-9774] p 430 A86-32109
Detectability of low flying targets in real terrain using a diffraction-model p 457 A86-32605

**LOW ASPECT RATIO**
Calculation of transonic steady and oscillatory pressures on a low aspect ratio model and comparison with experiment p 412 A86-33227

**LOW COST**
Impact of Reliability/Maintainability (R/M) on logistics costs for USAF aircraft [AD-A162204] p 470 N86-24579

**LOW SPEED**
An aerodynamic analysis computer program and design notes for low speed wing flap systems [NASA-CR-3675] p 408 N86-23554

**LOW SPEED STABILITY**
Investigation to advance prediction techniques of the low-speed aerodynamics of V/STOL aircraft [NASA-CR-166479] p 416 N86-23568

**LOW SPEED WIND TUNNELS**
The 'minituft' surface flow visualisation method - Experience of use in the RAE 5m pressurised low-speed wind tunnel p 447 A86-31124
Investigation of vortex patterns on slender bodies at high angles of attack p 410 A86-32784
Modifications to the 4x7 meter tunnel for acoustic research: Engineering feasibility study [NASA-CR-178079] p 470 N86-24394

**LUGS**
Fatigue behaviour of advanced aluminium alloy lugs of 7475-T761 with and without initial cracks p 450 A86-30030

**M**

**MACH NUMBER**
Comparison of measured and calculated temperatures for a Mach 8 hypersonic wing test structure [NASA-TM-85918] p 435 N86-22563

**MACH REFLECTION**
Mach reflection and aerodynamic choking in two-dimensional ducted flow p 411 A86-32987

**MAINTAINABILITY**
Impact of Reliability/Maintainability (R/M) on logistics costs for USAF aircraft [AD-A162204] p 470 N86-24579
Comparison of quantity versus quality using performance, reliability, and life cycle cost data. A case study of the F-15, F-16, and A-10 aircraft [AD-A162238] p 470 N86-24580

**MAINTENANCE**
Information on airport and airway trust fund revenues and outlays by states and large airports [PB86-129665] p 449 N86-23609

**MAN MACHINE SYSTEMS**
Cockpits for 2010 and beyond p 427 A86-31849
Integrating the pilot into the cockpit [AIAA PAPER 86-9765] p 429 A86-32102
Interaction between controlling, planning, and fault managing in complex man-machine systems p 463 A86-33184

**MANAGEMENT**
An examination of the life support equipment development and acquisition process [AD-A162241] p 463 N86-24221

**MANAGEMENT INFORMATION SYSTEMS**
Development of a computer-managed readiness assessment system [AD-A162931] p 463 N86-24215

**MANAGEMENT METHODS**
The private enterprise factor in regional airlines p 421 A86-31004

**MANAGEMENT PLANNING**
Long range planning for flight test support [AIAA PAPER 86-9744] p 406 A86-32088

**MANGANESE**
Potential of composite materials to replace chromium, cobalt and manganese in critical applications [PB86-123965] p 451 N86-22651

**MASS TRANSFER**
Interactions between flow, heat and mass transfer during formation of carbon-fiber reinforced epoxy composites p 451 N86-22642

**MATERIALS RECOVERY**
Japan report: Science and technology [JPRS-JST-86-007] p 460 N86-23773

**MATERIALS SCIENCE**
Materials and processes; Proceedings of the Fifth Technology Conference, Montreux, Switzerland, June 12-14, 1984. Volumes 1&2 p 450 A86-31475
Thermophysics of decomposing materials --- Russian book p 451 A86-33323

**MATERIALS TESTS**
Fatigue of structural materials at high-frequency cycle loading p 453 A86-30019

**MATHEMATICAL MODELS**
A mathematical model for structures consisting of elastic shell sections connected by open girders p 456 A86-31420
Verification of the thrust and airflow model obtained from the performance modelling process [AIAA PAPER 86-9790] p 441 A86-32121
A systems engineering methodology for the advanced tactical aircraft [AD-A162049] p 437 N86-23593
Comparison of quantity versus quality using performance, reliability, and life cycle cost data. A case study of the F-15, F-16, and A-10 aircraft [AD-A162238] p 470 N86-24580

**MATRICES (MATHEMATICS)**
A combined integrating and differentiating matrix formulation for boundary value problems on rectangular domains [NASA-CR-178074] p 466 N86-23350

**MEASURING INSTRUMENTS**
An integrated development facility for the calibration of low-energy charged particle flight instrumentation [NASA-TM-86526] p 458 N86-22914

**MECHANICAL DRIVES**
Fuzzy inference system to diagnose aircraft hydraulic faults p 407 N86-22775

**MECHANICAL PROPERTIES**
Dispersion strengthened P/M aluminium alloys p 451 A86-33223

**MECHANICS (PHYSICS)**
SECTAM XII - Proceedings of the Twelfth Southeastern Conference on Theoretical and Applied Mechanics, Pine Mountain, GA, May 10, 11, 1984. Volume 2 p 455 A86-31259

**MEMBRANE STRUCTURES**
Aerodynamic characteristics of a flexible membrane wing [AIAA PAPER 84-2168] p 410 A86-32959

**METAL FATIGUE**
Spectrum fatigue crack growth behavior of aluminum alloys p 450 A86-30006
Fatigue crack propagation from an inclined crack under combined mode loading p 450 A86-30013
Fatigue behaviour of advanced aluminium alloy lugs of 7475-T761 with and without initial cracks p 450 A86-30030
Durability and damage-tolerance design and analysis of titanium airframe structures p 454 A86-30091
Fatigue crack growth in patched plates under constant amplitude and flight simulation loadings p 454 A86-30092

**METAL OXIDES**
Igniter electrode life control [AD-D012007] p 441 N86-22577

**METAL PLATES**
Fatigue crack growth in patched plates under constant amplitude and flight simulation loadings p 454 A86-30092

**METAL POWDER**
Ultrasonic characterization of microstructure in powder metal alloy p 469 N86-22964

**METAL-METAL BONDING**
Lightning protection guidelines and test data for adhesively bonded aircraft structures [NASA-CR-3762] p 436 N86-23586

**METALLOGRAPHY**
Japan report: Science and technology [JPRS-JST-86-007] p 460 N86-23773

**METALS**
Japan report: Science and technology [JPRS-JST-86-007] p 460 N86-23773

**METEOROLOGICAL INSTRUMENTS**
Cloud particle effects on laminar flow in the NASA LEFT program - Preliminary results --- Leading Edge Flight Test [AIAA PAPER 86-9811] p 432 A86-32138
Tomorrow's weather - New accuracy in forecasting p 462 A86-32450

**METEOROLOGICAL RADAR**
Detection and recognition of hazardous weather conditions by primary surveillance radar p 457 A86-32614
Parameters of a dedicated weather radar for terminal air navigation, traffic control and safety p 423 A86-32616

**METEOROLOGY**
The economics of the North Atlantic air traffic system p 419 A86-31324

**MICROCOMPUTERS**
Programmable hand calculators in aviation sport p 465 N86-23309

**MICROPROCESSORS**
An apparatus for and a method of determining compass headings [AD-D012051] p 425 N86-23584

**MICROSTRUCTURE**
Ultrasonic characterization of microstructure in powder metal alloy p 469 N86-22964

**MICROWAVE EQUIPMENT**
Selenia's contribution to the development of systems support: Microwave Automatic Test Equipment (ATE) --- combat aircraft p 407 N86-22540

**MICROWAVE TRANSMISSION**
Considerations on the influence of positioning on the quality of GP ILS information p 421 A86-31007

**MILITARY AIR FACILITIES**
Trends in the design of airfield radars p 421 A86-31008

**MILITARY AIRCRAFT**
Factors affecting the design of military aircraft structures in carbon fibre reinforced composites p 449 A86-29972
Soviet aircraft close technology gap p 427 A86-31336
Noise of military aircraft in the range of airports and at low level flights p 468 A86-31961
Impact of Reliability/Maintainability (R/M) on logistics costs for USAF aircraft [AD-A162204] p 470 N86-24579

**MILITARY HELICOPTERS**
The development of an advanced helicopter research simulator p 447 A86-29917

Evaluation of the crash environment and injury-causing hazards in U.S. Navy helicopters p 4[illegible] A86-32070
The NASA modern technology rotors program [AIAA PAPER 86-9788] p 440 A86-32120
International Helicopter Forum, 15th and International Aerospace Exhibition, Hanover, West Germany, May 20-27, 1984, Reports p 407 A86-33300

**MILITARY OPERATIONS**
Operational acceptability of 2.4 kbps speech for tactical communications p 424 A86-32823

**MILITARY TECHNOLOGY**
Space-based bistatic radar - Opportunity for future tactical air surveillance p 423 A86-32627
A review of aeroelastic research at the flight dynamics laboratory p 433 A86-33242

**MINIMAX TECHNIQUE**
Minimax frequency domain optimization of multivariable linear feedback systems p 465 A86-33127

**MISSILE CONFIGURATIONS**
Effects of some geometric variations on missile aerodynamic characteristics at supersonic speeds [NASA-TM-87683] p 415 N86-22553

**MISSION PLANNING**
Cockpits for 2010 and beyond p 427 A86-31849

**MODAL RESPONSE**
Investigation of multiple input frequency response function estimation techniques for experimental modal analysis p 461 N86-23971

**MODELS**
Extended parametric representation of compressor fans and turbines. Volume 1: CMGEN user's manual [NASA-CR-174645] p 460 N86-23936
Extended parametric representation of compressor fans and turbines. Volume 2: Part user's manual (parametric turbine) [NASA-CR-174646] p 461 N86-23937
Extended parametric representation of compressor fans and turbines. Volume 3: MODFAN user's manual (parametric modulating flow fan) [NASA-CR-174647] p 461 N86-23938

**MOLECULAR GASES**
Aerodynamics and molecular gas dynamics --- Russian book p 414 A86-33480

**MOMENTS**
Analysis of dynamic stability derivatives for high angle of attack aircraft p 414 N86-22546

**MONOPULSE RADAR**
Advances in secondary surveillance radar systems p 423 A86-32581

**MOTION SIMULATION**
Fast motion simulation p 454 A86-30359

**MRCA AIRCRAFT**
Flight test techniques used for carriage load measurements at large underfuselage store configurations on Tornado combat A/C [AIAA PAPER 86-9755] p 429 A86-32096
Tornado avionic flight testing [AIAA PAPER 86-9805] p 431 A86-32134
Rivista Technica Selenia, volume 9, number 3, 1985 --- combat aircraft p 407 N86-22537
The MRCA automatic test system p 407 N86-22538
Complex systems integrated logistic support: Automatic Test Equipment (ATE) and test oriented languages role --- military aircraft support equipment p 407 N86-22539
Selenia's contribution to the development of systems support: Microwave Automatic Test Equipment (ATE) --- combat aircraft p 407 N86-22540
Implicit activities in the post development phase --- test equipment systems, combat aircraft p 407 N86-22542
Lines of evolution --- automatic test equipment, military aircraft p 407 N86-22543

**MULTIPATH TRANSMISSION**
Radio communication between manoeuvring platforms p 456 A86-31921

**MULTIPROCESSING (COMPUTERS)**
Fault-free validation of a fault-tolerant multiprocessor: Baseline experiments and workoad implementation [NASA-CR-178075] p 466 N86-24277

**MULTISENSOR APPLICATIONS**
Expert systems in the fighter of the 1990s p 405 A86-31848

**MULTISTATIC RADAR**
Space-based bistatic radar - Opportunity for future tactical air surveillance p 423 A86-32627

## N

**NACELLES**
Natural laminar flow flight experiments on a turbine engine nacelle fairing [AIAA PAPER 86-9756] p 429 A86-32097

**NAP-OF-THE-EARTH NAVIGATION**
Directional handling qualities requirements for nap-of-the-earth tasks p 442 A86-30499

**NASA PROGRAMS**
The NASA modern technology rotors program [AIAA PAPER 86-9788] p 440 A86-32120

**NATIONAL AIRSPACE SYSTEM**
FAA Air Traffic Control program management technology applications p 424 A86-32925

**NATURAL LANGUAGE (COMPUTERS)**
China report: Science and technology [JPRS-CST-86-007] p 435 N86-22570

**NAVIER-STOKES EQUATION**
Euler and Navier-Stokes solutions for flow over a conical delta wing p 411 A86-32980

**NAVIGATION AIDS**
The history of instrument flight p 405 A86-29868
Aerial navigation p 421 A86-31006
Restrictions on the dispositions of navigation aids p 422 A86-31009

**NAVIGATION INSTRUMENTS**
A laser-inertial airborne surveying system p 438 A86-30315
Instrumentation system for real time navigation system performance assessment [AIAA PAPER 86-9731] p 422 A86-32078

**NEWTON-RAPHSON METHOD**
Frequency-domain application of Gauss-Newton method to extract aircraft longitudinal parameters p 442 A86-31125

**NIGHT**
The relative effect of noise at different times of day: An analysis of existing survey data [NASA-CR-3965] p 469 N86-24392

**NOISE INTENSITY**
Comparison of different aircraft noise exposure indices in flight corridors near airports p 468 A86-31964

**NOISE MEASUREMENT**
Noise of the general aviation airplanes influence on environment of the airclub, airfields and on crews p 461 A86-31955
Aircraft noise - Different ways to monitor the noise load p 467 A86-31959
Characteristics of back-radiated departure noise at San Francisco International Airport p 467 A86-31960

**NOISE POLLUTION**
Aircraft noise - Different ways to monitor the noise load p 467 A86-31959
Characteristics of back-radiated departure noise at San Francisco International Airport p 467 A86-31960
What should be known on the environmental impact assessment for a planning airport p 462 A86-31962
A quiet STOLport? Convincing the public p 462 A86-31963
The relative effect of noise at different times of day: An analysis of existing survey data [NASA-CR-3965] p 469 N86-24392

**NOISE PREDICTION (AIRCRAFT)**
Noise emission from jet aircraft during take-off roll with respect to noise exposure calculations p 467 A86-31957
What should be known on the environmental impact assessment for a planning airport p 462 A86-31962
Finite element modeling of acoustic singularities with application to propeller noise p 468 A86-32778
Prediction of advanced propeller noise in the time domain p 469 A86-32983

**NOISE PROPAGATION**
Noise emission from jet aircraft during take-off roll with respect to noise exposure calculations p 467 A86-31957
Finite element modeling of acoustic singularities with application to propeller noise p 468 A86-32778
Consideration of some factors affecting low-frequency fuselage noise transmission for propeller aircraft [NASA-TP-2552] p 469 N86-24393

**NOISE REDUCTION**
Maneuvers for aircraft noise reduction in takeoff, climb, and landing approach operations p 467 A86-31010
Battle of the hushkits - All quieter on western front p 440 A86-31349
Inter-noise 85; Proceedings of the Fourteenth International Conference on Noise Control Engineering, Munich, West Germany, September 18-20, 1985. Volumes 1 & 2 p 467 A86-31954
Anatomy of a noise-abatement climb p 419 A86-31956
Acoustical design economic tradeoff for transport aircraft --- J p 468 A86-32783
Turbulent boundary-layer wall pressure fluctuations downstream of a tandem LEBU --- Large-Eddy BreakUp devices p 457 A86-32984

**NOISE SPECTRA**
Consideration of some factors affecting low-frequency fuselage noise transmission for propeller aircraft [NASA-TP-2552] p 469 N86-24393

**NONDESTRUCTIVE TESTS**
Holography: The nondestructive testing of composite structures --- aerospace structures p 456 N86-22611
Limitations of manual NDT systems and the no eyes concept --- nondestructive testing (NDT) [PNR-90291] p 459 N86-22985

**NONLINEAR EQUATIONS**
Nonlinear potential analysis techniques for supersonic-hypersonic aerodynamic design [NASA-CR-172299] p 417 N86-23569

**NONLINEAR SYSTEMS**
Stability of a nonlinear stochastic system under periodic excitation --- for helicopter rotor vibration p 444 A86-32657
Estimation of the state parameters of nonlinear dynamic systems p 465 A86-33047
A methodology for airplane parameter estimation and confidence interval determination in nonlinear estimation problems [NASA-RP-1153] p 445 N86-22579
Coupling linearized far-field boundary conditions with nonlinear near-field solutions in transonic flow [AD-A162334] p 417 N86-23573

**NORTHERN HEMISPHERE**
The economics of the North Atlantic air traffic system p 419 A86-31324

**NOZZLE DESIGN**
Free jet feasibility study of a thermal acoustic shield concept for AST/VCE application-dual flow. Comprehensive data report. Volume 1: Test nozzles and acoustic data [NASA-CR-174817] p 469 N86-23371
Free-jet feasibility study of a thermal acoustic shield concept for AST/VCE application-dual stream nozzles. Comprehensive data report. Volume 2: Laser velocimeter and suppressor. Base pressure data [NASA-CR-174818] p 469 N86-23372

**NOZZLE GEOMETRY**
Static investigation of two STOL nozzle concepts with pitch thrust-vectoring capability [NASA-TP-2559] p 415 N86-23559

**NOZZLE THRUST COEFFICIENTS**
Static investigation of two STOL nozzle concepts with pitch thrust-vectoring capability [NASA-TP-2559] p 415 N86-23559

**NUMERICAL ANALYSIS**
Investigation of multiple input frequency response function estimation techniques for experimental modal analysis p 461 N86-23971

**NUMERICAL FLOW VISUALIZATION**
Simulation of inviscid vortex-stretched turbulent shear-layer flow p 411 A86-32979
Numerical modeling of transonic flows over airfoils and cascades p 414 A86-33409
Numerical simulation of vortices shed behind a rotating wing p 418 N86-23862

## O

**OBSERVABILITY (SYSTEMS)**
On the development of equiobservable forms with application to adaptive control p 465 A86-33134
A discrete adaptive observer for a multi-output aircraft control system p 444 A86-33180

**OCEAN SURFACE**
The design, construction and early trials of a novel airborne surveillance radar p 424 A86-32635

**OILS**
Turbine fuels from tar sands bitumen and heavy oil. Phase 1: Preliminary process analysis [AD-A161300] p 452 N86-22724

**ONBOARD DATA PROCESSING**
Wind shear estimation by frequency-shaped optimal estimator p 464 A86-31656
AIAA-86-9827 F-16 radar flight test a lesson in software development [AIAA PAPER 86-9827] p 406 A86-32149

**ONBOARD EQUIPMENT**
After action report, CH-47 recovery using D-PAAC [AD-A161935] p 437 N86-23589

**OPTICAL EQUIPMENT**
The development of dichromated gelatin for holographic optical element applications p 468 A86-32312
Aircraft window clamping device [AD-D011999] p 435 N86-22564

**OPTICAL RADAR**
Analysis of airborne Doppler lidar, Doppler radar and tall tower measurements of atmospheric flows in quiescent and stormy weather [NASA-CR-3960] p 462 N86-23159

**OPTIMAL CONTROL**
Minimax frequency domain optimization of multivariable linear feedback systems p 465 A86-33127

Development of a flutter suppression control law by use of Linear Quadratic Gaussian and constrained optimization design techniques p 444 A86-33248

Extensions to PIFCGT: Multirate output feedback and optimal disturbance suppression [NASA-CR-3968] p 446 N86-22581

Robustness of discrete-time dynamical systems: Application to the multivariable digital control of combat aircraft [ESA-TT-906] p 446 N86-22583

OPTIMIZATION

Thin film electroluminescent (TFEL) display optimized for cockpit applications p 456 A86-32321

Statistical dynamics and control optimization of flight vehicles --- Russian textbook p 449 A86-33299

Shape optimization of axisymmetric structures --- French thesis p 458 A86-33453

A methodology for airplane parameter estimation and confidence interval determination in nonlinear estimation problems [NASA-RP-1153] p 445 N86-22579

Optimization of tip store modeling [AD-A162119] p 417 N86-23571

OSCILLATIONS

Inflight excitation of the F-16XL [AIAA PAPER 86-9782] p 430 A86-32116

Geometric and structural properties of a rectangular supercritical wing oscillated in pitch for measurement of unsteady transonic pressure distributions [NASA-TM-85673] p 416 N86-23567

Coupling linearized far-field boundary conditions with nonlinear near-field solutions in transonic flow [AD-A162334] p 417 N86-23573

P

P-3 AIRCRAFT

Integration test facility for P3 aircraft purpose and uses [AIAA PAPER 86-9807] p 448 A86-32135

PAINTS

New space paints p 451 N86-22621

PANEL FLUTTER

Free vibration characteristics of periodically stiffened panels with damped stringers p 456 A86-31773

PANEL METHOD (FLUID DYNAMICS)

Calculation of 3-d unsteady transonic potential flows by a field panel method p 412 A86-33229

PANELS

Flexural properties of carbon fibre cloth/wood veneer laminates [AD-A161921] p 452 N86-23663

PARACHUTE DESCENT

Biodynamics of personnel parachute landings - A fresh look at parachute descent rates p 419 A86-32068

PARALLEL PROCESSING (COMPUTERS)

A zonal approach to the design of finite element grids for 3-D transonic flows with complex geometries [AD-A162168] p 417 N86-23572

PARAMETER IDENTIFICATION

Frequency-domain application of Gauss-Newton method to extract aircraft longitudinal parameters p 442 A86-31125

Wind shear estimation by frequency-shaped optimal estimator p 464 A86-31656

Flight test planning and parameter extraction for rotorcraft system identification [AIAA PAPER 86-9772] p 430 A86-32107

Estimation of the state parameters of nonlinear dynamic systems p 465 A86-33047

On the development of equiobservable forms with application to adaptive control p 465 A86-33134

A methodology for airplane parameter estimation and confidence interval determination in nonlinear estimation problems [NASA-RP-1153] p 445 N86-22579

PARAMETERIZATION

Extended parametric representation of compressor fans and turbines. Volume 1: CMGEN user's manual [NASA-CR-174645] p 460 N86-23936

Extended parametric representation of compressor fans and turbines. Volume 2: Part user's manual (parametric turbine) [NASA-CR-174646] p 461 N86-23937

Extended parametric representation of compressor fans and turbines. Volume 3: MODFAN user's manual (parametric modulating flow fan) [NASA-CR-174647] p 461 N86-23938

PARTICLE COLLISIONS

A new rain/ice test capability to simulate flight [AIAA PAPER 86-9824] p 432 A86-32147

PARTICLE SIZE DISTRIBUTION

Cloud particle effects on laminar flow in the NASA LEFT program - Preliminary results --- Leading Edge Flight Test [AIAA PAPER 86-9811] p 432 A86-32138

PASSENGER AIRCRAFT

The choice of techniques used for flight flutter clearance with particular reference to the BAe 146 and BAe 125 p 433 A86-33245

Major short-haul role seen for tilt-rotor aircraft p 420 A86-33427

More on new IL-96, IL-114 aircraft p 435 N86-22567

Tupolev bureau developing TU-204 passenger jet: Tupolev on features p 435 N86-22568

PATTERN RECOGNITION

New class of features for pattern recognition and image analysis p 465 A86-32371

PAVEMENTS

Runway rubber removal specification development: Field evaluation results and data analysis [FAA/PM-85/32] p 448 N86-23607

PERFORATED PLATES

A stress intensity factor solution due to holes ahead of growing cracks in thin sheet material p 454 A86-31123

PERFORMANCE PREDICTION

Instrumentation system for real time navigation system performance assessment [AIAA PAPER 86-9731] p 422 A86-32078

Modeling of aircraft cruise performance using acceleration and deceleration maneuvers - Results and application [AIAA PAPER 86-9735] p 428 A86-32082

Verification of the thrust and airflow model obtained from the performance modelling process [AIAA PAPER 86-9790] p 441 A86-32121

Performance analysis of airborne pulse Doppler radar p 423 A86-32578

Nonlinear multimode response of clamped rectangular plates to acoustic loading p 457 A86-32973

PERFORMANCE TESTS

Investigation of main landing gear tire temperatures during taxy-out at heavy take-off masses [AIAA PAPER 86-9778] p 430 A86-32113

Performance characteristics of transponder-aided versus GPS-aided inertial navigation systems [AIAA PAPER 86-9817] p 422 A86-32142

PERSONNEL

Development of a computer-managed readiness assessment system [AD-A162931] p 463 N86-24215

PERSONNEL DEVELOPMENT

Chief on unfavorable year for Soviet air traffic control p 424 N86-22566

PHOSPHONIUM COMPOUNDS

Phosphorus anti-wear additives in helicopter transmissions [IC-TS015/85] p 452 N86-22710

PHYSIOLOGICAL EFFECTS

Noise of the general aviation airplanes influence on environment of the airclub, airfields and on crews p 461 A86-31955

PILOT ERROR

Air transport pilot involvement in general aviation accidents p 418 A86-29936

PILOT TRAINING

Airlines and the new technology aircraft - A discussion paper p 419 A86-31325

PITCH (INCLINATION)

Transient motion of a hypersonic wedge, including time history effects p 443 A86-31662

USAF/SCEEE (United States Air Force/Southeastern Center for Electrical Engineering Education) Research Initiation Program research reports, volume 2 [AD-A161908] p 460 N86-23752

PITOT TUBES

Experimental analysis of a pitot-type air intake p 410 A86-32777

PLAN POSITION INDICATORS

The design, construction and early trials of a novel airborne surveillance radar p 424 A86-32635

PLANE WAVES

Consideration of some factors affecting low-frequency fuselage noise transmission for propeller aircraft [NASA-TP-2552] p 469 N86-24393

PLASTIC AIRCRAFT STRUCTURES

Acoustic-backscattering studies of transverse cracks in composite thick laminates p 451 A86-33088

Variation of anisotropic behaviour in structural optimization --- for fiber reinforced airframes p 434 A86-33258

PLASTIC DEFORMATION

Plastic torsion of hollow elements of aircraft --- Russian book p 455 A86-31374

PLATE THEORY

Calculation of structural elements of aircraft: Sandwich plates and shells --- Russian book p 458 A86-33292

POLARIZED ELECTROMAGNETIC RADIATION

Considerations on the influence of positioning on the quality of GP ILS information p 421 A86-31007

POLLUTION MONITORING

Aircraft noise - Different ways to monitor the noise load p 467 A86-31959

New research aircraft for DFVLR p 428 A86-32074

POLYMERIZATION

Interactions between flow, heat and mass transfer during formation of carbon-fiber reinforced epoxy composites p 451 N86-22642

POROSITY

Ultrasonic characterization of microstructure in powder metal alloy p 469 N86-22964

POROUS BOUNDARY LAYER CONTROL

The passive control of the shock waves on transonic airfoils p 411 A86-32990

PORTABLE EQUIPMENT

Mobile Experimental Laboratory (MEL) --- computer system for real-time acoustic and vibration field tests of aircraft [AIAA PAPER 86-9801] p 465 A86-32130

POSITION (LOCATION)

Considerations on the influence of positioning on the quality of GP ILS information p 421 A86-31007

Restrictions on the dispositions of navigation aids p 422 A86-31009

POSITION INDICATORS

RASP - A system generating very accurate position markers during flight testing --- RAdiographic Spotting of Position of aircraft [AIAA PAPER 86-9802] p 422 A86-32131

POTENTIAL GRADIENTS

An improved potential gradient method for the calculation of unsteady aerodynamic pressures on oscillating wings in supersonic flow p 413 A86-33234

POTENTIAL THEORY

Nonlinear potential analysis techniques for supersonic-hypersonic aerodynamic design [NASA-CR-172299] p 417 N86-23569

POWDER METALLURGY

Dispersion strengthened P/M aluminium alloys p 451 A86-33223

Ultrasonic characterization of microstructure in powder metal alloy p 469 N86-22964

PREAMPLIFIERS

An apparatus for and a method of determining compass headings [AD-D012051] p 425 N86-23584

PREDICTION ANALYSIS TECHNIQUES

Investigation to advance prediction techniques of the low-speed aerodynamics of V/STOL aircraft [NASA-CR-166479] p 416 N86-23568

Validation of USAF stability and control Datcom methodologies for straight-tapered sweptforward wings [AD-A161876] p 417 N86-23570

Fracture mechanics of multiple crack initiations. An application for fracture mechanics analysis of gas turbine engine disks [AD-A162998] p 442 N86-23601

PREDICTIONS

The impact of a traffic alert and collision avoidance system on the air traffic control radar beacon system and the mode S system in the Los Angeles Basin [FAA-PM-84-30] p 425 N86-23581

PRESSURE DISTRIBUTION

Recent transonic unsteady pressure measurements at the NASA Langley Research Center Center p 412 A86-33232

Steady and unsteady pressure distributions on various profiles in separated subsonic and transonic flow p 413 A86-33233

An improved potential gradient method for the calculation of unsteady aerodynamic pressures on oscillating wings in supersonic flow p 413 A86-33234

An exact formulation of the unsteady aerodynamic theory of lifting surfaces undergoing arbitrary small motions in a supersonic flow field p 413 A86-33235

Application of unsteady wing collocation methods to cascades in subsonic flow p 413 A86-33236

Experimental transonic pressure distributions of a flexible wing-aileron model and comparisons with results of several theoretical methods p 432 A86-33239

PRESSURE MEASUREMENT

The National Transonic Facility p 447 A86-31847

Recent transonic unsteady pressure measurements at the NASA Langley Research Center Center p 412 A86-33232

PRESSURE SENSORS

Recent improvements to the NAE 5 ft. x 5 ft. blowdown wind tunnel [AD-A162034] p 449 N86-23608

**PROBABILITY THEORY**
Probabilistic fatigue and fracture design p 453 A86-29961

**PROCUREMENT MANAGEMENT**
Information on airport and airway trust fund revenues and outlays by states and large airports [PB86-129665] p 449 N86-23609
An examination of the life support equipment development and acquisition process [AD-A162241] p 463 N86-24221

**PROCUREMENT POLICY**
An examination of the life support equipment development and acquisition process [AD-A162241] p 463 N86-24221

**PRODUCT DEVELOPMENT**
Rivista Technica Selenia, volume 9, number 3, 1985 --- combat aircraft p 407 N86-22537
Implicit activities in the post development phase --- test equipment systems, combat aircraft p 407 N86-22542
Lines of evolution --- automatic test equipment, military aircraft p 407 N86-22543
Statue of aircraft engine research at NPU reviewed p 441 N86-22736
Rollout of XT-4 intermediate class training aircraft p 438 N86-23774

**PROJECT MANAGEMENT**
X-29A advanced technology demonstrator program overview [AIAA PAPER 86-9727] p 428 A86-32076
FAA Air Traffic Control program management technology applications p 424 A86-32925

**PROJECTORS**
Development of a raster/stroke full-color TV projector for simulation p 456 A86-32320

**PROP-FAN TECHNOLOGY**
What technologies await the future airliner? p 405 A86-31038
Computation of prop-fan engine installation aerodynamics p 410 A86-32781
Dynamic characteristics of an assembly of prop-fan blades [ASME PAPER 85-GT-134] p 441 A86-32956

**PROPELLER BLADES**
Dynamic characteristics of an assembly of prop-fan blades [ASME PAPER 85-GT-134] p 441 A86-32956
Prediction of advanced propeller noise in the time domain p 469 A86-32963
Low-speed wind-tunnel tests of single- and counter-rotation propellers [NASA-TM-87656] p 415 N86-22552

**PROPELLER DRIVE**
Finite element modeling of acoustic singularities with application to propeller noise p 468 A86-32778

**PROPELLER FANS**
Computation of prop-fan engine installation aerodynamics p 410 A86-32781

**PROPELLERS**
La Recherche Aerospatiale, bimonthly bulletin, number 1985-1, 224/January-February [ESA-TT-915] p 458 N86-22729
Analytical determination of propeller performance degradation due to ice accretion [NASA-CR-175092] p 420 N86-23577

**PROPULSION**
Activities report of the Department of Aerospace Engineering p 470 N86-23491

**PROPULSIVE EFFICIENCY**
Computation of prop-fan engine installation aerodynamics p 410 A86-32781

**PROTOTYPES**
The IA 63 trainer p 428 A86-32075

**PUBLIC RELATIONS**
A quiet STOLport? Convincing the public p 462 A86-31963

**PULSE DOPPLER RADAR**
Airborne radar - The greater watershed p 438 A86-31343
Performance analysis of airborne pulse Doppler radar p 423 A86-32578
Efficient, closed-form computation of airborne pulse-Doppler radar clutter p 423 A86-32579

**PYLONS**
Flight test of a decoupler pylon for wing/store flutter suppression [AIAA PAPER 86-9730] p 428 A86-32077

## Q

**QUALITATIVE ANALYSIS**
An examination of the life support equipment development and acquisition process [AD-A162241] p 463 N86-24221

**QUALITY**
Comparison of quantity versus quality using performance, reliability, and life cycle cost data. A case study of the F-15, F-16, and A-10 aircraft [AD-A162238] p 470 N86-24580

**QUALITY CONTROL**
Limitations of manual NDT systems and the no eyes concept --- nondestructive testing (NDT) [PNR-90291] p 459 N86-22995

**QUANTILES**
Statistical analysis of direct-strike lightning data (1980 to 1982) [NASA-TP-2252] p 463 N86-24090

## R

**RADAR**
Trends in the design of airfield radars p 421 A86-31008

**RADAR ANTENNAS**
F-16 radar data acquisition and analysis [AIAA PAPER 86-9798] p 422 A86-32127
Raid count by autocorrelation --- performed on radar receiver by reflection from aircraft p 424 A86-32631

**RADAR CROSS SECTIONS**
Radar cross section testing [AIAA PAPER 86-9828] p 448 A86-32150
A radar analysis program for evaluating and monitoring primary and secondary radar systems p 423 A86-32601
Effect of radar frequency on the detection of shaped (low RCS) targets p 456 A86-32603

**RADAR DETECTION**
Effect of radar frequency on the detection of shaped (low RCS) targets p 456 A86-32603
Detectability of low flying targets in real terrain using a diffraction model p 457 A86-32605
Detection and recognition of hazardous weather conditions by primary surveillance radar p 457 A86-32614
New CFAR-processor based on an ordered statistic p 457 A86-32618
Raid count by autocorrelation --- performed on radar receiver by reflection from aircraft p 424 A86-32631

**RADAR EQUIPMENT**
Airborne radar - The greater watershed p 438 A86-31343
Tracking radars at flight test ranges [AIAA PAPER 86-9747] p 447 A86-32091
The design, construction and early trials of a novel airborne surveillance radar p 424 A86-32635

**RADAR MEASUREMENT**
A radar analysis program for evaluating and monitoring primary and secondary radar systems p 423 A86-32601

**RADAR NAVIGATION**
Preliminary hazard analysis for self-contained navigation system [AD-A161883] p 425 N86-23582

**RADAR RECEIVERS**
Raid count by autocorrelation --- performed on radar receiver by reflection from aircraft p 424 A86-32631

**RADAR TARGET SCATTER SITE PROGRAM**
Radar cross section testing [AIAA PAPER 86-9828] p 448 A86-32150

**RADAR TARGETS**
A radar analysis program for evaluating and monitoring primary and secondary radar systems p 423 A86-32601
New CFAR-processor based on an ordered statistic p 457 A86-32618

**RADAR TRACKING**
Space based radar application to air traffic control p 423 A86-32626
Multiradar tracking in the new ATC system at Mazatlan (Mexico) area control center p 424 A86-32640

**RADIO COMMUNICATION**
Radio communication between manoeuvring platforms p 456 A86-31921

**RADIO EQUIPMENT**
Preliminary hazard analysis for self-contained navigation system [AD-A161883] p 425 N86-23582

**RADIOGRAPHY**
RASP - A system generating very accurate position markers during flight testing --- RAdiographic Spotting of Position of aircraft [AIAA PAPER 86-9802] p 422 A86-32131

**RAIL TRANSPORTATION**
USSR report: Transportation [JPRS-UTR-86-004] p 435 N86-22565

**RAIN**
Effects of intense rainfall on the aerodynamics of an airfoil profile p 409 A86-31013
A new rain/ice test capability to simulate flight [AIAA PAPER 86-9824] p 432 A86-32147

**RAMJET ENGINES**
Longitudinal combustion instabilities in ramjet engines Identification of acoustic modes p 440 A86-31586

**READING**
USAF/SCEEE (United States Air Force/Southeastern Center for Electrical Engineering Education) Research Initiation Program research reports, volume 2 [AD-A161906] p 460 N86-23752

**REAL TIME OPERATION**
Expert systems in the fighter of the 1990s p 405 A86-31848
Grumman's real time computing system for avionics testing [AIAA PAPER 86-9732] p 464 A86-32079
Helicopter data acquisition and processing [AIAA PAPER 86-9734] p 464 A86-32081
Real-time open-loop frequency response analysis of flight test data [AIAA PAPER 86-9738] p 443 A86-32084
Real-time telemetered inertial guidance (TMIG) evaluation [AIAA PAPER 86-9795] p 449 A86-32124
Mobile Experimental Laboratory (MEL) --- computer system for real-time acoustic and vibration field tests of aircraft [AIAA PAPER 86-9801] p 465 A86-32130
A methodology for testing fault-tolerant software [NASA-CR-176713] p 466 N86-23323
Fault-free validation of a fault-tolerant multiprocessor: Baseline experiments and workoad implementation [NASA-CR-178075] p 466 N86-24277

**RECIRCULATIVE FLUID FLOW**
Calculation of recirculating flow behind flame-holders p 454 A86-30743

**RECOVERY VEHICLES**
After action report, CH-47 recovery using D-PAAC [AD-A161935] p 437 N86-23589

**RECTANGULAR PANELS**
Nonlinear multimode response of clamped rectangular plates to acoustic loading p 457 A86-32973

**RECTANGULAR WINGS**
Steady and unsteady pressure distributions on various profiles in separated subsonic and transonic flow p 413 A86-33233

**REFERENCE SYSTEMS**
Instrumentation system for real time navigation system performance assessment [AIAA PAPER 86-9731] p 422 A86-32078

**REFINING**
Turbine fuels from tar sands bitumen and heavy oil. Phase 1: Preliminary process analysis [AD-A161300] p 452 N86-22724

**REGRESSION ANALYSIS**
An evaluation of CPRA (Cost Performance Report Analysis) estimate at completion techniques based upon AFWAL (Air Force Wright Aeronautical Laboratories) cost/schedule control system criteria data [AD-A162282] p 470 N86-24584

**REINFORCED PLATES**
Fatigue crack growth in patched plates under constant amplitude and flight simulation loadings p 454 A86-30092
A study of an iteration method for the analysis of plates with parallel stiffness ribs as systems of superelements p 455 A86-31417

**REINFORCEMENT RINGS**
Aircraft window clamping device [AD-D011999] p 435 N86-22564

**RELAXATION METHOD (MATHEMATICS)**
Step relaxation method for modal test implemented with frequency-domain preprocessing p 457 A86-32975

**RELIABILITY**
Impact of Reliability/Maintainability (R/M) on logistics costs for USAF aircraft [AD-A162204] p 470 N86-24579
Comparison of quantity versus quality using performance, reliability, and life cycle cost data. A case study of the F-15, F-16, and A-10 aircraft [AD-A162238] p 470 N86-24580

**RELIABILITY ANALYSIS**
Short crack problems in gas turbine disks p 440 A86-30093

**RELIABILITY ENGINEERING**
Logistics engineering analysis techniques for fault-tolerant avionics systems [AD-A161981] p 439 N86-23596

**REMOTE SENSING**
The design, construction and early trials of a novel airborne surveillance radar p 424 A86-32635
Analysis of airborne Doppler lidar, Doppler radar and tall tower measurements of atmospheric flows in quiescent and stormy weather [NASA-CR-3960] p 462 N86-23159

**RESCUE OPERATIONS**
After action report, CH-47 recovery using D-PAAC [AD-A161935] p 437 N86-23589

**RESEARCH AIRCRAFT**
X-aircraft for world leadership in aeronautics p 405 A86-31330
X-29 revives the experimental aircraft p 426 A86-31331
Unusual aerodynamics of X-29 p 426 A86-31332
X-29 aims at applications p 426 A86-31334
New research aircraft for DFVLR p 428 A86-32074
X-29A flight flutter data analysis by advanced methods [AIAA PAPER 86-9737] p 429 A86-32083
High technology test bed program --- for Hercules cargo aircraft [AIAA PAPER 86-9803] p 431 A86-32132

**RESEARCH AND DEVELOPMENT**
X-aircraft for world leadership in aeronautics p 405 A86-31330
The development of dichromated gelatin for holographic optical element applications p 468 A86-32312
A review of aeroelastic research at the flight dynamics laboratory p 433 A86-33242
Some lessons learned with wind tunnels [NASA-TM-87710] p 408 N86-23555

**RESEARCH FACILITIES**
Shanghai's outdoor aeroengine test facility detailed p 448 N86-22737

**RESEARCH MANAGEMENT**
An evaluation of CPRA (Cost Performance Report Analysis) estimate at completion techniques based upon AFWAL (Air Force Wright Aeronautical Laboratories) cost/schedule control system criteria data [AD-A162282] p 470 N86-24584

**RESIDUAL STRENGTH**
Comparison of aluminum alloys concerning strength and damage tolerance --- aircraft construction materials [MBB-UT-111/85] p 452 N86-23714

**RESONANT VIBRATION**
Structural dynamic aspects of rotor nodal isolation p 434 A86-33267
Determination of natural vibration properties of a wing with winglet by experimental mode synthesis technique p 435 A86-33280

**RESOURCE ALLOCATION**
USAF/SCEEE (United States Air Force/Southeastern Center for Electrical Engineering Education) Research Initiation Program research reports, volume 2 [AD-A161908] p 460 N86-23752

**REVENUE**
Information on airport and airway trust fund revenues and outlays by states and large airports [PB86-129665] p 449 N86-23609

**RIBS (SUPPORTS)**
A study of an iteration method for the analysis of plates with parallel stiffness ribs as systems of superelements p 455 A86-31417

**RING LASERS**
Proceedings of the 12th Biennial Guidance Test Symposium held at Holloman AFB, New Mexico on 22-24 October 1985, volume 1 [AD-A161996] p 425 N86-23583

**ROBUSTNESS (MATHEMATICS)**
Robustness of discrete-time dynamical systems: Application to the multivariable digital control of combat aircraft [ESA-TT-906] p 446 N86-22583

**ROCKET VEHICLES**
Aircraft and rockets: Design concepts --- Romanian book p 410 A86-32324

**ROLL**
Analysis of dynamic stability derivatives for high angle of attack aircraft p 414 N86-22546

**ROTARY WING AIRCRAFT**
Flight investigation of a multivariable model-following control system for rotorcraft [AIAA PAPER 86-9779] p 443 A86-32114
Specific excess power applications for rotary wing aircraft [AIAA PAPER 86-9810] p 431 A86-32137
The US Army's LHX (light helicopter family) program [AD-A161949] p 437 N86-23591

**ROTARY WINGS**
The NASA modern technology rotors program [AIAA PAPER 86-9788] p 440 A86-32120
Stability of a nonlinear stochastic system under periodic excitation --- for helicopter rotor vibration p 444 A86-32657
Solution of the unsteady Euler equations for fixed and rotor wing configurations p 410 A86-32779
A new look at arbitrary motion unsteady aerodynamics and its application to rotary-wing aeroelasticity p 413 A86-33238
Structural dynamic aspects of rotor nodal isolation p 434 A86-33267
Unsteady aerodynamics in time and frequency domains for finite-time arbitrary motion of helicopter rotor blades in hover and forward flight p 414 N86-22548
Documentation of ice shapes accreted on the main rotor of a UH-1H helicopter in level flight [NASA-CR-175088] p 420 N86-22559
Standardized fatigue loading sequences for helicopter rotors (Helix and Felix). Part 1: Background and fatigue evaluation. Part 2: Final definition of Helix and Felix [LBF-FB-167] p 436 N86-23585

**ROTATION**
Numerical simulation of vortices shed behind a rotating wing p 418 N86-23862

**ROTOR AERODYNAMICS**
Aerodynamic and structural detuning of supersonic turbomachine rotors p 440 A86-31595
Influence of high-order dynamics on helicopter flight-control system bandwidth p 442 A86-31660

**ROTOR BLADES (TURBOMACHINERY)**
Influence of friction dampers on torsional blade flutter [ASME PAPER 85-GT-170] p 441 A86-32957
Wind tunnel tests of rotor blade sections with replications of ice formations accreted in hover [NASA-CR-175089] p 420 N86-22558
MEP: A program for cross section magnitudes of a multicell wing profile [VTH-M-487] p 459 N86-23013
A combined integrating and differentiating matrix formulation for boundary value problems on rectangular domains [NASA-CR-178074] p 466 N86-23350

**ROTOR BODY INTERACTIONS**
Structural dynamic aspects of rotor nodal isolation p 434 A86-33267

**ROTOR SYSTEMS RESEARCH AIRCRAFT**
Flight test planning and parameter extraction for rotorcraft system identification [AIAA PAPER 86-9772] p 430 A86-32107

**ROTORS**
Dynamic analysis of structures with flexible rotors p 441 A86-33266

**RUBBER**
Runway rubber removal specification development: Field evaluation results and data analysis [FAA/PM-85/32] p 448 N86-23607

**RUNWAY CONDITIONS**
The extension of the Madeira airport runway - A unique task p 447 A86-31012
A review of computer simulations for aircraft-surface dynamics p 432 A86-32776
Simulation of aircraft taxi testing on the AGILE shaker test facility p 448 A86-33265
Runway rubber removal specification development: Field evaluation results and data analysis [FAA/PM-85/32] p 448 N86-23607

**RUNWAY LIGHTS**
Glide slope indicator system [AD-D012077] p 424 N86-23580

## S

**SABOTAGE**
Investigation of an aircraft accident by fractographic analysis p 418 A86-30097

**SAFETY MANAGEMENT**
Information on airport and airway trust fund revenues and outlays by states and large airports [PB86-129665] p 449 N86-23609

**SANDWICH STRUCTUHES**
Calculation of structural elements of aircraft: Sandwich plates and shells --- Russian book p 458 A86-33292

**SCALING LAWS**
Analysis and verification of the icing scaling equations. Volume 1 [AD-A162226] p 437 N86-23595

**SECONDARY RADAR**
Advances in secondary surveillance radar systems p 423 A86-32581
A radar analysis program for evaluating and monitoring primary and secondary radar systems p 423 A86-32601

**SEPARATED FLOW**
Dynamic stall inception correlation for airfoils undergoing constant pitch rate motions p 411 A86-32978
Steady and unsteady pressure distributions on various profiles in separated subsonic and transonic flow p 413 A86-33233
Acta Aerodynamica Sinica (selected articles) [AD-A162993] p 417 N86-23575
Investigations in the flow field of airfoils with various geometries in the domain of high angles of attack. Experimental investigations [REPT-A-13/85] p 418 N86-23576

**SEPARATORS**
How to not eat your own dust --- particle filters for helicopter air intakes p 440 A86-31328

**SERVICE LIFE**
Igniter electrode life control [AD-D012007] p 441 N86-22577
Fracture mechanics of multiple crack initiations. An application for fracture mechanics analysis of gas turbine engine disks [AD-A162998] p 442 N86-23601

**SHAFTS (MACHINE ELEMENTS)**
Optimal sizing of composite power transmission shafting p 454 A86-30500

**SHAPES**
Shape optimization of axisymmetric structures --- French thesis p 458 A86-33453
Documentation of ice shapes accreted on the main rotor of a UH-1H helicopter in level flight [NASA-CR-175088] p 420 N86-22559

**SHEAR LAYERS**
Simulation of inviscid vortex-stretched turbulent shear-layer flow p 411 A86-32979

**SHELL THEORY**
Calculation of structural elements of aircraft: Sandwich plates and shells --- Russian book p 458 A86-33292

**SHELLS (STRUCTURAL FORMS)**
Plastic torsion of hollow elements of aircraft --- Russian book p 455 A86-31374

**SHIPS**
USSR report: Transportation [JPRS-UTR-86-004] p 435 N86-22565

**SHIPYARDS**
USSR report: Transportation [JPRS-UTR-86-004] p 435 N86-22565

**SHOCK WAVE ATTENUATION**
The passive control of the shock waves on transonic airfoils p 411 A86-32990

**SHOCK WAVE PROPAGATION**
Flow structure at the windward side of conical wings with an attached shock wave at the leading edge p 410 A86-32739

**SHOCK WAVES**
Supersonic interface instabilities of accelerated surfaces and jets p 455 A86-31356

**SHORT CIRCUITS**
Electrostatic charging of the CH-53E helicopter [AD-A161936] p 437 N86-23590

**SHORT TAKEOFF AIRCRAFT**
A quiet STOLport? Convincing the public p 462 A86-31963
Details of Y-121 STOL aircraft presented p 436 N86-22573
Static investigation of two STOL nozzle concepts with pitch thrust-vectoring capability [NASA-TP-2559] p 415 N86-23559

**SIDE-LOOKING RADAR**
The design, construction and early trials of a novel airborne surveillance radar p 424 A86-32635

**SIGNAL PROCESSING**
The NDS 2000 Flight Test Instrumentation System in the F-20 Tigershark [AIAA PAPER 86-9797] p 438 A86-32126

**SIMILARITY THEOREM**
Aeroelastic wind tunnel similarity theory for anisotropic aircraft wings p 433 A86-33244

**SIMULATORS**
All about simulators, 1984; Proceedings of the Simulators Conference, Norfolk, VA, April 18-20, 1984 p 464 A86-31252

**SITE SELECTION**
Combined test force operations at the Air Force Flight Test Center [AIAA PAPER 86-9739] p 406 A86-32085
Principal site testing concept within the Navy [AIAA PAPER 86-9740] p 406 A86-32086

**SLENDER BODIES**
Investigation of vortex patterns on slender bodies at high angles of attack p 410 A86-32784

**SOFTWARE ENGINEERING**
Dynamic assertion testing of flight control software [NASA-CR-176716] p 466 N86-23325

**SOFTWARE TOOLS**
Management controls on the X-29 flight-control system software development [AIAA PAPER 86-9808] p 443 A86-32136
Dynamic assertion testing of flight control software [NASA-CR-176715] p 466 N86-23321
Dynamic assertion testing of flight control software [NASA-CR-176712] p 466 N86-23322
A methodology for testing fault-tolerant software [NASA-CR-176713] p 466 N86-23323

**SOUND FIELDS**
Finite element modeling of acoustic singularities with application to propeller noise p 468 A86-32778

**SOUND WAVES**
Consideration of some factors affecting low-frequency fuselage noise transmission for propeller aircraft
[NASA-TP-2552] p 469 N86-24393
**SPACE BASED RADAR**
Space based radar application to air traffic control
p 423 A86-32626
Space-based bistatic radar - Opportunity for future tactical air surveillance p 423 A86-32627
**SPACECRAFT CONSTRUCTION MATERIALS**
The development of aluminum-lithium alloys for aerospace applications p 451 N86-22616
**SPACECRAFT DESIGN**
Aerospace planes and trans-atmospheric vehicles - Recent US studies revive dormant technologies
p 449 A86-31348
Activities report of the Department of Aerospace Engineering p 470 N86-23491
**SPACECRAFT STRUCTURES**
Holography: The nondestructive testing of composite structures --- aerospace structures p 458 N86-22611
New space paints p 451 N86-22621
**SPECTRUM ANALYSIS**
Helicopter data acquisition and processing
[AIAA PAPER 86-9734] p 464 A86-32081
**SPEECH**
Operational acceptability of 2.4 kbps speech for tactical communications p 424 A86-32823
**SPHERICAL COORDINATES**
Numerical generation of 3D curvilinear coordinate systems and computational grids for aircraft configurations
[AD-A162249] p 462 N86-23997
**SPHERICAL TANKS**
Energy dissipation of liquids in nutating spherical tanks measured by a forced motion-spin table
[AD-A161864] p 460 N86-23874
**STABILITY**
Validation of USAF stability and control Datcom methodologies for straight-tapered sweptforward wings
[AD-A161876] p 417 N86-23570
**STABILITY DERIVATIVES**
Validation of USAF stability and control Datcom methodologies for straight-tapered sweptforward wings
[AD-A161876] p 417 N86-23570
**STANDARDIZATION**
Progress towards international standardisation of aircraft noise contour calculations p 468 A86-31966
**STATE ESTIMATION**
Estimation of the state parameters of nonlinear dynamic systems p 465 A86-33047
**STATE VECTORS**
New and existing techniques for dynamic loads analyses of flexible airplanes p 432 A86-32787
**STATIC AERODYNAMIC CHARACTERISTICS**
Comparison of F-101 ejection seat and ACES II static aerodynamic coefficients --- Advanced Concept Ejection Seat p 428 A86-32067
· Static aeroelastic analysis using aircraft vibration modes p 432 A86-33241
**STATIC DISCHARGERS**
Electrostatic charging of the CH-53E helicopter
[AD-A161936] p 437 N86-23590
**STATIC TESTS**
Static investigation of two STOL nozzle concepts with pitch thrust-vectoring capability
[NASA-TP-2559] p 415 N86-23559
**STATISTICAL ANALYSIS**
Statistical dynamics and control optimization of flight vehicles --- Russian textbook p 449 A86-33299
Analysis of data from NASA B-57B gust gradient program
[NASA-CR-178736] p 446 N86-23604
Statistical analysis of direct-strike lightning data (1980 to 1982)
[NASA-TP-2252] p 463 N86-24090
**STEADY FLOW**
On the exact solution of the linearized lifting-surface problem of an elliptic wing p 409 A86-31132
Steady transonic flow p 413 A86-33408
**STIFFENING**
A study of an iteration method for the analysis of plates with parallel stiffness ribs as systems of superelements
p 455 A86-31417
**STOCHASTIC PROCESSES**
Stability of a nonlinear stochastic system under periodic excitation --- for helicopter rotor vibration
p 444 A86-32657
**STORMS**
Storm precipitation and wind structure during aircraft strike lightning events
[AD-A162338] p 463 N86-24100
**STRAIN GAGES**
Composite integral response sensing
[AD-A163136] p 470 N86-24457
**STRAPDOWN INERTIAL GUIDANCE**
Flight test of a velocity augmented strapdown navigation system LHN-81 p 421 A86-30314
Flight path measurement of helicopters using a strap-down navigation system
[AIAA PAPER 86-9733] p 422 A86-32080
**STRATEGIC MATERIALS**
Potential of composite materials to replace chromium, cobalt and manganese in critical applications
[PB86-123965] p 451 N86-22651
**STRESS ANALYSIS**
Calculation of structural elements of aircraft: Sandwich plates and shells --- Russian book p 458 A86-33292
La Recherche Aerospatiale, bimonthly bulletin, number 1985-1, 224/January-February
[ESA-TT-915] p 458 N86-22729
**STRESS CORROSION CRACKING**
Multipurpose corrosion inhibitors for aerospace alloys in naval environments p 450 A86-33021
**STRESS INTENSITY FACTORS**
Unified approach for modelling fatigue crack growth and some observations on behaviour under flight simulation loading p 453 A86-29954
A stress intensity factor solution due to holes ahead of growing cracks in thin sheet material
p 454 A86-31123
**STRESS-STRAIN RELATIONSHIPS**
A study of an iteration method for the analysis of plates with parallel stiffness ribs as systems of superelements
p 455 A86-31417
A mathematical model for structures consisting of elastic shell sections connected by open girders
p 456 A86-31420
**STRINGERS**
Free vibration characteristics of periodically stiffened panels with damped stringers p 456 A86-31773
**STRUCTURAL ANALYSIS**
SECTAM XII - Proceedings of the Twelfth Southeastern Conference on Theoretical and Applied Mechanics, Pine Mountain, GA, May 10, 11, 1984. Volume 1
p 455 A86-31258
SECTAM XII - Proceedings of the Twelfth Southeastern Conference on Theoretical and Applied Mechanics, Pine Mountain, GA, May 10, 11, 1984. Volume 2
p 455 A86-31259
Geometric and structural properties of a rectangular supercritical wing oscillated in pitch for measurement of unsteady transonic pressure distributions
[NASA-TM-85673] p 416 N86-23567
**STRUCTURAL DESIGN**
Probabilistic fatigue and fracture design
p 453 A86-29961
A study of an iteration method for the analysis of plates with parallel stiffness ribs as systems of superelements
p 455 A86-31417
The application of practical optimization techniques in the preliminary structural design of a forward-swept wing
p 433 A86-33256
Structural optimisation programs and methods --- computer aided aircraft design p 434 A86-33257
Variation of anisotropic behaviour in structural optimization --- for fiber reinforced airframes
p 434 A86-33258
Shape optimization of axisymmetric structures --- French thesis p 458 A86-33453
**STRUCTURAL DESIGN CRITERIA**
Factors affecting the design of military aircraft structures in carbon fibre reinforced composites
p 449 A86-29972
A general criterion in design --- of aircraft
p 455 A86-31412
A study of the effect of certain factors on the fatigue strength of structural irregularities in the airframe of aircraft p 427 A86-31413
Effects of anisotropic design on the static aeroelasticity of a swept wing p 434 A86-33263
Aeroelastic problems and structural design of a tailless CFC-sailplane p 434 A86-33264
Advanced composite structures in commercial transport aircraft
[AI/TE3-384/82-ISSUE-2] p 451 N86-22648
**STRUCTURAL FAILURE**
Nonlinear multimode response of clamped rectangular plates to acoustic loading p 457 A86-32973
**STRUCTURAL MEMBERS**
Calculation of structural elements of aircraft: Sandwich plates and shells --- Russian book p 458 A86-33292
·Logistics engineering analysis techniques for fault-tolerant avionics systems
[AD-A161981] p 439 N86-23596
**STRUCTURAL RELIABILITY**
Short crack development in mechanical structures
p 453 A86-30027
Short crack problems in gas turbine disks
p 440 A86-30093
A study of the effect of certain factors on the fatigue strength of structural irregularities in the airframe of aircraft p 427 A86-31413
**STRUCTURAL VIBRATION**
Inflight excitation of the F-16XL
[AIAA PAPER 86-9782] p 430 A86-32116
Comparison of some time domain methods for structural system identification p 457 A86-33279
Rapid vibration mode analysis of aircraft with external stores p 435 A86-33281
**SUBSONIC FLOW**
Improved numerical method for lifting airfoils with oscillating control surfaces in subsonic flow
p 409 A86-31021
Application of unsteady wing collocation methods to cascades in subsonic flow p 413 A86-33236
An aerodynamic analysis computer program and design notes for low speed wing flap systems
[NASA-CR-3675] p 408 N86-23554
**SUBSONIC WIND TUNNELS**
Recent improvements to the NAE 5 ft. x 5 ft. blowdown wind tunnel
[AD-A162034] p 449 N86-23608
**SUBSTITUTES**
Potential of composite materials to replace chromium, cobalt and manganese in critical applications
[PB86-123965] p 451 N86-22651
**SUPERCRITICAL AIRFOILS**
Comparative study between two Navier-Stokes algorithms for transonic airfoils p 411 A86-32966
The passive control of the shock waves on transonic airfoils p 411 A86-32990
Exact closed-form solutions for nonlinear unsteady transonic aerodynamics p 412 A86-33231
**SUPERCRITICAL WINGS**
Geometric and structural properties of a rectangular supercritical wing oscillated in pitch for measurement of unsteady transonic pressure distributions
[NASA-TM-85673] p 416 N86-23567
**SUPERSONIC AIRCRAFT**
What technologies await the future airliner?
p 405 A86-31038
Development and flight testing of the T-2 control configured vehicle
[AIAA PAPER 86-9763] p 429 A86-32101
Experimental analysis of a pitot-type air intake
p 410 A86-32777
Aerodynamic characteristics of a supersonic fighter aircraft model at Mach 0.40 to 2.47
[NASA-TP-2580] p 416 N86-23561
**SUPERSONIC AIRFOILS**
Optimum supersonic wings with subsonic leading edges p 410 A86-32785
Airfoil design at sonic velocity p 411 A86-32989
The passive control of the shock waves on transonic airfoils p 411 A86-32990
**SUPERSONIC COMBUSTION RAMJET ENGINES**
User's guide for NASCRIN: A vectorized code for calculating two-dimensional supersonic internal flow fields
[NASA-TM-85708] p 416 N86-23565
**SUPERSONIC FLOW**
Euler and Navier-Stokes solutions for flow over a conical delta wing p 411 A86-32960
Prediction of advanced propeller noise in the time domain p 469 A86-32963
An improved potential gradient method for the calculation of unsteady aerodynamic pressures on oscillating wings in supersonic flow p 413 A86-33234
An exact formulation of the unsteady aerodynamic theory of lifting surfaces undergoing arbitrary small motions in a supersonic flow field p 413 A86-33235
Random-choice-method solutions for two-dimensional planar and axisymmetric steady supersonic flows
[UTIAS-297] p 415 N86-22555
User's guide for NASCRIN: A vectorized code for calculating two-dimensional supersonic internal flow fields
[NASA-TM-85708] p 416 N86-23565
**SUPERSONIC FLUTTER**
Aerodynamic and structural detuning of supersonic turbomachine rotors p 440 A86-31595
Influence of friction dampers on torsional blade flutter
[ASME PAPER 85-GT-170] p 441 A86-32957
**SUPERSONIC INLETS**
Throttle dependent forces: A primer
[AD-A162939] p 442 N86-23599
**SUPERSONIC JET FLOW**
Supersonic interface instabilities of accelerated surfaces and jets p 455 A86-31356
**SUPERSONIC SPEEDS**
Effects of some geometric variations on missile aerodynamic characteristics at supersonic speeds
[NASA-TM-87683] p 415 N86-22553

Nonlinear potential analysis techniques for supersonic-hypersonic aerodynamic design
[NASA-CR-172299] p 417 N86-23569

**SUPPORT SYSTEMS**
Long range planning for flight test support
[AIAA PAPER 86-9744] p 406 A86-32088

**SUPPRESSORS**
Free jet feasibility study of a thermal acoustic shield concept for AST/VCE application-dual flow. Comprehensive data report. Volume 1: Test nozzles and acoustic data
[NASA-CR-174817] p 469 N86-23371

**SURFACE ROUGHNESS EFFECTS**
A review of computer simulations for aircraft-surface dynamics p 432 A86-32776

**SURVEILLANCE RADAR**
Aerial navigation p 421 A86-31006
Advances in secondary surveillance radar systems p 423 A86-32581
Detection and recognition of hazardous weather conditions by primary surveillance radar p 457 A86-32614
Space-based bistatic radar - Opportunity for future tactical air surveillance p 423 A86-32627

**SURVIVAL**
Survival of helicopter accidents p 419 A86-31005

**SWEDEN**
How Sweden decided to build the Gripen p 405 A86-31340
Sweden's Gripen - A tough bird to tangle with p 427 A86-31341

**SWEPT FORWARD WINGS**
Management controls on the X-29 flight-control system software development
[AIAA PAPER 86-9808] p 443 A86-32136
The application of practical optimization techniques in the preliminary structural design of a forward-swept wing p 433 A86-33256
Locally linearized longitudinal and lateral-directional aerodynamic stability and control derivaties for the X-29A aircraft
[NASA-TM-84919] p 416 N86-23566

**SWEPT WINGS**
Effects of anisotropic design on the static aeroelasticity of a swept wing p 434 A86-33263

**SYNTHETIC APERTURE RADAR**
An investigation of synthetic aperture radar autofocus
[AD-A161912] p 460 N86-23783

**SYNTHETIC FUELS**
Scientists on aircraft development trends p 407 N86-22545

**SYSTEM EFFECTIVENESS**
Principles of flight test
[AIAA PAPER 86-9742] p 406 A86-32087
Operational suitability evaluation of a tactical fighter system
[AIAA PAPER 86-9753] p 406 A86-32094

**SYSTEM IDENTIFICATION**
Comparison of some time domain methods for structural system identification p 457 A86-33279

**SYSTEMS ANALYSIS**
X-29 ground and flight subsystem testing
[AIAA PAPER 86-9781] p 430 A86-32115
Estimation of the state parameters of nonlinear dynamic systems p 465 A86-33047
Dynamic assertion testing of flight control software
[NASA-CR-176712] p 466 N86-23322
Dynamic assertion testing of flight control software
[NASA-CR-176716] p 466 N86-23325

**SYSTEMS ENGINEERING**
A peripheral integrated system status display - Figural goodness or proximity effects? p 453 A86-29870
The NDS 2000 Flight Test Instrumentation System in the F-20 Tigershark
[AIAA PAPER 86-9797] p 438 A86-32126
Rivista Technica Selenia, volume 9, number 3, 1985 --- combat aircraft p 407 N86-22537
The MRCA automatic test system p 407 N86-22538
Selenia's contribution to the development of systems support: Microwave Automatic Test Equipment (ATE) --- combat aircraft p 407 N86 22540
Lines of evolution --- automatic test equipment, military aircraft p 407 N86-22543
Activities report of the Department of Aerospace Engineering p 470 N86-23491
A systems engineering methodology for the advanced tactical aircraft
[AD-A162049] p 437 N86-23593

**SYSTEMS INTEGRATION**
Experience with flight testing integrated avionics systems
[AIAA PAPER 86-9804] p 431 A86-32133
Integration test facility for P3 aircraft purpose and uses
[AIAA PAPER 86-9807] p 448 A86-32135

**SYSTEMS MANAGEMENT**
A systems engineering methodology for the advanced tactical aircraft
[AD-A162049] p 437 N86-23593

**SYSTEMS SIMULATION**
1985 Summer Computer Simulation Conference, Chicago, IL, July 22-24, 1985, Proceedings p 464 A86-30351
All about simulators, 1984; Proceedings of the Simulators Conference, Norfolk, VA, April 16-20, 1984 p 464 A86-31252

**SYSTEMS STABILITY**
Stability of a nonlinear stochastic system under periodic excitation --- for helicopter rotor vibration p 444 A86-32657
Finite state modelling of aeroelastic systems for active control applications - A general theory p 444 A86-33249

## T

**T-2 AIRCRAFT**
Development and flight testing of the T-2 control configured vehicle
[AIAA PAPER 86-9763] p 429 A86-32101

**TAILLESS AIRCRAFT**
Aeroelastic problems and structural design of a tailless CFC-sailplane p 434 A86-33264

**TAKEOFF**
Noise emission from jet aircraft during take-off roll with respect to noise exposure calculations p 467 A86-31957
Improvements to the FATOLA computer program including added actively controlled landing gear subroutines
[NASA-CR-166069] p 436 N86-23588
Analysis of data from NASA B-57B gust gradient program
[NASA-CR-178736] p 446 N86-23604

**TAKEOFF RUNS**
Maneuvers for aircraft noise reduction in takeoff, climb, and landing approach operations p 467 A86-31010
Accident of the DC-10 EC-DEG aircraft at Malaga on September 13, 1982 p 419 A86-31011
Investigation of main landing gear tire temperatures during taxy-out at heavy take-off masses
[AIAA PAPER 86-9778] p 430 A86-32113

**TAR SANDS**
Turbine fuels from tar sands bitumen and heavy oil. Phase 1: Preliminary process analysis
[AD-A161300] p 452 N86-22724

**TARGET ACQUISITION**
Detectability of low flying targets in real terrain using a diffraction model p 457 A86-32605

**TARGET RECOGNITION**
Effect of radar frequency on the detection of shaped (low RCS) targets p 456 A86-32603

**TAXIING**
Simulation of aircraft taxi testing on the AGILE shaker test facility p 448 A86-33265

**TECHNOLOGICAL FORECASTING**
What technologies await the future airliner? p 405 A86-31038
Cockpits for 2010 and beyond p 427 A86-31849

**TECHNOLOGY ASSESSMENT**
Aerospace and electronic systems - Advanced concepts and pioneering perspectives; Proceedings of the Sixth Symposium, Dayton, OH, November 14, 15, 1984 p 455 A86-31253
Navigation in aerial commerce p 422 A86-31323
Airlines and the new technology aircraft - A discussion paper p 419 A86-31325
X-aircraft for world leadership in aeronautics p 405 A86-31330
X-29 revives the experimental aircraft p 426 A86-31331
X-29 flight - Acid test for design predictions p 426 A86-31333
Soviet aircraft close technology gap p 427 A86-31336
Mission control features at Yuma proving ground
[AIAA PAPER 86-9745] p 447 A86-32089
International Helicopter Forum, 15th and International Aerospace Exhibition, Hanover, West Germany, May 20-27, 1984, Reports p 407 A86-33300

**TECHNOLOGY TRANSFER**
China report: Science and technology
[JPRS-CST-86-007] p 435 N86-22570

**TECHNOLOGY UTILIZATION**
X-29 aims at applications p 426 A86-31334
Thin film electroluminescent (TFEL) display optimized for cockpit applications p 456 A86-32321
Space based radar application to air traffic control p 423 A86-32626
FAA Air Traffic Control program management technology applications p 424 A86-32925
The development of aluminum-lithium alloys for aerospace applications p 451 N86-22616
Advanced composite structures in commercial transport aircraft
[AI/TE3-384/82-ISSUE-2] p 451 N86-22648

**TELEMETRY**
Real-time telemetered inertial guidance (TMIG) evaluation
[AIAA PAPER 86-9795] p 449 A86-32124
Telemetry processing system
[AIAA PAPER 86-9825] p 465 A86-32148

**TELEVISION EQUIPMENT**
Development of a raster/stroke full-color TV projector for simulation p 456 A86-32320

**TEMPERATURE MEASUREMENT**
Investigation of main landing gear tire temperatures during taxy-out at heavy take-off masses
[AIAA PAPER 86-9778] p 430 A86-32113

**TENSILE STRESS**
MEP: A program for cross section magnitudes of a multicell wing profile
[VTH-M-487] p 459 N86-23013

**TERMINAL GUIDANCE**
Parameters of a dedicated weather radar for terminal air navigation, traffic control and safety p 423 A86-32616

**TERRAIN**
After action report, CH-47 recovery using D-PAAC
[AD-A161935] p 437 N86-23589

**TERRAIN ANALYSIS**
A laser-inertial airborne surveying system p 438 A86-30315

**TERRAIN FOLLOWING AIRCRAFT**
Detectability of low flying targets in real terrain using a diffraction model p 457 A86-32605

**TEST FACILITIES**
The National Transonic Facility p 447 A86-31847
Mission control features at Yuma proving ground
[AIAA PAPER 86-9745] p 447 A86-32089
The MBB flight test centre and its facilities
[AIAA PAPER 86-9746] p 447 A86-32090
Integration test facility for P3 aircraft purpose and uses
[AIAA PAPER 86-9807] p 448 A86-32135
Simulation of aircraft taxi testing on the AGILE shaker test facility p 448 A86-33265

**TEST RANGES**
Mission control features at Yuma proving ground
[AIAA PAPER 86-9745] p 447 A86-32089
Tracking radars at flight test ranges
[AIAA PAPER 86-9747] p 447 A86-32091
Air Force Flight Test Center range overview
[AIAA PAPER 86-9748] p 448 A86-32092
Bird impact testing at AEDC's range S-3
[AIAA PAPER 86-9818] p 432 A86-32143
Radar cross section testing
[AIAA PAPER 86-9828] p 448 A86-32150

**THERMAL ANALYSIS**
Thermophysics of decomposing materials --- Russian book p 451 A86-33323

**THERMAL CONTROL COATINGS**
New space paints p 451 N86-22621
Ceramic thermal barrier coatings for electric utility gas turbine engines
[NASA-TM-87288] p 452 N86-22687
Thermal barrier coating life prediction model development
[NASA-CR-175087] p 452 N86-22713

**THERMAL DECOMPOSITION**
Thermophysics of decomposing materials --- Russian book p 451 A86-33323

**THERMAL INSULATION**
Thermophysics of decomposing materials --- Russian book p 451 A86-33323

**THERMOPHYSICAL PROPERTIES**
Thermophysics of decomposing materials --- Russian book p 451 A86-33323

**THIN FILMS**
Thin film electroluminescent (TFEL) display optimized for cockpit applications p 456 A86-32321

**THIN PLATES**
A stress intensity factor solution due to holes ahead of growing cracks in thin sheet material p 454 A86-31123

**THIN WALLED SHELLS**
A mathematical model for structures consisting of elastic shell sections connected by open girders p 456 A86-31420

**THIN WINGS**
On the exact solution of the linearized lifting-surface problem of an elliptic wing p 409 A86-31132

**THREE DIMENSIONAL FLOW**
Outer surface of airplane and computational grid for flow analysis in physical space p 409 A86-31022

READEX FICHE best copy available

Unsteady stall modelling in three-dimensional flow p 409 A86-32154
Transonic Equivalent Strip method for aeroelastic applications p 412 A86-33228
Calculation of 3-d unsteady transonic potential flows by a field panel method p 412 A86-33229
Optimization of tip store modeling [AD-A162119] p 417 N86-23571
A zonal approach to the design of finite element grids for 3-D transonic flows with complex geometries [AD-A162168] p 417 N86-23572
Three-dimensional flow in compressors and channels [AD-A161858] p 460 N86-23873

**THROTTLING**
Throttle dependent forces: A primer [AD-A162939] p 442 N86-23599

**THRUST VECTOR CONTROL**
Static investigation of two STOL nozzle concepts with pitch thrust-vectoring capability [NASA-TP-2559] p 415 N86-23559

**TILT ROTOR AIRCRAFT**
Major short-haul role seen for tilt-rotor aircraft p 420 A86-33427
The US Army's LHX (light helicopter family) program [AD-A161949] p 437 N86-23591

**TIME DEPENDENCE**
Unsteady aerodynamics in time and frequency domains for finite-time arbitrary motion of helicopter rotor blades in hover and forward flight p 414 N86-22548

**TIP VANES**
Aeroelastic research on wind turbines [VTH-M-474] p 459 N86-23012
Aeroelastic research on wind turbines [VTH-M-501] p 459 N86-23014
Aeroelastic research on wind turbines [VTH-M-517] p 459 N86-23016

**TIRES**
Investigation of main landing gear tire temperatures during taxy-out at heavy take-off masses [AIAA PAPER 86-9778] p 430 A86-32113

**TITANIUM ALLOYS**
Durability and damage-tolerance design and analysis of titanium airframe structures p 454 A86-30091

**TOLERANCES (MECHANICS)**
The application of fracture mechanics methodology to the damage tolerance analysis of the Boeing 757 airplane p 425 A86-30090
Durability and damage-tolerance design and analysis of titanium airframe structures p 454 A86-30091
Logistics engineering analysis techniques for fault-tolerant avionics systems [AD-A161981] p 439 N86-23596

Single heading climbs - An alternate technique for determining performance --- in jet transport flight tests [AIAA PAPER 86-9757] p 429 A86-32098
Acoustical design economic tradeoff for transport aircraft --- J p 466 A86-32783
Windtunnel test and laboratory simulation of a load alleviation system for a modern transport aircraft p 445 A86-33252
Flow prediction for propfan engine installation effects on transport aircraft at transonic speeds [NASA-CR-3954] p 414 N86-22550
The Australian implementation of AMDAR/ACARS and the use of derived equivalent gust velocity as a turbulence indicator [AR-004-51] p 420 N86-22560
A methodology for airplane parameter estimation and confidence interval determination in nonlinear estimation problems [NASA-RP-1153] p 445 N86-22579
Low-speed stability and control characteristics of a transport model with aft-fuselage-mounted advanced turboprops [NASA-TP-2535] p 445 N86-22580
Effects of upper-surface nacelles on longitudinal aerodynamic characteristics of high-wing transport configuration [NASA-TP-2579] p 416 N86-23562
Preliminary hazard analysis for self-contained navigation system [AD-A161883] p 425 N86-23582

**TRANSPORTATION NETWORKS**
USSR report: Transportation [JPRS-UTR-86-004] p 435 N86-22565

**TRENDS**
Lines of evolution --- automatic test equipment, military aircraft p 407 N86-22543

**TUPOLEV AIRCRAFT**
Tupolev bureau developing TU-204 passenger jet: Tupolev on features p 435 N86-22568

**TURBINE BLADES**
A method for computer aided design of transonic turbine cascade p 409 A86-30734
Aerodynamic and structural detuning of supersonic turbomachine rotors p 440 A86-31595

**TURBINE ENGINES**
Natural laminar flow flight experiments on a turbine engine nacelle fairing [AIAA PAPER 86-9756] p 429 A86-32097
Turbine fuels from tar sands bitumen and heavy oil. Phase 1: Preliminary process analysis [AD-A161300] p 452 N86-22724

**TURBINE WHEELS**
Short crack problems in gas turbine disks p 440 A86-30093

**TURBINES**
Extended parametric representation of compressor fans and turbines. Volume 2: Part user's manual (parametric turbine) [NASA-CR-174646] p 461 N86-23937

**TURBOCOMPRESSORS**
Modelling an axial flow compressor in starting of a turbojet engine p 440 A86-30737

**TURBOJET ENGINES**
Modelling an axial flow compressor in starting of a turbojet engine p 440 A86-30737
Experimental investigation on frequency response of a turbojet engine to turbulence-type dynamic distortion p 440 A86-30740

**TURBOPROP AIRCRAFT**
Details of Y-12 STOL aircraft presented p 436 N86-22573

**TURBOPROP ENGINES**
Low-speed wind-tunnel tests of single- and counter-rotation propellers [NASA-TM-87656] p 415 N86-22552

**TURBULENCE**

Investigation of the dynamic response of aircraft to microburst (JAWS) wind shear p 445 N86-22578

Storm precipitation and wind structure during aircraft strike lightning events [AD-A162338] p 463 N86-24100

**TURBULENCE EFFECTS**

Experimental investigation on frequency response of a turbojet engine to turbulence-type dynamic distortion p 440 A86-30740

**TURBULENT BOUNDARY LAYER**

Turbulent boundary-layer wall pressure fluctuations downstream of a tandem LEBU — Large-Eddy BreakUp devices p 457 A86-32984

**TURBULENT FLOW**

Simulation of inviscid vortex-stretched turbulent shear-layer flow p 411 A86-32979

**TWISTED WINGS**

Anisotropic wing aeroelastic theories with warping effects p 434 A86-33261

**TWO DIMENSIONAL FLOW**

Mach reflection and aerodynamic choking in two-dimensional ducted flow p 411 A86-32987

Impinging jets p 458 A86-33419

User's guide for NASCRIN: A vectorized code for calculating two-dimensional supersonic internal flow fields [NASA-TM-85708] p 416 N86-23585

## U

**U.S.S.R.**

Soviet aircraft close technology gap p 427 A86-31336

USSR report: Transportation [JPRS-UTR-86-004] p 435 N86-22565

**ULTRASONIC RADIATION**

Ultrasonic characterization of microstructure in powder metal alloy p 469 N86-22964

**ULTRASONIC TESTS**

Fatigue of structural materials at high-frequency cycle loading p 453 A86-30019

**ULTRASONICS**

Ultrasonic characterization of microstructure in powder metal alloy p 469 N86-22964

**UNSTEADY FLOW**

Unsteady stall modelling in three-dimensional flow p 409 A86-32154

Solution of the unsteady Euler equations for fixed and rotor wing configurations p 410 A86-32779

Dynamic stall inception correlation for airfoils undergoing constant pitch rate motions p 411 A86-32978

Application of transonic unsteady methods for calculation of flutter airloads p 412 A86-33230

Exact closed-form solutions for nonlinear unsteady transonic aerodynamics p 412 A86-33231

Recent transonic unsteady pressure measurements at the NASA Langley Research Center Center p 412 A86-33232

An exact formulation of the unsteady aerodynamic theory of lifting surfaces undergoing arbitrary small motions in a supersonic flow field p 413 A86-33235

Application of unsteady wing collocation methods to cascades in subsonic flow p 413 A86-33236

A new look at arbitrary motion unsteady aerodynamics and its application to rotary-wing aeroelasticity p 413 A56-33238

Coupling linearized far-field boundary conditions with nonlinear near-field solutions in transonic flow [AD-A162334] p 417 N86-23573

**URBAN TRANSPORTATION**

USSR report: Transportation [JPRS-UTR-86-004] p 435 N86-22565

**USER MANUALS (COMPUTER PROGRAMS)**

Numerical analysis of inviscid flows About wing-fuselage combinations. Part 1: Development of grid generation code YOKUDO-G [NAL-TR-864] p 414 N86-22551

User's guide for NASCRIN: A vectorized code for calculating two-dimensional supersonic internal flow fields [NASA-TM-85708] p 416 N86-23585

**USER REQUIREMENTS**

Implicit activities in the post development phase — test equipment systems, combat aircraft p 407 N86-22542

Extended parametric representation of compressor fans and turbines. Volume 1: CMGEN user's manual [NASA-CR-174645] p 460 N86-23936

Extended parametric representation of compressor fans and turbines. Volume 2: Part user's manual (parametric turbine) [NASA-CR-174646] p 461 N86-23937

Extended parametric representation of compressor fans and turbines. Volume 3: MODFAN user's manual (parametric modulating flow fan) [NASA-CR-174647] p 461 N86-23938

**UTILITIES**

Ceramic thermal barrier coatings for electric utility gas turbine engines [NASA-TM-87288] p 452 N86-22687

**UTILITY AIRCRAFT**

Development of a computer-managed readiness assessment system [AD-A162931] p 463 N86-24215

## V

**V/STOL AIRCRAFT**

Investigation to advance prediction techniques of the low-speed aerodynamics of V/STOL aircraft [NASA-CR-166479] p 416 N86-23568

**VALVES**

Fuel pump vent drain system [AD-D011993] p 459 N86-22947

**VARIABLE CYCLE ENGINES**

Free jet feasibility study of a thermal acoustic shield concept for AST/VCE application-dual flow. Comprehensive data report. Volume 1: Test nozzles and acoustic data [NASA-CR-174817] p 469 N86-23371

Free-jet feasibility study of a thermal acoustic shield concept for AST/VCE application-dual stream nozzles. Comprehensive data report. Volume 2: Laser velocimeter and suppressor. Base pressure data [NASA-CR-174818] p 469 N86-23372

**VENEERS**

Flexural properties of carbon fibre cloth/wood veneer laminates [AD-A161921] p 452 N86-23663

**VENTS**

Fuel pump vent drain system [AD-D011993] p 459 N86-22947

**VERBAL COMMUNICATION**

Operational acceptability of 2.4 kbps speech for tactical communications p 424 A86-32823

**VERTICAL AIR CURRENTS**

An ill wind — wind shear p 461 A86-31225

A numerical analysis for vertical gust field induced by gust generator p 432 A86-33237

**VERTICAL TAKEOFF AIRCRAFT**

Major short-haul role seen for tilt-rotor aircraft p 420 A86-33427

**VIBRATION DAMPING**

Free vibration characteristics of periodically stiffened panels with damped stringers p 456 A86-31773

Influence of friction dampers on torsional blade flutter [ASME PAPER 85-GT-170] p 441 A86-32957

A review of aeroelastic research at the flight dynamics laboratory p 433 A86-33242

Development of a flutter suppression control law by use of Linear Quadratic Gaussian and constrained optimization design techniques p 444 A86-33248

Improved Y-7, Y-12 aircraft described p 436 N86-22572

**VIBRATION ISOLATORS**

Structural dynamic aspects of rotor nodal isolation p 434 A86-33267

**VIBRATION MEASUREMENT**

Determination of natural vibration properties of a wing with winglet by experimental mode synthesis technique p 435 A86-33280

**VIBRATION MODE**

Static aeroelastic analysis using aircraft vibration modes p 432 A86-33241

Comparison of some time domain methods for structural system identification p 457 A86-33279

Determination of natural vibration properties of a wing with winglet by experimental mode synthesis technique p 435 A86-33280

Rapid vibration mode analysis of aircraft with external stores p 435 A86-33281

**VIBRATION TESTS**

Fatigue of structural materials at high-frequency cycle loading p 453 A86-30019

Dynamic characteristics of an assembly of prop-fan blades [ASME PAPER 85-GT-134] p 441 A86-32956

**VIDEO EQUIPMENT**

160 megapixels per second 2000 line display p 456 A86-32318

**VISCOPLASTICITY**

La Recherche Aerospatiale, bimonthly bulletin, number 1985-1, 224/January-February [ESA-TT-915] p 458 N86-22729

**VISCOUS FLUIDS**

Recombination of vortex filaments and its role in aerodynamic noise p 408 A86-30213

**VOICE COMMUNICATION**

Assessing the intelligibility and acceptability of voice communication systems p 424 A86-32824

**VOICE CONTROL**

New interfaces in the cockpit p 427 A86-31346

**VORTEX BREAKDOWN**

Turbulent boundary-layer wall pressure fluctuations downstream of a tandem LEBU — Large-Eddy BreakUp devices p 457 A86-32984

**VORTEX FILAMENTS**

Recombination of vortex filaments and its role in aerodynamic noise p 408 A86-30213

**VORTEX GENERATORS**

Vortex boundary-layer interactions [NASA-CR-176701] p 415 N86-22556

**VORTEX SHEDDING**

Numerical simulation of vortices shed behind a rotating wing p 418 N86-23862

**VORTICES**

In-flight flow visualization of F-106B leading-edge vortex using the vapor-screen technique [AIAA PAPER 86-9785] p 431 A86-32118

Investigation of vortex patterns on slender bodies at high angles of attack p 410 A86-32784

Simulation of inviscid vortex-stretched turbulent shear-layer flow p 411 A86-32979

Numerical simulation of vortices shed behind a rotating wing p 418 N86-23862

**VORTICITY EQUATIONS**

Recombination of vortex filaments and its role in aerodynamic noise p 408 A86-30213

**VULNERABILITY**

Logistics engineering analysis techniques for fault-tolerant avionics systems [AD-A161981] p 439 N86-23596

## W

**WALL PRESSURE**

Turbulent boundary-layer wall pressure fluctuations downstream of a tandem LEBU — Large-Eddy BreakUp devices p 457 A86-32984

**WARNING SYSTEMS**

New CFAR-processor based on an ordered statistic p 457 A86-32618

**WASTE TREATMENT**

China report: Science and technology [JPRS-CST-86-004] p 458 N86-22735

**WAVE PROPAGATION**

Ultrasonic characterization of microstructure in powder metal alloy p 469 N86-22964

**WAVEFORMS**

The 1982 direct strike lightning data [NASA-TM-84626] p 463 N86-24091

**WEAPON SYSTEMS**

Cockpits for 2010 and beyond p 427 A86-31849

Combined test force operations at the Air Force Flight Test Center [AIAA PAPER 86-9739] p 406 A86-32085

**WEAPONS DEVELOPMENT**

Airborne infrared measurement systems and techniques [AIAA PAPER 86-9814] p 439 A86-32140

**WEAR INHIBITORS**

Phosphorus anti-wear additives in helicopter transmissions [IC-TS015/85] p 452 N86-22710

**WEAR TESTS**

Phosphorus anti-wear additives in helicopter transmissions [IC-TS015/85] p 452 N86-22710

**WEATHER**

Detection and recognition of hazardous weather conditions by primary surveillance radar p 457 A86-32614

**WEATHER FORECASTING**

Tomorrow's weather - New accuracy in forecasting p 462 A86-32450

**WEDGE FLOW**

Transient motion of a hypersonic wedge, including time history effects p 443 A86-31662

**WEIGHT (MASS)**

The US Army's LHX (light helicopter family) program [AD-A161949] p 437 N86-23591

**WEIGHT REDUCTION**

Structural optimisation programs and methods — computer aided aircraft design p 434 A86-33257

**WEIGHTING FUNCTIONS**

Computationally simple adaptive tracking filters based on weighted averages p 457 A86-32642

An evaluation of CPRA (Cost Performance Report Analysis) estimate at completion techniques based upon AFWAL (Air Force Wright Aeronautical Laboratories) cost/schedule control system criteria data [AD-A162282] p 470 N86-24584

**WIND DIRECTION**
The Australian implementation of AMDAR/ACARS and the use of derived equivalent gust velocity as a turbulence indicator
[AR-004-51] p 420 N86-22560
Storm precipitation and wind structure during aircraft strike lightning events
[AD-A162338] p 463 N86-24100

**WIND PROFILES**
The Australian implementation of AMDAR/ACARS and the use of derived equivalent gust velocity as a turbulence indicator
[AR-004-51] p 420 N86-22560

**WIND SHEAR**
An ill wind --- wind shear p 461 A86-31225
Wind shear estimation by frequency-shaped optimal estimator p 464 A86-31656
Tomorrow's weather - New accuracy in forecasting
p 462 A86-32450
Investigation of the dynamic response of aircraft to microburst (JAWS) wind shear p 445 N86-22578
Extensions to PIFCGT: Multirate output feedback and optimal disturbance suppression
[NASA-CR-3968] p 446 N86-22581
Storm precipitation and wind structure during aircraft strike lightning events
[AD-A162338] p 463 N86-24100

**WIND TUNNEL DRIVES**
Modifications to the 4x7 meter tunnel for acoustic research: Engineering feasibility study
[NASA-CR-178079] p 470 N86-24394

**WIND TUNNEL MODELS**
NLR experience in the application of active flutter suppression and gust load alleviation, applied to a wind-tunnel model p 444 A86-33250

**WIND TUNNEL TESTS**
A correction of the angle of incidence for a two-dimensional wing model in the closed test section
p 409 A86-31020
The German-Dutch wind tunnel - An aeroacoustics experimentator's dream p 468 A86-31965
A new rain/ice test capability to simulate flight
[AIAA PAPER 86-9824] p 432 A86-32147
Experimental analysis of a pitot-type air intake
p 410 A86-32777
Aerodynamic parameters estimated from flight and wind tunnel data p 410 A86-32782
Recent transonic unsteady pressure measurements at the NASA Langley Research Center Center
p 412 A86-33232
Steady and unsteady pressure distributions on various profiles in separated subsonic and transonic flow
p 413 A86-33233
A review of aeroelastic research at the flight dynamics laboratory p 433 A86-33242
Selected topics in experimental aeroelasticity at the NASA Langley Research Center p 433 A86-33243
Aeroelastic wind tunnel similarity theory for anisotropic aircraft wings p 433 A86-33244
The design and wind tunnel demonstration of an active control system for gust load alleviation and flutter suppression p 445 A86-33251
Windtunnel test and laboratory simulation of a load alleviation system for a modern transport aircraft
p 445 A86-33252
Low-speed wind-tunnel tests of single- and counter-rotation propellers
[NASA-TM-87656] p 415 N86-22552
Supersonic axial-force characteristics of a rectangular-box cavity with various length-to-depth ratios in a flat plate
[NASA-TM-87659] p 415 N86-22554
Wind tunnel tests of rotor blade sections with replications of ice formations accreted in hover
[NASA-CR-175089] p 420 N86-22558
Some lessons learned with wind tunnels
[NASA-TM-87710] p 408 N86-23555
Effects of upper-surface nacelles on longitudinal aerodynamic characteristics of high-wing transport configuration
[NASA-TP-2579] p 416 N86-23562
Geometric and structural properties of a rectangular supercritical wing oscillated in pitch for measurement of unsteady transonic pressure distributions
[NASA-TM-85673] p 416 N86-23567
Modifications to the 4x7 meter tunnel for acoustic research: Engineering feasibility study
[NASA-CR-178079] p 470 N86-24394

**WIND TUNNELS**
The German-Dutch wind tunnel - An aeroacoustics experimentator's dream p 468 A86-31965

**WIND VELOCITY**
The Australian implementation of AMDAR/ACARS and the use of derived equivalent gust velocity as a turbulence indicator
[AR-004-51] p 420 N86-22560

**WINDOWS (APERTURES)**
Aircraft window clamping device
[AD-D011909] p 435 N86-22564

**WINDPOWER UTILIZATION**
Aeroelastic research on wind turbines
[VTH-M-474] p 459 N86-23012
Aeroelastic research on wind turbines
[VTH-M-501] p 459 N86-23014
Aeroelastic research on wind turbines
[VTH-M-517] p 459 N86-23016

**WINDSHIELDS**
Bird impact testing at AEDC's range S-3
[AIAA PAPER 86-9818] p 432 A86-32143

**WING FLAPS**
An aerodynamic analysis computer program and design notes for low speed wing flap systems
[NASA-CR-3675] p 408 N86-23554

**WING FLOW METHOD TESTS**
A correction of the angle of incidence for a two-dimensional wing model in the closed test section
p 409 A86-31020

**WING OSCILLATIONS**
Improved numerical method for lifting airfoils with oscillating control surfaces in subsonic flow
p 409 A86-31021
Flight test of a decoupler pylon for wing/store flutter suppression
[AIAA PAPER 86-9730] p 428 A86-32077
Calculation of 3-d unsteady transonic potential flows by a field panel method p 412 A86-33229
An improved potential gradient method for the calculation of unsteady aerodynamic pressures on oscillating wings in supersonic flow p 413 A86-33234
Application of unsteady wing collocation methods to cascades in subsonic flow p 413 A86-33236
Aeroelastic wind tunnel similarity theory for anisotropic aircraft wings p 433 A86-33244
Anisotropic wing aeroelastic theories with warping effects p 434 A86-33261

**WING PLANFORMS**
On the exact solution of the linearized lifting-surface problem of an elliptic wing p 409 A86-31132
Optimum supersonic wings with subsonic leading edges p 410 A86-32785
Effects of some geometric variations on missile aerodynamic characteristics at supersonic speeds
[NASA-TM-87683] p 415 N86-22553

**WING PROFILES**
Flow structure at the windward side of conical wings with an attached shock wave at the leading edge
p 410 A86-32739
Determination of natural vibration properties of a wing with winglet by experimental mode synthesis technique
p 435 A86-33260
MEP: A program for cross section magnitudes of a multicell wing profile
[VTH-M-487] p 459 N86-23013

**WING SPAN**
Effects of some geometric variations on missile aerodynamic characteristics at supersonic speeds
[NASA-TM-87683] p 415 N86-22553

**WING TIPS**
Optimization of tip store modeling
[AD-A162119] p 417 N86-23571

**WINGLETS**
Determination of natural vibration properties of a wing with winglet by experimental mode synthesis technique
p 435 A86-33260

**WINGS**
Unsteady transonic flow calculations for two-dimensional canard-wing configurations
p 410 A86-32780
Comparison of measured and calculated temperatures for a Mach 8 hypersonic wing test structure
[NASA-TM-85918] p 435 N86-22563
Numerical simulation of vortices shed behind a rotating wing p 418 N86-23862

**X**

**X-29 AIRCRAFT**
X-aircraft for world leadership in aeronautics
p 405 A86-31330
X-29 revives the experimental aircraft
p 426 A86-31331
Unusual aerodynamics of X-29 p 426 A86-31332
X-29 flight - Acid test for design predictions
p 426 A86-31333
X-29 aims at applications p 426 A86-31334
X-29A advanced technology demonstrator program overview
[AIAA PAPER 86-9727] p 428 A86-32076
X-29A flight flutter data analysis by advanced methods
[AIAA PAPER 86-9737] p 429 A86-32083
Real-time open-loop frequency response analysis of flight test data
[AIAA PAPER 86-9738] p 443 A86-32084
X-29 ground and flight subsystem testing
[AIAA PAPER 86-9781] p 430 A86-32115
Management controls on the X-29 flight-control system software development
[AIAA PAPER 86-9808] p 443 A86-32136
The application of practical optimization techniques in the preliminary structural design of a forward-swept wing
p 433 A86-33256
Locally linearized longitudinal and lateral-directional aerodynamic stability and control derivaties for the X-29A aircraft
[NASA-TM-84919] p 416 N86-23566

**Y**

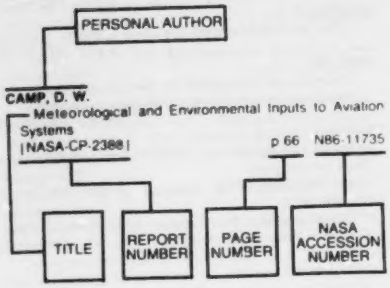
**YAWING MOMENTS**
Validation of USAF stability and control Datcom methodologies for straight-tapered sweptforward wings
[AD-A161876] p 417 N86-23570

# PERSONAL AUTHOR INDEX

**AERONAUTICAL ENGINEERING** / *A Continuing Bibliography (Supplement 203)*

AUGUST 1986

## Typical Personal Author Index Listing



Listings in this index are arranged alphabetically by personal author. The title of the document provides the user with a brief description of the subject matter. The report number helps to indicate the type of document listed (e.g., NASA report, translation, NASA contractor report). The page and accession numbers are located beneath and to the right of the title. Under any one author's name the accession numbers are arranged in sequence with the AIAA accession numbers appearing first.

## A

**ABE, K.**
A correction of the angle of incidence for a two-dimensional wing model in the closed test section
p 409 A86-31020

**ADAMS, W. M., JR.**
Development of a flutter suppression control law by use of Linear Quadratic Gaussian and constrained optimization design techniques p 444 A86-33248

**ADAMSON, T. C., JR.**
Three-dimensional flow in compressors and channels
[AD-A161858] p 460 N86-23873

**ADREEVSKII, V. V.**
The aeromechanics of aircraft: Flight dynamics (2nd revised and enlarged edition) p 442 A86-30925

**AGARWALA, V. S.**
Multipurpose corrosion inhibitors for aerospace alloys in naval environments p 450 A86-33021

**AHAO, Y.**
A method for computer aided design of transonic turbine cascade p 409 A86-30734

**AHLBERG, L. A.**
Ultrasonic characterization of microstructure in powder metal alloy p 469 N86-22964

**AKSENOV, L. N.**
Thermophysics of decomposing materials
p 451 A86-33323

**ALEKSANDROV, A. IA.**
Calculation of structural elements of aircraft: Sandwich plates and shells p 458 A86-33292

**ALLAND, S.**
Effect of radar frequency on the detection of shaped (low RCS) targets p 456 A86-32603

**ALLBURN, J. N.**
X-29 revives the experimental aircraft
p 426 A86-31331

**AMICO, V.**
All about simulators, 1984; Proceedings of the Simulators Conference, Norfolk, VA, April 18-20, 1984
p 484 A86-31252

**ANDERSON, B. W.**
Factors affecting the design of military aircraft structures in carbon fibre reinforced composites
p 449 A86-29972

**ANDREWS, D. M.**
Dynamic assertion testing of flight control software
[NASA-CR-176715] p 466 N86-23321
Dynamic assertion testing of flight control software
[NASA-CR-176712] p 466 N86-23322
A methodology for testing fault-tolerant software
[NASA-CR-176713] p 466 N86-23323
Dynamic assertion testing of flight control software
[NASA-CR-176716] p 468 N86-23325

**ANDREYEV, I.**
Details of new Ka-126 helicopter p 435 N86-22569

**APPLIN, Z. T.**
Low-speed stability and control characteristics of a transport model with aft-fuselage-mounted advanced turboprops
[NASA-TP-2535] p 445 N86-22580

**ARBITER, D.**
Aerodynamic characteristics of a supersonic fighter aircraft model at Mach 0.40 to 2.47
[NASA-TP-2580] p 416 N86-23561

**ARNDT, S.**
Evaluation of the crash environment and injury-causing hazards in U.S. Navy helicopters p 419 A86-32070

**ASGHAR-HESSARI-DINYAVARI, M.**
Unsteady aerodynamics in time and frequency domains for finite-time arbitrary motion of helicopter rotor blades in hover and forward flight p 414 N86-22548

**ATKINSON, D. E.**
Instrumentation system for real time navigation system performance assessment
[AIAA PAPER 86-9731] p 422 A86-32078

**ATTWOOLL, V. W.**
The economics of the North Atlantic air traffic system
p 419 A86-31324

## B

**BAILLIE, I. J.**
Single heading climbs - An alternate technique for determining performance
[AIAA PAPER 86-9757] p 429 A86-32098

**BALABASKARAN, V.**
Experimental and theoretical study of wings with blunt trailing edges p 410 A86-32789

**BARBIER, P.**
Holography: The nondestructive testing of composite structures p 458 N86-22611

**BARE, E. A.**
Aerodynamic characteristics of a supersonic fighter aircraft model at Mach 0.40 to 2.47
[NASA-TP-2580] p 416 N86-23561

**BASS, M. D.**
First use of Ada in flight-critical avionics
[AIAA PAPER 86-9822] p 443 A86-32146

**BATINA, J. T.**
Unsteady transonic flow calculations for two-dimensional canard-wing configurations
p 410 A86-32780

**BATTERSON, J. G.**
Aerodynamic parameters estimated from flight and wind tunnel data p 410 A86-32782

**BEELER, G. B.**
Turbulent boundary-layer wall pressure fluctuations downstream of a tandem LEBU p 457 A86-32984

**BEITEL, G. R.**
A new rain/ice test capability to simulate flight
[AIAA PAPER 86-9824] p 432 A86-32147

**BEKEBREDE, G.**
Aircraft noise - Different ways to monitor the noise load p 467 A86-31959

**BENITEZ, R.**
Restrictions on the dispositions of navigation aids
p 422 A86-31009

**BENITO, A.**
Acoustical design economic tradeoff for transport aircraft p 468 A86-32783

**BENNETT, R. M.**
Calculation of transonic steady and oscillatory pressures on a low aspect ratio model and comparison with experiment p 412 A86-33227

**BERGENSTOFF, T.**
A radar analysis program for evaluating and monitoring primary and secondary radar systems
p 423 A86-32601

**BERGER, J. H.**
Wind tunnel tests of rotor blade sections with replications of ice formations accreted in hover
[NASA-CR-175089] p 420 N86-22558

**BERINGER, D. B.**
A peripheral integrated system status display - Figural goodness or proximity effects? p 453 A86-29870

**BERKOVITS, A.**
Fatigue behaviour of advanced aluminium alloy lugs of 7475-T761 with and without initial cracks
p 450 A86-30030

**BERMAN, J. H.**
Anisotropic wing aeroelastic theories with warping effects p 434 A86-33261

**BERNS, H. J.**
Aeroelastic problems and structural design of a tailless CFC-sailplane p 434 A86-33264

**BEUCK, G.**
Windtunnel test and laboratory simulation of a load alleviation system for a modern transport aircraft
p 445 A86-33252

**BIDDLE, A. P.**
An integrated development facility for the calibration of low-energy charged particle flight instrumentation
[NASA-TM-86526] p 458 N86-22914

**BIEZAD, D. J.**
Performance characteristics of transponder-aided versus GPS-aided inertial navigation systems
[AIAA PAPER 86-9817] p 422 A86-32142

**BINFORD, R. S.**
Instrumentation of a light twin aircraft for flow energizer flight tests
[AIAA PAPER 86-9759] p 438 A86-32099

**BIVENS, C. C.**
Directional handling qualities requirements for nap-of-the-earth tasks p 442 A86-30499

**BLAIR, A. B., JR.**
Supersonic axial-force characteristics of a rectangular-box cavity with various length-to-depth ratios in a flat plate
[NASA-TM-87659] p 415 N86-22554

**BLAIR, J.**
The US Army's LHX (light helicopter family) program
[AD-A161949] p 437 N86-23591

**BLUESTEIN, H. B.**
Analysis of airborne Doppler lidar, Doppler radar and tall tower measurements of atmospheric flows in quiescent and stormy weather
[NASA-CR-3960] p 462 N86-23159

**BOBRONNIKOV, V. T.**
Statistical dynamics and control optimization of flight vehicles p 449 A86-33299

**BOCHKAREV, A. F.**
The aeromechanics of aircraft: Flight dynamics (2nd revised and enlarged edition) p 442 A86-30925

**BOHNE, A. R.**
Storm precipitation and wind structure during aircraft strike lightning events
[AD-A162338] p 463 N86-24100

**BOPPE, C. W.**
Computation of prop-fan engine installation aerodynamics p 410 A86-32781

**BOS, H. J.**
Optimum supersonic wings with subsonic leading edges p 410 A86-32785

**BOSSI, J. A.**
Wind shear estimation by frequency-shaped optimal estimator p 464 A86-31656

**BOSWORTH, J. T.**
Real-time open-loop frequency response analysis of flight test data
[AIAA PAPER 86-9738] p 443 A86-32084

**BOWERS, D. L.**
Throttle dependent forces: A primer
[AD-A162939] p 442 N86-23599

**BOWKER, A. J.**
Recent improvements to the NAE 5 ft. x 5 ft. blowdown wind tunnel
[AD-A162034] p 449 N86-23608
**BRADSHAW, P.**
Vortex boundary-layer interactions
[NASA-CR-176701] p 415 N86-22556
**BRAUSCH, J. F.**
Free jet feasibility study of a thermal acoustic shield concept for AST/VCE application-dual flow. Comprehensive data report. Volume 1: Test nozzles and acoustic data
[NASA-CR-174817] p 469 N86-23371
Free-jet feasibility study of a thermal acoustic shield concept for AST/VCE application-dual stream nozzles. Comprehensive data report. Volume 2: Laser velocimeter and suppressor. Base pressure data
[NASA-CR-174818] p 469 N86-23372
**BRETZ, P. E.**
Spectrum fatigue crack growth behavior of aluminum alloys p 450 A86-30006
**BROCK, M. P.**
X-29A flight flutter data analysis by advanced methods
[AIAA PAPER 86-9737] p 429 A86-32083
**BROUSSARD, J. R.**
Extensions to PIFCGT: Multirate output feedback and optimal disturbance suppression
[NASA-CR-3968] p 446 N86-22581
**BROWN, D.**
Recent improvements to the NAE 5 ft. x 5 ft. blowdown wind tunnel
[AD-A162034] p 449 N86-23608
**BROWN, P. W.**
In-flight flow visualization of F-106B leading-edge vortex using the vapor-screen technique
[AIAA PAPER 86-9785] p 431 A86-32118
Development of spin resistance criteria for light general aviation airplanes
[AIAA PAPER 86-9812] p 443 A86-32139
**BRUCE, R. A.**
In-flight flow visualization of F-106B leading-edge vortex using the vapor-screen technique
[AIAA PAPER 86-9785] p 431 A86-32118
**BU, S.**
Improved Y-7, Y-12 aircraft described

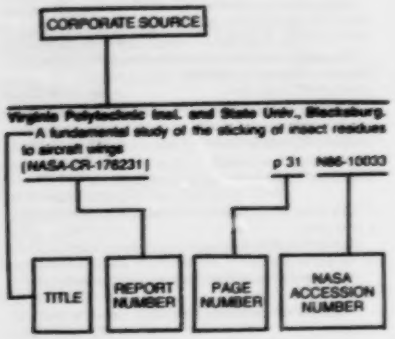
# CORPORATE SOURCE INDEX

**AERONAUTICAL ENGINEERING** / *A Continuing Bibliography (Supplement 203)*

AUGUST 1986

### Typical Corporate Source Index Listing



CORPORATE SOURCE
Virginia Polytechnic Inst. and State Univ., Blacksburg.
A fundamental study of the sticking of insect residues to aircraft wings
[NASA-CR-176231]
p 31
N86-10000
TITLE
REPORT NUMBER
PAGE NUMBER
NASA ACCESSION NUMBER

**Listings in this index are arranged alphabetically by corporate source. The title of the document is used to provide a brief description of the subject matter. The page number and the accession number are included in each entry to assist the user in locating the abstract in the abstract section. If applicable, a report number is also included as an aid in identifying the document.**

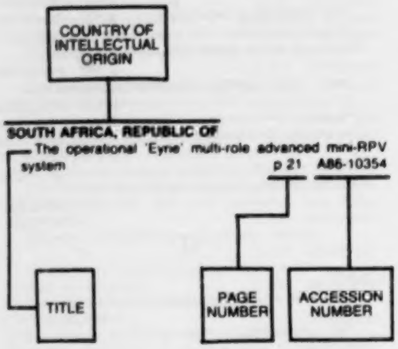
# FOREIGN TECHNOLOGY INDEX

**AERONAUTICAL ENGINEERING** / *A Continuing Bibliography (Supplement 203)* AUGUST 1986

### Typical Foreign Technology Index Listing



COUNTRY OF INTELLECTUAL ORIGIN
SOUTH AFRICA, REPUBLIC OF
The operational 'Eyrie' multi-role advanced mini-RPV system
p 21
A86-10354
TITLE
PAGE NUMBER
ACCESSION NUMBER

Listings in this index are arranged alphabetically by country of intellectual origin. The title of the document is used to provide a brief description of the subject matter. The page number and the accession number are included in each entry to assist the user in locating the citation in the abstract section.

## A

**AUSTRALIA**

Probabilistic fatigue and fracture design p 453 A86-29961

The Australian implementation of AMDAR/ACARS and the use of derived equivalent gust velocity as a turbulence indicator [AR-004-51] p 420 N86-22560

## B

**BELGIUM**

Dynamic analysis of structures with flexible rotors p 441 A86-33266

Steady transonic flow p 413 A86-33408

## C

**CANADA**

A weak beam transmission electron microscopy study of a fatigue crack tip in a 2024 aluminum alloy p 450 A86-30033

Helicopter maintenance in the real world p 405 A86-30549

Transient motion of a hypersonic wedge, including time history effects p 443 A86-31662

Step relaxation method for modal test implemented with frequency-domain preprocessing p 457 A86-32975

A discrete adaptive observer for a multi-output aircraft control system p 444 A86-33180

Random-choice-method solutions for two-dimensional planar and axisymmetric steady supersonic flows [UTIAS-297] p 415 N86-22555

Recent improvements to the NAE 5 ft. x 5 ft. blowdown wind tunnel [AD-A162034] p 449 N86-23608

**CHINA, PEOPLE'S REPUBLIC OF**

A method for computer aided design of transonic turbine cascade p 409 A86-30734

Modelling an axial flow compressor in starting of a turbojet engine p 440 A86-30737

Experimental investigation on frequency response of a turbojet engine to turbulence-type dynamic distortion p 440 A86-30740

Calculation of recirculating flow behind flame-holders p 454 A86-30743

Investigation of vortex patterns on slender bodies at high angles of attack p 410 A86-32784

Airfoil design at sonic velocity p 411 A86-32989

An improvement to the numerical method for calculations of aircraft configuration longitudinal aerodynamic characteristics p 411 A86-32994

A numerical analysis for vertical gust field induced by gust generator p 432 A86-33237

Experimental transonic pressure distributions of a flexible wing-aileron model and comparisons with results of several theoretical methods p 432 A86-33239

Calculation of the load distribution, aerodynamic derivatives and dynamic characteristics of quasi-static elastic aircraft p 413 A86-33240

Control law synthesis for gust load alleviation using linear quadratic Gaussian theory p 445 A86-33253

Determination of natural vibration properties of a wing with winglet by experimental mode synthesis technique p 435 A86-33280

Numerical modeling of transonic flows over airfoils and cascades p 414 A86-33409

China report: Science and technology [JPRS-CST-86-007] p 435 N86-22570

Improved Y-7, Y-12 aircraft described p 436 N86-22572

Details of Y-121 STOL aircraft presented p 436 N86-22573

China report: Science and technology [JPRS-CST-86-004] p 458 N86-22735

Statue of aircraft engine research at NPU reviewed p 441 N86-22736

Shanghai's outdoor aeroengine test facility detailed p 448 N86-22737

Fuzzy inference system to diagnose aircraft hydraulic faults p 407 N86-22775

Acta Aerodynamica Sinica (selected articles) [AD-A162993] p 417 N86-23575

**CZECHOSLOVAKIA**

Short crack development in mechanical structures p 453 A86-30027

Fractographic study of fatigue crack kinetics in bodies and structures p 454 A86-30034

Short crack problems in gas turbine disks p 440 A86-30093

## D

**DENMARK**

Noise emission from jet aircraft during take-off roll with respect to noise exposure calculations p 467 A86-31957

A radar analysis program for evaluating and monitoring primary and secondary radar systems p 423 A86-32601

## F

**FRANCE**

Fast motion simulation p 454 A86-30359

Coming up - The 330 and 340 p 426 A86-31221

Unsteady stall modelling in three-dimensional flow p 409 A86-32154

Shape optimization of axisymmetric structures p 458 A86-33453

Robustness of discrete-time dynamical systems: Application to the multivariable digital control of combat aircraft [ESA-TT-906] p 446 N86-22583

Holography: The nondestructive testing of composite structures p 458 N86-22611

New space paints p 451 N86-22621

La Recherche Aerospatiale, bimonthly bulletin, number 1985-1, 224/January-February [ESA-TT-915] p 458 N86-22729

## G

**GERMANY,FEDERAL REPUBLIC OF**

Flight test of a velocity augmented strapdown navigation system LHN-81 p 421 A86-30314

Periodic control for minimum-fuel aircraft trajectories p 427 A86-31657

Inter-noise 85; Proceedings of the Fourteenth International Conference on Noise Control Engineering, Munich, West Germany, September 18-20, 1985. Volumes 1 & 2 p 467 A86-31954

Noise of military aircraft in the range of airports and at low level flights p 468 A86-31961

Comparison of different aircraft noise exposure indicus in flight corridors near airports p 468 A86-31964

The German-Dutch wind tunnel - An aeroacoustics experimentator's dream p 468 A86-31965

New research aircraft for DFVLR p 428 A86-32074

The IA 63 trainer p 428 A86-32075

Flight path measurement of helicopters using a strap-down navigation system [AIAA PAPER 86-9733] p 422 A86-32080

The MBB flight test centre and its facilities [AIAA PAPER 86-9746] p 447 A86-32090

Flight test techniques used for carriage load measurements at large underfuselage store configurations on Tornado combat A/C [AIAA PAPER 86-9755] p 429 A86-32096

Investigation of main landing gear tire temperatures during taxy-out at heavy take-off masses [AIAA PAPER 86-9778] p 430 A86-32113

Tornado avionic flight testing [AIAA PAPER 86-9805] p 431 A86-32134

Detectability of low flying targets in real terrain using a diffraction model p 457 A86-32605

New CFAR-processor based on an ordered statistic p 457 A86-32618

Experimental analysis of a pitot-type air intake p 410 A86-32777

Interaction between controlling, planning, and fault managing in complex man-machine systems p 463 A86-33184

International Symposium on Aeroelasticity and Structural Dynamics, 2nd, Rheinisch-Westfaelische Technische Hochschule, Aachen, West Germany, April 1-3, 1985, Collected Papers [DGLR BERICHT 85-02] p 406 A86-33226

Calculation of 3-d unsteady transonic potential flows by a field panel method p 412 A86-33229

Application of transonic unsteady methods for calculation of flutter airloads p 412 A86-33230

Steady and unsteady pressure distributions on various profiles in separated subsonic and transonic flow p 413 A86-33233

An improved potential gradient method for the calculation of unsteady aerodynamic pressures on oscillating wings in supersonic flow p 413 A86-33234

Application of unsteady wing collocation methods to cascades in subsonic flow p 413 A86-33236

Windtunnel test and laboratory simulation of a load alleviation system for a modern transport aircraft p 445 A86-33252

Variation of anisotropic behaviour in structural optimization p 434 A86-33258

Effects of anisotropic design on the static aeroelasticity of a swept wing p 434 A86-33263

Aeroelastic problems and structural design of a tailless CFC-sailplane p 434 A86-33264

Simulation of aircraft taxi testing on the AGILE shaker test facility p 448 A86-33265

Structural dynamic aspects of rotor nodal isolation p 434 A86-33267

International Helicopter Forum, 15th and International Aerospace Exhibition, Hanover, West Germany, May 20-27, 1984, Reports p 407 A86-33300

Investigations in the flow field of airfoils with various geometries in the domain of high angles of attack. Experimental investigations
[REPT-A-13/85] p 418 N86-23576

Results of the technical investigation of accidents during the operation of German aircraft at home and abroad, and of foreign aircraft in Germany p 420 N86-23578

Standardized fatigue loading sequences for helicopter rotors (Helix and Felix). Part 1: Background and fatigue evaluation. Part 2: Final definition of Helix and Felix
[LBF-FB-167] p 436 N86-23585

Comparison of aluminum alloys concerning strength and damage tolerance
[MBB-UT-111/85] p 452 N86-23714

Activities report in aerospace in West Germany
[ISSN-0070-3966] p 471 N86-24592

## H

**HONG KONG**

Chinese space and aviation industries score major breakthroughs
[NASA-TM-87973] p 459 N86-23749

## I

**INDIA**

Unified approach for modelling fatigue crack growth and some observations on behaviour under flight simulation loading p 453 A86-29954

Fatigue crack propagation from an inclined crack under combined mode loading p 450 A86-30013

Variation of effective stress range ratio under simple variable amplitude loading p 453 A86-30014

Fatigue crack growth in patched plates under constant amplitude and flight simulation loadings p 454 A86-30092

Investigation of an aircraft accident by fractographic analysis p 418 A86-30097

Frequency-domain application of Gauss-Newton method to extract aircraft longitudinal parameters p 442 A86-31125

Free vibration characteristics of periodically stiffened panels with damped stringers p 456 A86-31773

Parameters of a dedicated weather radar for terminal air navigation, traffic control and safety p 423 A86-32616

Computationally simple adaptive tracking filters based on weighted averages p 457 A86-32642

Experimental and theoretical study of wings with blunt trailing edges p 410 A86-32789

**ISRAEL**

Fatigue behaviour of advanced aluminium alloy lugs of 7475-T761 with and without initial cracks p 450 A86-30030

On the exact solution of the linearized lifting-surface problem of an elliptic wing p 409 A86-31132

An exact formulation of the unsteady aerodynamic theory of lifting surfaces undergoing arbitrary small motions in a supersonic flow field p 413 A86-33235

Static aeroelastic analysis using aircraft vibration modes p 432 A86-33241

Rapid vibration mode analysis of aircraft with external stores p 435 A86-33281

**ITALY**

Multiradar tracking in the new ATC system at Mazatlan (Mexico) area control center p 424 A86-32640

Rivista Technica Selenia, volume 9, number 3, 1985 p 407 N86-22537

The MRCA automatic test system p 407 N86-22538

Complex systems integrated logistic support: Automatic Test Equipment (ATE) and test oriented languages role p 407 N86-22539

Selenia's contribution to the development of systems support: Microwave Automatic Test Equipment (ATE) p 407 N86-22540

Implicit activities in the post development phase p 407 N86-22542

Lines of evolution p 407 N86-22543

Activities report of the Department of Aerospace Engineering p 470 N86-23491

## J

**JAPAN**

Recombination of vortex filaments and its role in aerodynamic noise p 408 A86-30213

A correction of the angle of incidence for a two-dimensional wing model in the closed test section p 409 A86-31020

Improved numerical method for lifting airfoils with oscillating control surfaces in subsonic flow p 409 A86-31021

Outer surface of airplane and computational grid for flow analysis in physical space p 409 A86-31022

An interpretation of airplane general motion and contol as inverse problem p 443 A86-31661

What should be known on the environmental impact assessment for a planning airport p 462 A86-31962

Development and flight testing of the T-2 control configured vehicle
[AIAA PAPER 86-9763] p 429 A86-32101

On the development of equiobservable forms with application to adaptive control p 465 A86-33134

Adaptive flight control of unstable helicopters during transition p 444 A86-33178

Numerical analysis of inviscid flows About wing-fuselage combinations. Part 1: Development of grid generation code YOKUDO-G
[NAL-TR-864] p 414 N86-22551

Japan report: Science and technology
[JPRS-JST-86-007] p 460 N86-23773

Rollout of XT-4 intermediate class training aircraft p 438 N86-23774

Numerical simulation of vortices shed behind a rotating wing p 418 N86-23862

## N

**NETHERLANDS**

Aircraft noise - Different ways to monitor the noise load p 467 A86-31959

RASP - A system generating very accurate position markers during flight testing
[AIAA PAPER 86-9802] p 422 A86-32131

Optimum supersonic wings with subsonic leading edges p 410 A86-32785

Minimax frequency domain optimization of multivariable linear feedback systems p 465 A86-33127

NLR experience in the application of active flutter suppression and gust load alleviation, applied to a wind-tunnel model p 444 A86-33250

Comparative evaluation of redundant flight data recorded by a Digital Airborne Integrated Data System Recorder (DAR) on board an Airbus A-310 aircraft p 439 N86-22575

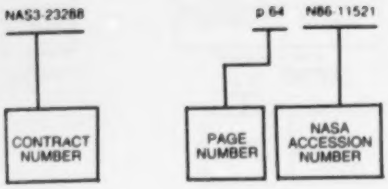
# CONTRACT NUMBER INDEX

## Typical Contract Number Index Listing



Listings in this index are arranged alphanumerically by contract number. Under each contract number, the accession numbers denoting documents that have been produced as a result of research done under that contract are arranged in ascending order with the AIAA accession numbers appearing first. The accession number denotes the number by which the citation is identified in the abstract section. Preceding the accession number is the page number on which the citation may be found.

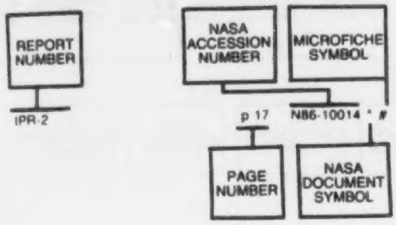
# REPORT NUMBER INDEX

**AERONAUTICAL ENGINEERING** / *A Continuing Bibliography (Supplement 203)*

AUGUST 1986

### Typical Report Number Index Listing



Listings in this index are arranged alphanumerically by report number. The page number indicates the page on which the citation is located. The accession number denotes the number by which the citation is identified. An asterisk (*) indicates that the item is a NASA report. A pound sign (#) indicates that the item is available on microfiche.

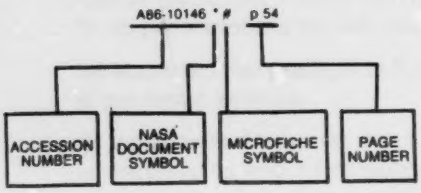
# ACCESSION NUMBER INDEX

**AERONAUTICAL ENGINEERING** / *A Continuing Bibliography (Supplement 203)*

AUGUST 1986

### Typical Accession Number Index Listing



Listings in this index are arranged alphanumerically by accession number. The page number listed to the right indicates the page on which the citation is located. An asterisk (*) indicates that the item is a NASA report. A pound sign (#) indicates that the item is available on microfiche.

# AVAILABILITY OF CITED PUBLICATIONS

## IAA ENTRIES (A86-10000 Series)

Publications announced in *IAA* are available from the AIAA Technical Information Service as follows: Paper copies of accessions are available at $10.00 per document (up to 50 pages), additional pages $0.25 each. Microfiche(1) of documents announced in *IAA* are available at the rate of $4.00 per microfiche on demand. Standing order microfiche are available at the rate of $1.45 per microfiche for *IAA* source documents and $1.75 per microfiche for AIAA meeting papers.

Minimum air-mail postage to foreign countries is $2.50. All foreign orders are shipped on payment of pro-forma invoices.

All inquiries and requests should be addressed to: Technical Information Service, American Institute of Aeronautics and Astronautics, 555 West 57th Street, New York, NY 10019. Please refer to the accession number when requesting publications.

## STAR ENTRIES (N86-10000 Series)

One or more sources from which a document announced in *STAR* is available to the public is ordinarily given on the last line of the citation. The most commonly indicated sources and their acronyms or abbreviations are listed below. If the publication is available from a source other than those listed, the publisher and his address will be displayed on the availability line or in combination with the corporate source line.

Avail: NTIS. Sold by the National Technical Information Service. Prices for hard copy (HC) and microfiche (MF) are indicated by a price code preceded by the letters HC or MF in the *STAR* citation. Current values for the price codes are given in the tables on NTIS PRICE SCHEDULES.

Documents on microfiche are designated by a pound sign (#) following the accession number. The pound sign is used without regard to the source or quality of the microfiche.

Initially distributed microfiche under the NTIS SRIM (Selected Research in Microfiche) is available at greatly reduced unit prices. For this service and for information concerning subscription to NASA printed reports, consult the NTIS Subscription Section, Springfield, Va. 22161.

NOTE ON ORDERING DOCUMENTS: When ordering NASA publications (those followed by the * symbol), use the N accession number. NASA patent applications (only the specifications are offered) should be ordered by the US-Patent-Appl-SN number. Non-NASA publications (no asterisk) should be ordered by the AD, PB, or other *report* number shown on the last line of the citation, not by the N accession number. It is also advisable to cite the title and other bibliographic identification.

Avail: SOD (or GPO). Sold by the Superintendent of Documents, U.S. Government Printing Office, in hard copy. The current price and order number are given following the availability line. (NTIS will fill microfiche requests, as indicated above, for those documents identified by a # symbol.)

Avail: NASA Public Document Rooms. Documents so indicated may be examined at or purchased from the National Aeronautics and Space Administration, Public Document Room (Room 126), 600 Independence Ave., S.W., Washington, D.C. 20546, or public document rooms located at each of the NASA research centers, the NASA Space Technology Laboratories, and the NASA Pasadena Office at the Jet Propulsion Laboratory.

---

(1) A microfiche is a transparent sheet of film, 105 by 148 mm in size containing as many as 60 to 98 pages of information reduced to micro images (not to exceed 26.1 reduction).

Avail: DOE Depository Libraries. Organizations in U.S. cities and abroad that maintain collections of Department of Energy reports, usually in microfiche form, are listed in *Energy Research Abstracts*. Services available from the DOE and its depositories are described in a booklet, *DOE Technical Information Center - Its Functions and Services* (TID-4660), which may be obtained without charge from the DOE Technical Information Center.

Avail: Univ. Microfilms. Documents so indicated are dissertations selected from *Dissertation Abstracts* and are sold by University Microfilms as xerographic copy (HC) and microfilm. All requests should cite the author and the Order Number as they appear in the citation.

Avail: USGS. Originals of many reports from the U.S. Geological Survey, which may contain color illustrations, or otherwise may not have the quality of illustrations preserved in the microfiche or facsimile reproduction, may be examined by the public at the libraries of the USGS field offices whose addresses are listed in this introduction. The libraries may be queried concerning the availability of specific documents and the possible utilization of local copying services, such as color reproduction.

Avail: HMSO. Publications of Her Majesty's Stationery Office are sold in the U.S. by Pendragon House, Inc. (PHI), Redwood City, California. The U.S. price (including a service and mailing charge) is given, or a conversion table may be obtained from PHI.

Avail: BLL (formerly NLL): British Library Lending Division, Boston Spa, Wetherby, Yorkshire, England. Photocopies available from this organization at the price shown. (If none is given, inquiry should be addressed to the BLL.)

Avail: Fachinformationszentrum, Karlsruhe. Sold by the Fachinformationszentrum Energie, Physik, Mathematik GMBH, Eggenstein Leopoldshafen, Federal Republic of Germany, at the price shown in deutschmarks (DM).

Avail: Issuing Activity, or Corporate Author, or no indication of availability. Inquiries as to the availability of these documents should be addressed to the organization shown in the citation as the corporate author of the document.

Avail: U.S. Patent and Trademark Office. Sold by Commissioner of Patents and Trademarks, U.S. Patent and Trademark Office, at the standard price of $1.50 each, postage free.

Avail: ESDU. Pricing information on specific data, computer programs, and details on ESDU topic categories can be obtained from ESDU International Ltd. Requesters in North America should use the Virginia address while all other requesters should use the London address.

Other availabilities: If the publication is available from a source other than the above, the publisher and his address will be displayed entirely on the availability line or in combination with the corporate author line.

## GENERAL AVAILABILITY

All publications abstracted in this bibliography are available to the public through the sources as indicated in the *STAR Entries* and *IAA Entries* sections. It is suggested that the bibliography user contact his own library or other local libraries prior to ordering any publication inasmuch as many of the documents have been widely distributed by the issuing agencies, especially NASA.

## PUBLIC COLLECTIONS OF NASA DOCUMENTS

**DOMESTIC:** NASA and NASA-sponsored documents and a large number of aerospace publications are available to the public for reference purposes at the library maintained by the American Institute of Aeronautics and Astronautics, Technical Information Service, 555 West 57th Street, 12th Floor, New York, New York 10019.

**EUROPEAN:** An extensive collection of NASA and NASA-sponsored publications is maintained by the British Library Lending Division, Boston Spa, Wetherby, Yorkshire, England for public access. The British Library Lending Division also has available many of the non-NASA publications cited in *STAR*. European requesters may purchase facsimile copy or microfiche of NASA and NASA-sponsored documents, those identified by both the symbols # and * from ESA — Information Retrieval Service European Space Agency, 8-10 rue Mario-Nikis, 75738 CEDEX 15, France.

## FEDERAL DEPOSITORY LIBRARY PROGRAM

In order to provide the general public with greater access to U.S. Government publications, Congress established the Federal Depository Library Program under the Government Printing Office (GPO), with 50 regional depositories responsible for permanent retention of material, inter-library loan, and reference services. At least one copy of nearly every NASA and NASA-sponsored publication, either in printed or microfiche format, is received and retained by the 50 regional depositories. A list of the regional GPO libraries, arranged alphabetically by state, appears on the inside back cover. These libraries are *not* sales outlets. A local library can contact a Regional Depository to help locate specific reports, or direct contact may be made by an individual.

## STANDING ORDER SUBSCRIPTIONS

NASA SP-7037 and its supplements are available from the National Technical Information Service (NTIS) on standing order subscription as PB 86-914100 at the price of $7.00 domestic and $14.00 foreign—includes annual index. Standing order subscriptions do not terminate at the end of a year, as do regular subscriptions, but continue indefinitely unless specifically terminated by the subscriber.

# FEDERAL DEPOSITORY LIBRARY PROGRAM

The Federal Depository Library Program provides Government publications to designated libraries throughout the United States. The Regional Depository Libraries listed below receive and retain at least one copy of nearly every Federal Government publication, either in printed or microfilm form, for use by the general public. These libraries provide reference services and inter-library loans; however, they are *not* sales outlets. You may wish to ask your local library to contact a Regional Depository to help you locate specific publications, or you may contact the Regional Depository yourself.

# INTRODUCTION

This issue of *Aeronautical Engineering -- A Continuing Bibliography* (NASA SP-7037) lists 419 reports, journal articles, and other documents originally announced in August 1986 in *Scientific and Technical Aerospace Reports (STAR)* or in *International Aerospace Abstracts (IAA)*.

The coverage includes documents on the engineering and theoretical aspects of design, construction, evaluation, testing, operation, and performance of aircraft (including aircraft engines) and associated components, equipment, and systems. It also includes research and development in aerodynamics, aeronautics, and ground support equipment for aeronautical vehicles.

Each entry in the bibliography consists of a standard bibliographic citation accompanied in most cases by an abstract. The listing of the entries is arranged by the first nine *STAR* specific categories and the remaining *STAR* major categories. This arrangement offers the user the most advantageous breakdown for individual objectives. The citations include the original accession numbers from the respective announcement journals. The *IAA* items will precede the *STAR* items within each category.

Seven indexes -- subject, personal author, corporate source, foreign technology, contract number, report number, and accession number -- are included.

An annual cumulative index will be published.

# TABLE OF CONTENTS

Page

**Category 01 Aeronautics (General)** 473

**Category 02 Aerodynamics** 474
Includes aerodynamics of bodies, combinations, wings, rotors, and control surfaces; and internal flow in ducts and turbomachinery.

**Category 03 Air Transportation and Safety** 481
Includes passenger and cargo air transport operations; and aircraft accidents.

**Category 04 Aircraft Communications and Navigation** 484
Includes digital and voice communication with aircraft; air navigation systems (satellite and ground based); and air traffic control.

**Category 05 Aircraft Design, Testing and Performance** 486
Includes aircraft simulation technology.

**Category 06 Aircraft Instrumentation** 498
Includes cockpit and cabin display devices; and flight instruments.

**Category 07 Aircraft Propulsion and Power** 500
Includes prime propulsion systems and systems components, e.g., gas turbine engines and compressors; and on-board auxiliary power plants for aircraft.

**Category 08 Aircraft Stability and Control** 507
Includes aircraft handling qualities; piloting; flight controls; and autopilots.

**Category 09 Research and Support Facilities (Air)** 513
Includes airports, hangars and runways; aircraft repair and overhaul facilities; wind tunnels; shock tube facilities; and engine test blocks.

**Category 10 Astronautics** 514
Includes astronautics (general); astrodynamics; ground support systems and facilities (space); launch vehicles and space vehicles; space transportation; spacecraft communications, command and tracking; spacecraft design, testing and performance; spacecraft instrumentation; and spacecraft propulsion and power.

**Category 11 Chemistry and Materials** 515
Includes chemistry and materials (general); composite materials; inorganic and physical chemistry; metallic materials; nonmetallic materials; and propellants and fuels.

**Category 12 Engineering** 519
Includes engineering (general); communications; electronics and electrical engineering; fluid mechanics and heat transfer; instrumentation and photography; lasers and masers; mechanical engineering; quality assurance and reliability; and structural mechanics.

**Category 13 Geosciences** 528
Includes geosciences (general); earth resources; energy production and conversion; environment pollution; geophysics; meteorology and climatology; and oceanography.

**Category 14 Life Sciences** 529
Includes sciences (general); aerospace medicine; behavioral sciences; man/system technology and life support; and planetary biology.

**Category 15 Mathematics and Computer Sciences** 530
Includes mathematical and computer sciences (general); computer operations and hardware; computer programming and software; computer systems; cybernetics; numerical analysis; statistics and probability; systems analysis; and theoretical mathematics.

**Category 16 Physics** 534
Includes physics (general); acoustics; atomic and molecular physics; nuclear and high-energy physics; optics; plasma physics; solid-state physics; and thermodynamics and statistical physics.

**Category 17 Social Sciences** 536
Includes social sciences (general); administration and management; documentation and information science; economics and cost analysis; law and political science; and urban technology and transportation.

**Category 18 Space Sciences** N.A.
Includes space sciences (general); astronomy; astrophysics; lunar and planetary exploration; solar physics; and space radiation.

**Category 19 General** 537

The aircraft industry has long been concerned with the increase of drag on airplanes due to fouling of the wings by insects. The present research studied the effects of surface energy and surface roughness on the phenomenon of insect sticking. Aluminum plates of different roughnesses were coated with thin films of polymers with varying surface energies. The coated plates were attached to a custom jig and mounted on top of an automobile for insect collection. Contact angle measurements, X-ray photoelectron spectroscopy and specular reflectance infrared spectroscopy were used to characterize the surface before and after the insect impact experiments. Scanning electron microscopy showed the topography of insect residues on the exposed plates. Moments were calculated in order to find a correlation between the parameters studied and the amount of bugs collected on the plates. An effect of surface energy on the sticking of insect residues was demonstrated.

A previously developed technique for selecting a design space for efficient supersonic wings is reviewed; this design-space concept is expanded to include thickness and camber effects and is evaluated for cambered wings at high-lift conditions. The original design-space formulation was based on experimental upper-surface and lower-surface normal-force characteristics for flat, uncambered delta wings; it is shown that these general characteristics hold for various thickness distributions and for various amounts of leading-edge camber. The original design-space formulation was also based on the assumption that the combination of Mach number and leading-edge sweep which would produce an equal division of flat-wing lift between the upper and lower surface would also be the proper combination to give the best cambered-wing performance. Using drag-due-to-lift factor as a measure of performance, for high-lift conditions cambered-wing performance is shown to significantly increase as conditions approach the design space; this correlation is demonstrated for both subcritical and supercritical flows.

## AERONAUTICS (GENERAL)

**A86-35163#**

**DEVELOPMENT TRENDS IN THE CASE OF HIGH-PERFORMANCE AIRCRAFT [ENTWICKLUNGSTENDENZEN BEI HOCHLEISTUNGSFLUGZEUGEN]**

K. H. HEILMANN (Bundesministerium der Verteidigung, Bonn, West Germany) DGLR, Jahrestagung, Bonn, West Germany, Sept. 30-Oct. 2, 1985. 33 p. In German.
(DGLR PAPER 85-106)

The present paper is mainly concerned with fighter aircraft. The design of the European Fighter Aircraft (EFA) and the U.S. Advanced Tactical Fighter (ATF) represents an initiation of fighter aircraft projects which are particularly suited for providing an illustration of the developments in the considered area. In a discussion of these development trends, relations to other types of aircraft in the civil and military sectors are also considered. The requirements which have to be satisfied to justify the initiation of a program for the development of a fighter are examined. Attention is given to new operational capabilities provided by new technologies, new tactics, the feasibility of combat against airborne targets at a distance of 70 km under all-weather conditions, requirements regarding an employment of additional technological advances, developments regarding flight mechanics and flight control, the continuation of a utilization of both fiber-reinforced and metallic materials, the characteristics of the engines of the future, advances related to avionics, and general technological development trends. G.R.

**A86-35448**

**COCKPIT AND CABIN CREW COORDINATION AND COMMUNICATION**

N. KOAN (Association of Flight Attendants, Washington, DC) IN: Aerospace Behavioral Engineering Technology Conference, 4th, Long Beach, CA, October 14-17, 1985, Proceedings . Warrendale, PA, Society of Automotive Engineers, Inc., 1985, p. 189-193.
(SAE PAPER 851918)

Methods for improving cockpit/crew coordination and communication are examined. FAA recommendations and bulletins for enhancing crew interaction are described. The need for crew members to understand each others' duties, standardized emergency procedures, clarified sterile cockpit procedures, joint training of crew members, and independently powered communication equipment to ensure safe flights is discussed. I.F.

**AMERICAN HELICOPTER SOCIETY, ANNUAL FORUM, 41ST, FORT WORTH, TX, MAY 15-17, 1985, PROCEEDINGS**

Alexandria, VA, American Helicopter Society, 1985, 881 p. For individual items see A86-35602 to A86-35615, A86-35617 to A86-35665.

The present conference considers topics in the fields of helicopter dynamics, avionics, propulsion systems, acoustics, handling qualities, helicopter design configurations and aerodynamics, helicopter airframe structures and materials, helicopter manufacturers' product support services, test and evaluation techniques, helicopter rotor icing phenomena and deicing methods, manufacturing and product assurance methods, and helicopter crashworthiness. Attention is given to tilt-rotor aircraft stability test results, hover performance and crashworthiness, hingeless rotor gust response and stability, X-wing helicopter performance potential in naval applications, the aerodynamics of circulation control rotors, robotics in helicopter manufacturing, and composite structural damage assessment methods. O.C.

**FLIGHT SIMULATION/SIMULATORS; PROCEEDINGS OF THE AEROSPACE TECHNOLOGY CONFERENCE AND EXPOSITION, LONG BEACH, CA, OCTOBER 14-17, 1985**

Congress and Exposition sponsored by SAE. Warrendale, PA, Society of Automotive Engineers, Inc. (SAE SP-634), 1985, 81 p. For individual items see A86-36940 to A86-36947.
(SAE SP-634)

The conference presents papers on the role of flight simulation in helicopter crew station design, changes in engineering flight simulation, and the application of the optimal control model to the design of flight simulation experiments. Also considered are the capabilities of airborne and ground-based flight simulation, alternatives to the high cost and the long time associated with typical flight simulation efforts, and the impact of Ada on simulators. Additional papers cover the simulation of aircraft components for training purposes and the effects of visual-cue dominance hierarchies on simulator design. K.K.

**A86-34160**

**THE INDUCED DOWNWASH AND LIFT ON A WING OF HIGH ASPECT RATIO IN UNSTEADY MOTION**

P. WILMOTT (Oxford University, England) Aeronautical Journal (ISSN 0001-9240), vol. 90, Feb. 1986, p. 63-72. Research supported by the Admirality Research Establishment. refs

An unsteady lifting line theory for a general motion of a wing of high aspect ratio is presented. The analysis parallels that of Van Dyke (1964) in his solution for the steady lifting line by the method of matched asymptotic expansions but is complicated by the shedding of transverse vortices associated with variation of circulation with time. Expressions are found for the downwash due to three-dimensional (finite span) effects and the lift on the wing. Calculation are presented for a wing of elliptic planform following a curved path. Author

**A86-34411#**

**INTRABLADE VELOCITY MAPPING IN TRANSONIC FAN PASSAGES OF GAS TURBINE**

M. C. WILLIAMS (United Technologies Corp., Pratt and Whitney Group, East Hartford, CT) IN: International Symposium on Laser Anemometry, 2nd, Miami Beach, FL, November 17-22, 1985, Proceedings . New York, American Society of Mechanical Engineers, 1985, p. 19-26. refs

Characterization of the aerodynamics of the flows within gas turbine intrablade passages requires the development of sensitive laser Doppler velocimeters, data acquisition systems capable of efficiently and accurately handling substantial quantities of data, and appropriate methods of post test data analysis and display to maximize the value of the recorded data. Pratt and Whitney developed a confocal LDV which was first employed in the mid 1970's for gas turbine intrablade studies. Experience gained through the instrument's use in several programs coupled with recent advances in optical coating technology formed the basis for a redesign which has recently been completed. The performance of this refined instrument has been demonstrated in a NASA sponsored fan study in which approximately 200 million valid velocity signals were detected and recorded. This study, the data acquisition system employed, and post test data reduction and presentation methods are reviewed. A novel recently developed data format which permits a three-dimensional depiction of intrablade air flows is also discussed. Author

**A86-34485**

**RISING OF THE FERRIE POINT ON THE WINDWARD SIDE OF DELTA WINGS [O VSPLYVANII TOCHKI FERRI NA NAVETRENNOI STORONE V-OBRAZNYKH KRYL'EV]**

N. A. OSTAPENKO (Moskovskii Gosudarstvennyi Universitet, Moscow, USSR) Akademiia Nauk SSSR, Doklady (ISSN 0002-3264), vol. 287, no. 2, 1986, p. 295-298. In Russian. refs

The position of the Ferrie singularity point on the windward side of a delta wing in supersonic flow (Mach 3) is examined. It is established that, depending on the flow regime, this point can be situated at the point of discontinuity of the transverse contour of the wing, or it can rise from the wing surface to the bow shock in the flow symmetry plane. Conical-flow restructuring in the presence of a Mach shock configuration is found which is connected with the fact that streamlines that have passed through an oblique/straight shock system are associated with smaller spherical losses of total pressure than streamlines that have passed through a bridge-shaped shock. B.J.

**A86-35082**

**FATIGUE LIFE IN A COUPLED PROBLEM CONCERNING THE MOTION OF A FLEXIBLE WING [USTALOSTNAIA DOLGOVECHNOST' V SVIAZANNOI ZADACHE O DVIZHENII GIBKOGO KRYLA]**

B. A. ERSHOV Leningradskii Universitet, Vestnik, Matematika, Mekhanika, Astronomiia (ISSN 0024-0850), Jan. 1986, p. 122, 123. In Russian. refs

A method is presented for calculating the fatigue life of a flexible wing moving at a supersonic velocity in a turbulent atmosphere. In accordance with the method proposed here, the fatigue life is calculated using a formula in which the following parameters must be known: the Wohler curve parameters determined experimentally, parameters of an atmospheric turbulence model, parameters characterizing the random vibrations of the flexible wing, and flow parameters in a formula for the spectral density of wing vibrations. V.L.

**A86-35154#**

**DETERMINATION OF WING DEFORMATION IN WIND TUNNEL MODELS USING STRESS MEASUREMENT SECTION TECHNOLOGY [BESTIMMUNG DER FLUEGELVERFORMUNG VON WINDKANAL-MODELLEN MIT HILFE DER DEHNGSMESSSTREIFEN-TECHNIK]**

T. WOLF (Darmstadt, Technische Hochschule, West Germany) DGLR, Jahrestagung, Bonn, West Germany, Sept. 30-Oct. 2, 1985. 19 p. In German. refs
(DGLR PAPER 85-091)

A procedure using stress measurement section technology to control elastic wing deformation in wind tunnels is described. This method permits the deformation to be determining during wind tunnel tests without exact knowledge of the load distribution. An example of the method's application is presented. C.D.

**A86-35167#**

**ANALYTIC REPRESENTATION OF STEADY AND UNSTEADY AERODYNAMIC COEFFICIENTS OF MODERN HELICOPTER ROTORS [ANALYTISCHE DARSTELLUNG DER STATIONAEREN UND INSTATIONAEREN AERODYNAMISCHEN BEIWERTE MODERNER HUBSCHRAUBERROTOREN]**

U. LEISS and S. WAGNER (Muenchen, Universitaet der Bundeswehr, Munich, West Germany) DGLR, Jahrestagung, Bonn, West Germany, Sept. 30-Oct. 2, 1985. 20 p. In German. refs
(Contract BMFT-LFF-83408)
(DGLR PAPER 85-114)

The development of modern highly stressed helicopter rotors requires an accurate knowledge of the dynamic and aerodynamic properties. Unsteady processes can be the cause for very long times of computation. With the objective to overcome these difficulties, the present investigation provides a universal model for the calculation of the aerodynamic forces and moments of a rotor blade. A modular, not too large structure, is needed for the employment of the flight-mechanics real-time simulation and for design and optimization objectives. Time-consuming computational procedures are replaced by simple theories and empirical parameters with aerodynamic significance. Attention is given to relations between forces and moments and the new dimensionless aerodynamic coefficients, steady flow, separated displacement flow, separated cyclic flow, supersonic flow, transonic flow, a comprehensive model of the steady flow, unsteady flow, a comparison of the obtained data with experimental values and other procedures, three-dimensional effects, and the analytic integration of differential forces and moments. G.R.

**A86-35171#**

### A COMPARISON OF SOLUTIONS OF THE COMPLETE POTENTIAL EQUATION AND THE EULER EQUATIONS FOR THE TRANSONIC FLOW AROUND THE DFVLR-F4-WING [VERGLEICH VON LOESUNGEN DER VOLLSTAENDIGEN POTENTIALGLEICHUNG UND DER EULERGLEICHUNGEN FUER DIE TRANSSONISCHE UMSTROEMUNG DES DFVLR-F4-FLUEGELS]

G. WICHMANN, R. RADESPIEL (DFVLR, Brunswick, West Germany), and S. LEICHER (Dornier GmbH, Friedrichshafen, West Germany) DGLR, Jahrestagung, Bonn, West Germany, Sept. 30-Oct. 2, 1985. 19 p. In German. refs
(DGLR PAPER 85-121)

In the context of the design of transonic wings for modern transport aircraft, reliable computational procedures are needed to verify design objectives and to predict performance limits. The present investigation is concerned with a study of the characteristics and suitability of currently available computational methods, taking into account an employment in the case of the DFVLER-F4-wing, which has been designed for an aircraft of the type Airbus A310. The results obtained with procedures for the study of the flow around wings are discussed and compared, giving attention to the solution of the potential equation on the basis of the finite-difference and finite-volume schemes. A time-marching approach has been used for the solution of the Euler equations. G.R.

**A86-35172#**

### A VORTEX LATTICE METHOD FOR CALCULATING NONLINEAR AERODYNAMIC CHARACTERISTICS OF INTERFERING AIRFOILS [EIN WIRBELGITTERVERFAHREN ZUR BERECHNUNG NICHTLINEARER AERODYNAMISCHER CHARAKTERISTIKA VON INTERFERIERENDEN TRAGFLAECHEN]

CH. URBAN and S. WAGNER (Muenchen, Universitaet der Bundeswehr, Munich, West Germany) DGLR, Jahrestagung, Bonn, West Germany, Sept. 30-Oct. 2, 1985. 12 p. In German. refs
(Contract DFG-WA-42413)
(DGLR PAPER 85-122)

A numerical method is presented for calculating nonlinear, steady, and unsteady interference effects in incompressible potential flow for individual and staggered airfoils with and without front and lateral edge flow separation. The velocity potential is represented by discretely distributed dipole panels of constant strength on the wings and free vortex surfaces. In addition to the kinematic boundary conditions at the flat, thin wings, the remaining boundary conditions are implicitly fulfilled using the singularity model. The problem is solved using a time-dependent, stepped procedure in which the free vortex sheets form suddenly and evolve to a stationary state. The results of the flow interferences are illustrated for individual airfoils and wing-wing configurations. C.D.

### INVISCID VORTEX-STRETCHED TURBULENT SHEAR-LAYER FLOW COMPUTED AROUND A CRANKED DELTA WING

A. RIZZI (Flygtekniska Forsoksanstalten, Bromma, Sweden) and C. J. PURCELL (ETA Systems, Inc., St. Paul, MN) Communications in Applied Numerical Methods (ISSN 0748-8025), vol. 2, Mar.-Apr. 1986, p. 139-144.

A numerical simulation technique that evaluates the inviscid, turbulent flow-field, which develops around a wing at the high Reynolds number of free-flight conditions, is described. The development of a database using the transfinite interpolation method of Eriksson (1982) to construct a boundary-conforming O-O type mesh and Euler equations to form an artificial viscosity model is examined. Simulation data demonstrating the flow for a twisted, cranked-and-cropped delta wing are discussed. I.F.

### A NEW APPROACH TO THE FREE WAKE PROBLEM FOR HOVERING ROTORS

D. B. BLISS, D. A. WACHSPRESS (Continuum Dynamics, Inc., Princeton, NJ), and T. R. QUACKENBUSH (Princeton University, NJ) IN: American Helicopter Society, Annual Forum, 41st, Fort Worth, TX, May 15-17, 1985, Proceedings . Alexandria, VA, American Helicopter Society, 1985, p. 463-477. refs
(Contract NAS2-11730)

In the present approach to the hovering rotor free wake problem, an influence coefficient solution method is used to find that rotor wake solution which is steady in a reference frame that rotates with the blades; this scheme solves directly for the conditions of free wake equilibrium by a procedure that does not involve time-stepping and the associated use of numerical damping or special convergence methods. The solution method has been implemented in a hover wake computer program having a three-part wake model for the tip vortex. All three wake regions are represented by the new Basic Curved Vortex Elements. Sample hover calculations are presented for single blade and multiblade rotors. O.C.

### APPLIED AERODYNAMICS OF CIRCULATION CONTROL AIRFOILS AND ROTORS

E. O. ROGERS, A. W. SCHWARTZ, and J. S. ABRAMSON (David W. Taylor Naval Ship Research and Development Center, Bethesda, MD) IN: American Helicopter Society, Annual Forum, 41st, Fort Worth, TX, May 15-17, 1985, Proceedings . Alexandria, VA, American Helicopter Society, 1985, p. 479-490.

For a lifting/stoppable circulation control airfoil rotor, the critical flight condition of minimum available lift occurs in the 0.85-1.10 advance ratio range. Analysis of the aerodynamic flowfield for each blade element at the critical flight condition indicates that the airfoils operate in a low speed, highly yawed environment at a negative angle-of-attack. These data furnish guidelines for the proper design of airfoils and for the assessment of their performance. Recent tests of circulation control airfoils have further defined the stall boundaries and the influence of airfoil geometry on optimal operating conditions. O.C.

### HOVERING ROTOR AIRLOAD PREDICTION USING A FULL POTENTIAL FLOW ANALYSIS WITH REALISTIC WAKE GEOMETRY

T. A. EGOLF and S. P. SPARKS (United Technologies Research Center, East Hartford, CT) IN: American Helicopter Society, Annual Forum, 41st, Fort Worth, TX, May 15-17, 1985, Proceedings . Alexandria, VA, American Helicopter Society, 1985, p. 515-530. refs
(Contract NAS2-11150)

A three-dimensional, full potential flow analysis with realistic hover wake geometry is presented for the prediction of hovering rotor airloads. The method of analysis is based on the concept of matching inner and outer domain solutions in three dimensions. The inner domain nonlinear solution is obtained using a finite difference analysis and the outer domain solution is based on prescribed wake methodology. This formulation which includes three-dimensional wake influence, was initially validated using a fixed-wing analysis, and has been extended to hovering rotor flight. Detailed chordwise and spanwise loading results are compared with subsonic and transonic test results from two rotor configurations to illustrate the predictive capabilities of the analysis. The extension of the method to steady-level forward flight is also discussed. Author

**THE AERODYNAMICS OF ROTOR BLADES WITH ICE SHAPES ACCRETED IN HOVER AND IN LEVEL FLIGHT**

J. D. LEE (Ohio State University, Columbus) and R. J. SHAW (NASA, Lewis Research Center, Cleveland, OH) IN: American Helicopter Society, Annual Forum, 41st, Fort Worth, TX, May 15-17, 1985, Proceedings . Alexandria, VA, American Helicopter Society, 1985, p. 735-742. refs

Through a series of flights in artificial clouds, ice accretions on the main rotor of a UH-1H helicopter were documented in detail upon landing by silicone-rubber molds for both hover and level flights. Full scale reproductions of typical accretions in hover were fabricated by means of epoxy castings and used for a wind-tunnel test program. Surface static pressure distributions were recorded and used to evaluate lift and pitching moment increments while drag was determined by wake surveys. For comparison, accreted ice shapes are presented for two level flight cases as well as preliminary analytical predictions. Author

**FLOW FIELD AND NEAR AND FAR SOUND FIELD OF A SUBSONIC JET**

K. B. M. Q. ZAMAN (NASA, Lewis Research Center, Cleveland, OH) Journal of Sound and Vibration (ISSN 0022-460X), vol. 106, April 8, 1986, p. 1-16. refs

Flow and sound field data are presented for a 2.54 cm diameter air jet at a Mach number of 0.50 and a Reynolds number of 300,000. Distributions of mean velocity, turbulence intensities, Reynolds stress, spectral components of turbulence as well as of the near field pressure, together with essential characteristics of the far field sound are reported. This detailed set of data for one particular flow, erstwhile unavailable in the literature, is expected to help promoote and calibrate subsonic jet noise theories. 'Source locations' in terms of the turbulence maxima, coupling between the entrainment dynamics and the near pressure field, the sound radiation paths, and the balance in mass, momentum and sound energy fluxes are discussed. The results suggest that the large scale coherent structures of the jet govern the 'source locations' by controlling the turbulence and also strongly influence the near field pressure fluctuations. **VELOCITY DISTRIBUTION AROUND A WING IN A WIND TUNNEL VERIFICATION OF A CALCULATION METHOD BY MEANS OF A LASER ANEMOMETER [ROZKLAD PREDKOSCI WOKOL PLATA UMIESZCZONEGO W TUNELU PRZEPLYWOWYM - WERYFIKACJA PEWNEJ METODY OBLICZENIOWEJ ZA POMOCA ANEMOMETRU LASEROWEGO]**

J. KONIECZKA and J. STELLER Instytut Maszyn Przeplywowych, Prace (ISSN 0079-3205), no. 88, 1985, p. 3-16. In Polish. refs

Velocity distribution around a wing between parallel walls is calculated theoretically with allowance for the effect of separation using an adaptation of Jacob's method. The results obtained are then compared with laser anemometer measurements conducted in a wind tunnel. It is found that the calculation method used here provides realistic velocity distributions for normal flow with or without separation. Details of the measurement procedure are given. V.L.

### ANALYTICAL TOOLS FOR SYSTEMATIC TRANSONIC DESIGN

H. SOBIECZKY (DFVLR, Institut fuer Theoretische Stroemungsmechanik, Goettingen, West Germany) International Journal for Numerical Methods in Engineering (ISSN 0029-5981), vol. 22, Feb. 1986, p. 309-326. refs

Special transonic flows are illustrated on the basis of near-sonic model equations, in order to generate both test cases for numerical methods and simple, educational models of observed phenomena in high speed aircraft and turbomachine components. The 'fictitious gas' technique employed was originally used to find special solutions to the transonic partial differential equations; the addressing of practical requirements then led to the refinement of the method for application in numerical analysis algorithms. Such algorithms will become increasingly valuable if systematic three-dimensional configurational design can rest on mature numerical codes as well as on a better understanding of three-dimensional flow phenomena. O.C.

### INVERSE METHOD WITH GEOMETRIC CONSTRAINTS FOR TRANSONIC AEROFOIL DESIGN

J. M. FRAY, J. W. SLOOFF, J. W. BOERSTOEL, and A. KASSIES (Nationaal Lucht- en Ruimtevaartlaboratorium, Amsterdam, Netherlands) International Journal for Numerical Methods in Engineering (ISSN 0029-5981), vol. 22, Feb. 1986, p. 327-339. refs

An engineering method for the design of aerofoils having a prescribed pressure distribution in subsonic or transonic flow is described. The method is based on an iterative procedure of 'residual-correction' type. In each iteration step, the difference between a current and a target pressure distribution (residual) is determined by a fast (multi-grid) finite-volume full-potential code. Corrections to the geometry driving the pressure residual to zero are determined by a global, inverse, thin-aerofoil theory based method for the subsonic part of the flow field, and by means of a local, inverse, wavy-wall theory based formula for the supersonic part of the flow field. The determination of the geometry correction has been formulated as a minimization problem in the sense that pressure distribution and geometry requirements may be balanced in a weighted least squares sense. The method is described briefly, including the basic mathematical/physical formulation and the main computational aspects. The capabilities of the method are illustrated by means of examples of aerofoil designs. Author

### APPLICATION OF ELLIPTIC CONTINUATION METHOD FOR TRANSONIC AEROFOIL DESIGN AND EXPERIMENTAL VERIFICATION

G. REDEKER, G. WICHMANN (DFVLR, Institut fuer Entwurfst Aerodynamik, Brunswick, West Germany), and H.-CHR. OELKER (Braunschweig, Technische Universitaet, Brunswick, West Germany) International Journal for Numerical Methods in Engineering (ISSN 0029-5981), vol. 22, Feb. 1986, p. 395-416. refs

With the aid of the elliptic continuation method, transonic aerofoils for two different purposes have been optimized. The design process is described and it is shown that the optimization is more difficult for higher design Mach numbers. The results of experimental investigations confirmed to good aerodynamic performances of the designed aerofoils, although no real shock-free pressure distributions could be achieved in the experiments and the highest aerodynamic efficiencies occurred always at higher lift coefficients, with pressure distributions already having shock waves. Author

**A86-36207**

### INVERSE DESIGN OF SUPERCRITICAL NOZZLES AND CASCADES

E. SCHMIDT and P. BERGER (Stuttgart, Universitaet, West Germany) International Journal for Numerical Methods in Engineering (ISSN 0029-5981), vol. 22, Feb. 1986, p. 417-432. refs

A computation method for the inverse design of supercritical cascades is described. It yields the flow field and the cascade geometry for a prescribed velocity distribution, which may be optimized by boundary-layer calculation. Some developments of the method for convenient application and high accuracy - automatic tuning of the upstream boundary distributions, local mesh refinement with emboxed regions for high resolution of steep gradients - are shown. Comparison between calculation and experiment of the complete flow field is made for a supercritical nozzle flow, and comparisons with another method for a turbine cascade. A supercritical compressor cascade and blades for a three-stage axial compressor have been designed. They produced lower losses and higher efficiency in comparison with conventional NACA blades. Author

### THE METHOD OF FUNDAMENTAL SOLUTIONS IN AERODYNAMICS. II APPLICATIONS TO THE THEORY OF LIFTING SURFACES IN SUPERSONIC FLOW

L. DRAGOS (Bucuresti, Universitatea, Bucharest, Rumania) Archiwum Mechaniki Stosowanej (ISSN 0373-2029), vol. 37, no. 3, 1985, p. 221-230. refs

A new theory of the lifting surface in supersonic flow is given. The perturbation produced by a momentum source in uniform flow is determined, and the representation of the perturbation produced by the surface in the basic flow is obtained by assimilating the lifting surface by a continuous distribution of momentum sources of unknown intensity. The boundary conditions lead to the formula and the integral equation which determine the unknown functions. The method of fundamental solutions is shown to lead directly to the Homentcovschi representation and equation. The plane solution is obtained as a particular case. C.D.

### INVESTIGATION OF HEAT TRANSFER IN SEPARATION REGIONS IN SUPERSONIC FLOW IN A LAVAL NOZZLE [ISSLEDOVANIE TEPLOOBMENA V OTRYVNYKH OBLASTIAKH, OBTEKAEMYKH SVERKHZVUKOVYM POTOKOM V SOPLE LAVALIA]

E. G. ZAULICHNYI and V. M. TROFIMOV PMTF - Zhurnal Prikladnoi Mekhaniki i Tekhnicheskoi Fiziki (ISSN 0044-4626), Jan.-Feb. 1986, p. 99-106. In Russian. refs

The paper describes experiments and an approximate calculation method intended to analyze heat transfer between a supersonic flow and a wall in a separation region arising on a cavity in the contour of the divergent part of a Laval nozzle. Attention is given to the behavior of the heat transfer coefficients on the cavity walls, and to the dependence of these coefficients on the longitudinal velocity gradient and Mach number at the separation point, as well as on the length of the horizontal wall of the cavity. In addition, a method for calculating heat transfer under the aforementioned conditions is proposed; the method assumes that a new boundary layer develops at the point of commencement of elevated pressure on the cavity wall, and takes into account the elevated level of flow turbulence in the attachment region. **CHARACTERISTICS OF THE INTERACTION OF INTERFERENCE AND DIFFRACTION FLOWS AT SUPERSONIC VELOCITIES [OSOBENNOSTI VZAIMODEISTVIIA INTERFERENTSIONNYKH I DIFRAKTSIONNYKH TECHENII PRI SVERKHZVUKOVYKH SKOROSTIAKH]**

M. D. BRODETSKII, A. I. MAKSIMOV, and A. M. KHARITONOV PMTF - Zhurnal Prikladnoi Mekhaniki i Tekhnicheskoi Fiziki (ISSN 0044-4626), Jan.-Feb. 1986, p. 106-116. In Russian. refs

Oil-soot and laser visualization techniques were used to investigate the supersonic flow past a plate with a longitudinal projection in the form of a combination of outer and inner bilateral corners. Experiments were conducted at freestream Mach numbers of 2.27, 3, and 4 for wide ranges of attack and slip angles. A substantially three-dimensional mixed interference-diffraction flow was observed. The interference of shocks and their interaction with boundary layers in the case of limited vertical-edge height are accompanied by the diffraction of inner shocks on the edge of the outer corner, with the formation of additional vortex systems. B.J.

**NONLINEAR LIFT CONTROL AT HIGH SPEED AND HIGH ANGLE OF ATTACK USING VORTEX FLOW TECHNOLOGY**

J. E. LAMAR (NASA, Langley Research Center, Hampton, VA) NATO, AGARD, Special Course on Fundamentals of Fighter Aircraft Design, Rhode-Saint-Genese, Belgium, Feb. 17-21, 1986, Paper. 24 p. refs

Nonlinear lift control at subsonic, transonic and low supersonic speeds owes its origin to the separated but organized vortical flows interacting with the wing upper surface. Since most of this flow originates near the wing or control-surface leading-edge, a variety of devices have been studied experimentally which interact with and/or control this flow in order to gain a beneficial effect. The benefits (effects) originally studied were only associated with lift enhancement. Whereas, now the studied benefits encompass performance increase, attention to changes in trimmed conditions and longitudinal stability, improvements in lateral stability, and the attendant variation with changing Mach number. For those devices that can be theoretically modeled, state-of-the-art computer codes have been used for device design and/or analysis. Comparisons at design and off-design conditions are presented for validation purposes. Author

**UNSTEADY TRANSONIC FLOW CALCULATIONS FOR WING-FUSELAGE CONFIGURATIONS**

J. T. BATINA Mar. 1986 16 p refs Presented at the 27th AIAA/ASME/ASCE/AHS Structures, Structural Dynamics and Materials Conference, San Antonio, Tex., 19-21 May 1986

(NASA-TM-87707; NAS 1.15:87707; AIAA-86-0862) Avail: NTIS HC A02/MF A01 CSCL 01A

Unsteady transonic flow calculations are presented for wing-fuselage configurations. Calculations are performed by extending the XTRAN3S unsteady transonic small-disturbance code to allow the treatment of a fuselage. Details of the XTRAN3S fuselage modeling are discussed in the context of the small-disturbance equation. Transonic calculations are presented for three wing-fuselage configurations with leading edge sweep angles ranging from 0 deg to 46.76 deg. Simple bending and torsion modal oscillations of the wing are calculated. Sectional lift and moment coefficients for the wing-alone and wing-fuselage cases are compared and the effects of fuselage aerodynamic interference on the unsteady wing loading are revealed. Tabulated generalized aerodynamic forces used in flutter analyses, indicate small changes in the real in-phase component and as much as a 30% change in the imaginary component when the fuselage is included in the calculation. These changes result in a 2 to 5% increase in total magnitude and a several degree increase in phase. E.A.K.

**NATURAL LAMINAR FLOW FLIGHT EXPERIMENTS ON A SWEPT WING BUSINESS JET-BOUNDARY LAYER STABILITY ANALYSES Contractor Report, Sep. 1983 - Mar. 1985**

R. A. ROZENDAAL May 1986 98 p refs

(Contract NAG1-401)

(NASA-CR-3975; NAS 1.26:3975; D6-53071) Avail: NTIS HC A05/MF A01 CSCL 01A

The linear boundary layer stability analyses and their correlation with data of 18 cases from a natural laminar flow (NLF) flight test program using a Cessna Citation 3 business jet are described. The transition point varied from 5% to 35% chord for these conditions, and both upper and lower wing surfaces were included. Altitude varied from 10,000 to 43,000 ft and Mach number from 0.3 to 0.8. Four cases were at nonzero sideslip. Although there was much scatter in the results, the analyses of boundary layer stability at the 18 conditions led to the conclusion that crossflow instability was the primary cause of transition. However, the sideslip cases did show some interaction of crossflow and Tollmien-Schlichting disturbances. The lower surface showed much lower Tollmien-Schlichting amplification at transition than the upper surface, but similar crossflow amplifications. No relationship between Mach number and disturbance amplification at transition could be found. The quality of these results is open to question from questionable wing surface quality, inadequate density of transition sensors on the wing upper surface, and an unresolved pressure shift in the wing pressure data. The results of this study show the need for careful preparation for transition experiments. Preparation should include flow analyses of the test surface, boundary layer disturbance amplification analyses, and assurance of adequate surface quality in the test area. The placement of necessary instruments and usefulness of the resulting data could largely be determined during the pretest phase. Author

(NASA-TM-87726; NAS 1.15:87726; AIAA-PAPER-86-0863)
Avail: NTIS HC A02/MF A01 CSCL 01A

Modifications that allow for more accurate modeling of flow fields when strong shocks are present were made into three dimensional transonic small disturbance (TSD) potential theory. The Engquist-Osher type-dependent differencing was incorporated into the solution algorithm. The modified theory was implemented in the XTRAN3S computer code. Steady flows over a rectangular wing with a constant NACA 0012 airfoil section and an aspect ratio of 12 were calculated for freestream Mach numbers (M) of 0.82, 0.84, and 0.86. The obtained results are compared using the modified and unmodified TSD theories and the results from a three dimensional Euler code are presented. Nonunique solutions in three dimensions are shown to appear for the rectangular wing as aspect ratio increases. Steady and unsteady results are shown for the RAE tailplane model at $M = 0.90$. Calculations using unmodified theory, modified theory and experimental data are compared. Author

**ALESEP. PART 2: A COMPUTER PROGRAM FOR THE ANALYSIS OF LEADING EDGE SEPARATION BUBBLES ON INFINITE SWEPT WINGS**

R. L. DAVIS 3 Feb. 1986 75 p refs
(Contract NAS1-16585)
(NASA-CR-178015; NAS 1.26:178015) Avail: NTIS HC A04/MF A01 CSCL 01A

A program called ALESEP is presented for the analysis of the inviscid-viscous interaction which occurs due to the presence of a closed laminar-transitional separation bubble on an airfoil or infinite swept wing. The ALESEP code provides an iterative solution of the boundary layer equations expressed in an inverse formulation coupled to a Cauchy integral representation of the inviscid flow. This interaction analysis is treated as a local perturbation to a known solution obtained from a global airfoil analysis; hence, part of the required input to the ALESEP code are the reference displacement thickness and tangential velocity distributions. Special windward differencing may be used in the reversed flow regions of the separation bubble to accurately account for the flow direction in the discretization of the streamwise convection of momentum. The ALESEP code contains a forced transition model based on a streamwise intermittency function, a natural transition model based on a solution of the integral form of the turbulent kinetic energy equation, and an empirical natural transition model. **ROTOR PERFORMANCE CHARACTERISTICS FROM AN AEROACOUSTIC HELICOPTER WIND-TUNNEL TEST PROGRAM**

D. R. HOAD, J. W. ELLIOTT, and N. M. ORIE May 1986 99 p refs
(Contract DA PROJ. 1L1-62209-AH-76)
(NASA-TM-87661; L-16078; NAS 1.15:87661; AVSCOM-TM-86-B-1) Avail: NTIS HC A05/MF A01 CSCL 01A

An investigation of helicopter rotor noise at model scale was conducted in the Langley 4 by 7 meter tunnel. The program described was the first of a planned three-phase project whose purpose was to examine the characteristic noise mechanism involved in main rotor/tail rotor interaction noise. This first phase was conducted with a main rotor only, in order to identify the characteristic noise generated by only the main rotor. The aerodynamic operating conditions of the rotor system were defined during the test. The acoustic data were properly referenced. Author

**THE BEHAVIOUR AND PERFORMANCE OF LEADING EDGE VORTEX FLAPS**

D. G. ELLIS Feb. 1986 79 p refs
(CAR-8601; ISBN-0-947767-34-7) Avail: NTIS HC A05/MF A01

A series of leading edge vortex flaps was studied in subsonic wind tunnel tests to determine the possibility of improving the lift/drag ratio. Various flap sizes and deflection angles, and trailing edge flap effects on leading edge vortex flap behavior were investigated. Lift/drag ratio improvements of more than 2% are found at moderate angles of attack. It is indicated that the vortex flap can improve the efficiency of slender wings when operating in aerodynamic environments which are governed by leading edge separation and flow. E.A.K.

**IN-FLIGHT MEASUREMENTS OF WING ICE SHAPES AND WING SECTION DRAG INCREASES CAUSED BY NATURAL ICING CONDITIONS**

K. MIKKELSEN, N. JUHASZ, R. RANAUDO, R. MCKNIGHT, R. FREEDMAN, and J. GREISSING May 1986 27 p refs
(NASA-TM-87301; E-3013; NAS 1.15:87301) Avail: NTIS HC A03/MF A01 CSCL 01A

Aircraft icing flight research was performed in natural icing conditions with a twin engine computer type STOL aircraft. In-flight measurements were made of the icing cloud environment, the shape of the ice accretion on the wing, and the corresponding increase in the wing section drag. Results are presented for three icing encounters. On one flight, the wing section drag coefficient increased 35 percent over the uniced baseline for cruise conditions while a 43 percent increase was observed at an aircraft angle of attack of 6.2 degrees. **INVESTIGATION OF ROLLING-UP AND INTERACTION OF LEADING-EDGE AND TRAILING-EDGE VORTEX SHEETS ON A SLENDER DELTA WING**

X. YIN, N. XIA, and G. DENG 15 Jan. 1986 24 p refs Transl. into ENGLISH from Lixue Xueboa (China), v. 16, no. 5, Sep. 1984 p 454-462
(AD-A163692; FTD-ID(RS)T-1041-85) Avail: NTIS HC A02/MF A01 CSCL 20D

The objective of this paper is to establish a simple two-dimensional theoretical model in an attempt to use a computer to numerically simulate the experimental results of Hummel regarding the rolling-up and interaction of the leading-edge and trailing edge vortex sheets on a delta wing. It was found experimentally that when the leading vortex is present the trailing-edge vortex sheet will roll up another vortex downstream from the trailing-edge. Furthermore, the circulation of the leading-edge vortex is opposite in direction to that of the trailing-edge vortex. The numerical results are in good agreement with the experimental pictures. GRA

**EXPERIMENTAL STUDY OF THE SUPERSONIC TURBULENT BOUNDARY LAYER ON A BLUNTED AXISYMMETRIC BODY**

**Final Report, 1 Aug. 1982 - 31 Jul. 1985**

D. S. DOLLING 30 Sep. 1985 25 p refs
(Contract DAAG29-84-M-0432)
(AD-A163736; ARO-22362.1-EG) Avail: NTIS HC A02/MF A01 CSCL 20D

Surface pressure distributions and turbulent boundary layer velocity profiles have been measured on a tangent-ogive cylinder model at small angles of attack (0-4.5 deg) in a high Reynolds number, Mach 3 airflow. The model wall temperature was approximately adiabatic. The measurements were made using pointed, tangent-hemisphere and flat-faced nose tips. The effects of tip blunting on the wind- and leeside velocity profiles, integral thicknesses, shape factor, power law exponent, skin friction coefficient and wake strength parameter are presented. It is shown that the results obtained using different geometry tips can be correlated using a bluntness length-scale obtained by integration of the local tip surface angle from the stagnation point to the point corresponding to shock detachment. **USE OF STATE ESTIMATION TO CALCULATE ANGLE-OF-ATTACK POSITION ERROR FROM FLIGHT TEST DATA M.S. Thesis**
T. H. THACKER Oct. 1985 99 p refs
(AD-A163962; AFIT/GAE/AA/85J-3) Avail: NTIS HC A05/MF A01 CSCL 20D

This thesis determined the position errors of an aircraft's angle-of-attack (AOA) sensor using state estimation with flight test data. The position errors were caused by local flow and upwash and were found to be a function of AOA and Mach number. The test aircraft used in this project was a T-38A Talon supersonic trainer from the USAF Test Pilot School configured with a Vought yaw and pitch system noseboom and an internal Aydin-Vector data acquisition system (DAS). The position errors were found by calculating the true AOA using equations of motion and DAS parameters. The data from the DAS were noise corrupted and had to be filtered. This was accomplished using state estimation in a Kalman filter. The estimated AOA was compared to the measured AOA from the noseboom sensor to obtain the position error. Accurate position errors were obtained, even in dynamic maneuvers. This method should be considered in future AOA error testing. The method was accurate enough to identify a hysteresis error in the T-38's AOA sensor of + or - 0.5 degrees, which was confirmed by ground calibration. GRA

**INCREMENTS IN AEROFOIL MAXIMUM LIFT COEFFICIENT DUE TO DEPLOYMENT OF VARIOUS HIGH-LIFT DEVICES**
Dec. 1985 36 p refs
(ESDU-85033; ISBN-0-85679-539-9; ISSN-0141-397X) Avail: ESDU

This data item ESDU 85033, an addition to the Aerodynamics Sub-Series, uses a semi-empirical method to predict the increase in the maximum lift coefficient from that of the basic aerofoil either estimated by the method of ESDU 84026 or obtained by test. Devices considered are plain leading-edge flaps, slats, Krueger flaps with or without vents, and plain and split trailing-edge flaps. The method applies to low speed flow for a practical range of Reynolds number and geometries, and also yields the zero lift incidence with the devices deployed. Comparison of prediction with test is made, and standard deviations are tabulated for each type of device. The overall accuracy for all devices over 141 experimental points is a standard deviation of 0.018 in maximum lift coefficient. Author

**TRANSONIC AIRFOIL ANALYSIS AND DESIGN IN NONUNIFORM FLOW**
J. F. CHANG and C. E. LAN Washington NASA Jun. 1986 84 p refs
(Contract NAG1-308)
(NASA-CR-3991; NAS 1.26:3991; CRINC-FRL-602-2) Avail: NTIS HC A05/MF A01 CSCL 01A

A nonuniform transonic airfoil code is developed for applications in analysis, inverse design and direct optimization involving an airfoil immersed in propfan slipstream. Problems concerning the numerical stability, convergence, divergence and solution oscillations are discussed. The code is validated by comparing with some known results in incompressible flow. A parametric investigation indicates that the airfoil lift-drag ratio can be increased by decreasing the thickness ratio. A better performance can be achieved if the airfoil is located below the slipstream center. Airfoil characteristics designed by the inverse method and a direct optimization are compared. The airfoil designed with the method of direct optimization exhibits better characteristics and achieves a gain of 22 percent in lift-drag ratio with a reduction of 4 percent in thickness. Author

**PITCH-LOCATION EFFECTS ON DYNAMIC STALL M.S. Thesis**
R. L. DIMMICK Dec. 1985 188 p refs
(AD-A164322; AFIT/GAE/AA/85D-4) Avail: NTIS HC A09/MF A01 CSCL 20D

Experimental investigations were conducted in the AFIT Smoke Tunnel to study the effects of pitch-location on dynamic stall. A NACA 0015 airfoil was rotated about four different locations at a constant angular rate and digital position and pressure information were recorded. This information was then converted into airfoil pressure distributions and integrated numerically to obtain airfoil force coefficients. Results of this investigation showed a direct relationship between the dynamic-stall angle of attack and the non-dimensionalized angular rotation rate, ND, defined as one-half the airfoil chord length times the angular rate divided by the freestream velocity. Based on the rotation points forward of the mid-chord, it was also shown that dynamic stall is delayed as the pitch location is moved aft from the leading edge. Experimental data was obtained for pitch locations of .08c, .25c, .50c and .61c and non-dimensional angular rates between .011 and .065. GRA

**HYPERSONIC FLOW AROUND A WING AT LARGE ANGLES OF ATTACK WITH DETACHED COMPRESSION JUMP Abstract Only**
V. N. GOLUBKIN and V. V. NEGODA *In its* USSR Report: Engineering and Equipment (JPRS-UEQ-86-006) p 87 14 Mar. 1986 refs Transl. into ENGLISH from Izv. Akad. Nauk SSSR: Mekhanika Zhidosti i Gaza (USSR), no. 3, May-Jun. 1985 p 149-157 Original language document was announced in IAA as A85-44788
Avail: NTIS HC A06/MF A01

A study is made of the flow around a thin delta wing with finite delta angle at large angles of attack. A theory presented in earlier works describes a conical flow with a compression jump attached only at the apex of the delta wing. Possible conditions of flow around the wing at large angles of attack are classified. The results indicate that the asymptotic theory of the shock layer for a wing of finite span is the most general, since it describes all three qualitatively different flow conditions; with a compression jump attached to the leading edge, attached only to the apex or completely detached. A general solution is obtained which allows for nonequilibrium physicochemical processes and heat radiation of the gas at high temperatures. Author

Avail: NTIS HC A06/MF A01

Experimental results are presented on flow past thin porous metallic disks and square plates at high angles of attack (75 to 90 deg), Mach numbers of 2.0 to 3.0 and Reynolds number of 2 to 4 million in a supersonic wind tunnel. The features characterizing flow past such screens are found to be determined by intense self sustaining gas injection into the base region. The dependence of the aerodynamic characteristics on the porosity coefficient of the screen is studied for a freestream Mach number of 3. B.J.

**FLOW AROUND DELTA WINGS WITH BROKEN-LINE LEADING EDGES Abstract Only**
A. I. SHVETS *In its* USSR Report: Engineering and Equipment (JPRS-UEQ-86-001) p 3 24 Jan. 1986 Transl. into ENGLISH from Izvestiya Akademii Nauk SSSR: Mekhanika Zhidkosti i Gaza (Moscow, USSR), no. 1, Jan. - Feb. 1985 p 171-175
Avail: NTIS HC A06/MF A01

Two design concepts of delta wings for optimal performance at hypersonic velocities are compared on the basis of experimental data and analytic evaluation. Plain delta wings triangular in the plan view, with the dihedral angle ranging from 180 deg in a flat triangular wing to 0 deg in a completely folded one were considered. Tests were performed on such wings with 150 to 180 deg at angles of attack from -2 to +15 deg in a wind tunnel with the wind velocity varied over the Mach number 4 to 8. Tests were performed on five models of delta wing with broken line leading edges with a 70 deg sweepback angle of the nose and a 50 deg sweepback angle of the tail, all having the same 100 mm half span in the plan view but each having a different dihedral angle of 60, 100, 140, 180, and 220 deg respectively. Both the lift coefficient and the drag coefficient were measured in the wind tunnel at a wind velocity corresponding to the Mach number 3, for determining their dependence and the lift to drag ratio on the angle of attack. The aerodynamic characteristics of the wing models with the optimal dihedral angle were found to be better than those of flat wings with broken line leading edges. Author

**MOVEMENT OF FLEXIBLE WING AT SUPERSONIC VELOCITY UNDER INFLUENCE OF RANDOM GUST Abstract Only**
B. A. YERSHOV *In its* USSR Report: Engineering and Equipment (JPRS-UEQ-86-001) p 4-5 24 Jan. 1986 Transl. into ENGLISH from Vestnik Leningradskogo Universiteta: Matematika, Mekhanika, Astronomiya (Leningrad, USSR), no. 1, Jan. - Mar. 1985 p 59-63
Avail: NTIS HC A06/MF A01

The motion of an elastic wing of infinite span in an ideal compressible fluid under the action of a turbulent stream is modeled by a random vertical gust. The unperturbed motion is the movement of a rigid wing at constant horizontal velocity greater than the speed of sound in the undisturbed stream. The perturbed motion is the deformation of the wing. The problem is reduced to an integro-differential equation in partial derivatives. The problem is one of connected aeroelasticity, such that the deformation of the elastic wing excited by the air stream changes the air stream itself. The present problem is determined by the wave equation for the excited velocity potential and the equation of oscillation of the infinite wing plate, related by the boundary condition on the wing. ## AIR TRANSPORTATION AND SAFETY

Includes passenger and cargo air transport operations; and aircraft accidents.

**A86-33780**
**SETTING ACCEPTABLE LEVELS OF SAFETY FOR THE NATIONAL AIRSPACE SYSTEM**
A. C. BUSCH and B. F. COLAMOSCA (FAA, Technical Center, Atlantic City, NJ) IN: Human Factors Society, Annual Meeting, 29th, Baltimore, MD, September 29-October 3, 1985, Proceedings. Volume 1 . Santa Monica, CA, Human Factors Society, 1985, p. 52-56.

The FAA is engaged in a major effort to safely reduce the vertical separation standard to 1,000 feet between aircraft flying above 29,000 feet, and to develop system performance requirements which, if met, will ensure safe operation of the National Airspace System. To accomplish this an overall program structure of defining risk/safety criteria, a risk assessment program, and a risk management program are proposed. Included in this effort is an extensive in situ data collection effort. Hopefully, the conclusion of this effort will result in providing to management the quantitative decision tools and information necessary to make the decision for the safe reduction of the vertical separation standard and to implement changes to the National Airspace System to support new separation procedures. Author

**PILOT ERROR ACCIDENTS - A TOTAL SYSTEM APPROACH TO ANALYSIS**
P. G. STRINGER and D. D. RILEY (Essex Corp., Alexandria, VA) IN: Human Factors Society, Annual Meeting, 29th, Baltimore, MD, September 29-October 3, 1985, Proceedings. Volume 1 . Santa Monica, CA, Human Factors Society, 1985, p. 526-530.

A total system approach (TSA) for evaluating aircraft/pilot performance and safety, and for recommending aircraft design improvements is described. The TSA involves an analysis of pilot error accident data in order to develop a model of task performance. The system elements of the TSA model, which include mission, aircraft characteristics, environment, pilot capacity, and cockpit interface, are examined. The model assesses the balance between flight requirements and pilot capabilities. The development of an aircraft and accident data management and analysis program is proposed. I.F.

**A86-35365*** Analytical Mechanics Associates, Inc., Mountain View, Calif.
**DESIGN OF AN ADVANCED FLIGHT PLANNING SYSTEM**
J. A. SORENSEN and T. GOKA (Analytical Mechanics Associates, Inc., Mountain View, CA) IN: 1985 American Control Conference, 4th, Boston, MA, June 19-21, 1985, Proceedings. Volume 2 . New York, Institute of Electrical and Electronics Engineers, 1985, p. 663-668. refs
(Contract NAS1-17345)

The demand for both fuel conservation and four-dimensional traffic management require that the preflight planning process be designed to account for advances in airborne flight management and weather forecasting. The steps and issues in designing such an advanced flight planning system are presented. Focus is placed on the different optimization options for generating the three-dimensional reference path. For the cruise phase, one can use predefined jet routes, direct routes based on a network of evenly spaced grid points, or a network where the grid points are existing navaid locations. Each choice has its own problem in determining an optimum solution. Finding the reference path is further complicated by choice of cruise altitude levels, use of a time-varying weather field, and requiring a fixed time-of-arrival (four-dimensional problem). Author

**PRACTICAL CONSIDERATIONS IN OPTIMAL FLIGHT MANAGEMENT COMPUTATIONS**
S. LIDEN (Sperry Corp., Aerospace and Marine Group, Phoenix, AZ) IN: 1985 American Control Conference, 4th, Boston, MA, June 19-21, 1985, Proceedings. Volume 2 . New York, Institute of Electrical and Electronics Engineers, 1985, p. 675-681. refs

The relationships between cost index, speed, flight time, fuel burn, and wind are investigated via simulations of flight of a DC-10 aircraft, as controlled by a flight management computer system (FMCS), over a representative 1000 NM flight plan. In this context, a two-part procedure is described for achieving minimum total flight cost; that is, direct operating cost plus arrival error cost. First the optimum cost index and the associated optimum arrival time (which sometimes turns out to be the scheduled arrival time) are sought. A simple method for fine tuning the speed to achieve the desired arrival time is then described. The methods are practical to incorporate in the FMCS. Author

**TIME NAVIGATION BENEFITS IN EN ROUTE METERED ATC**

R. W. SCHWAB and R. L. ERWIN, JR. (Boeing Commercial Airplane Co., Seattle, WA) IN: 1985 American Control Conference, 4th, Boston, MA, June 19-21, 1985, Proceedings. Volume 2 . New York, Institute of Electrical and Electronics Engineers, 1985, p. 682-686. refs

This paper evaluates benefits to be expected from an early use of Time Navigation (TNAV) capabilities now under engineering development for Flight Management Computer Systems (FMS) operating in the U.S. into airports where En Route Metering (ERM) is currently operational or is scheduled to become operational. The benefits estimates are based on the ability to define and fly fuel-efficient, ATC compatible profiles to meet metering objectives into busy terminal areas. Near-term benefits are quantified from simulation studies of two currently metered airports, Denver and Dallas-Ft. Worth, projected to all planned ERM airports. Consideration of frequency of obtaining nonconflicting 'TNAV Cleareances' is examined. The savings quantified are based on the use of improved delay absorption techniques using an enhanced FMS. Future operations of TNAV may provide additional fuel savings through reduction of system delay levels and the incorporation of optimization methods to maximize fuel savings. Author

**A86-35449**

**DEVELOPMENT OF AN AUTHORITATIVE AID TO WIND SHEAR TRAINING**

C. R. HIGGINS (Boeing Commercial Airplane Co., Seattle, WA) IN: Aerospace Behavioral Engineering Technology Conference, 4th, Long Beach, CA, October 14-17, 1985, Proceedings . Warrendale, PA, Society of Automotive Engineers, Inc., 1985, p. 195-197. (SAE PAPER 851919)

The development of an authoritative aid to provide pilots with wind shear training guidance is proposed. Analyses of accident data reveal that it is necessary to establish flight crew training requirements for handling wind shear. The need to coordinate meteorological, engineering, flight operation, and flight crew training data in order to produce the authoritative aid is discussed. I.F.

**A86-35450**

**UNITED AIRLINES WINDSHEAR TRAINING UPDATE**

D. A. SIMMON, JR. (United Airlines, Inc., Chicago, IL) IN: Aerospace Behavioral Engineering Technology Conference, 4th, Long Beach, CA, October 14-17, 1985, Proceedings . Warrendale, PA, Society of Automotive Engineers, Inc., 1985, p. 199-208. (SAE PAPER 851920)

The formation of the United Airlines wind shear training program is described. The human engineering aspects of wind shear training and crew coordination are examined. Flight crew actions regarding wind shear involve: (1) avoidance of wind shear; (2) evaluation of the weather conditions; (3) following standard takeoff and landing techniques; (4) following precautions during takeoff and landing; and (5) recovery from wind shear. I.F.

**A86-35451**

**COCKPIT COMMUNICATION AND AIRCRAFT SAFETY - AN EMPIRICAL STUDY**

J. WOELFEL and B. STOVER (New York, State University, Albany) IN: Aerospace Behavioral Engineering Technology Conference, 4th, Long Beach, CA, October 14-17, 1985. Proceedings . Warrendale, PA, Society of Automotive Engineers, Inc., 1985, p. 213-224. refs (SAE PAPER 851858)

Recent investigations into the cause of aircraft accidents have revealed that the way flight-crew members interact has a dramatic effect on the ultimate outcome of a flight. The Galileo System is presented as a research tool designed to measure attitudes within any cognitive system for a given population. The results of one Galileo study (conducted on general aviation crews) demonstrate that the average structure of flight crew attitudes is without defects or areas for concern. The study concluded by calling for caution in changing an attitude system that has served the aviation system well. K.K.

**A86-35452**

**FAULTY COCKPIT COMMUNICATION AS A FACTOR IN THE FAILURE OF FLIGHT 90**

D. A. COUCHMAN (New Mexico State University, Las Cruces) IN: Aerospace Behavioral Engineering Technology Conference, 4th, Long Beach, CA, October 14-17, 1985, Proceedings . Warrendale, PA, Society of Automotive Engineers, Inc., 1985, p. 225-230. refs (SAE PAPER 851859)

The importance of cockpit communication is described by analyzing flight data. The relationship between poor cockpit communication and role differentiation, problem solving strategies, lack of decisive command, and crew attitude is investigated. The need for a good interface between cockpit automation and the crew is examined. The improvement of aviation safety through group interaction training is discussed. I.F.

**A86-35456**

**TWIN-ENGINE TRANSPORT EXTENDED RANGE OPERATIONS**

J. HOWELL (Air Line Pilots Assocation International, Washington, DC) IN: Aerospace Behavioral Engineering Technology Conference, 4th, Long Beach, CA, October 14-17, 1985, Proceedings . Warrendale, PA, Society of Automotive Engineers, Inc., 1985, p. 389-395. (SAE PAPER 851960)

Design improvements recommended by pilots for extended range operations with twin-engine transport aircraft (ETOPS) are described. The need for hardware design changes in the fuel tank and the flight management computer system is examined. New standards for propulsion system reliability APUs, enroute alternate weather minima, validation flight, and status software are proposed. The advantages these recommendations will provide to ETOPS are discussed. I.F.

**A86-35609**

**FAA CERTIFICATION CRITERIA FOR LIGHTNING PROTECTION OF HELICOPTER DIGITAL ENGINE CONTROL**

R. L. VAUGHN (FAA, Fort Worth, TX) IN: American Helicopter Society, Annual Forum, 41st, Fort Worth, TX, May 15-17, 1985, Proceedings . Alexandria, VA, American Helicopter Society, 1985, p. 131-136. refs

'Change 2' to the FAA advisory circular 29-2, 'Certification of Transport Category Rotorcraft', concerns the lightning strike-related requirements for helicopters equipped with full authority digital engine control systems. Attention is presently given to the advisory circular's characterization of the worst case lightning environment, and the types of tests and analyses that are acceptable in lieu of a full scale, full level vehicle test. The pilot must be able to maintain helicopter operation through the worst case scenario. O.C.

**A86-35656*** Sikorsky Aircraft, Stratford, Conn.

**THE PERFORMANCE CHARACTERISTICS OF SIMULATED ICE ON ROTORCRAFT AIRFOILS**

R. J. FLEMMING (United Technologies Corp., Sikorsky Aircraft Div., Stratford, CT), R. J. SHAW (NASA, Lewis Research Center, Cleveland, OH), and J. D. LEE (Ohio State University, Columbus) IN: American Helicopter Society, Annual Forum, 41st, Fort Worth, TX, May 15-17, 1985, Proceedings . Alexandria, VA, American Helicopter Society, 1985, p. 743-757. refs

Attention is given to the results of NASA-sponsored rotorcraft icing research which was aimed at the formulation of a predictive method for the computation of performance penalties due to rotor and airfoil icing. Parametric simulated ice test results obtained in wind tunnels are compared with those of other investigations. These comparisons indicate that proper design of simulated ice shapes can adequately represent ice on airfoil sections, with incremental lift, drag, and pitching moments matching those generated in icing wind tunnels. O.C.

**ICE DETECTOR Patent Application**

L. M. WEINSTEIN, inventor (to NASA) 31 Mar. 1986 14 p
(NASA-CASE-LAR-13403-1; NAS 1.71:LAR-13403-1; US-PATENT-APPL-SN-846429) Avail: NTIS HC A02/MF A01 CSCL 01C

An ice detector for aircraft that can accurately determine the presence and thickness of ice and control devices to remove it is proposed. A small depression on the surface of an aircraft structure is filled with a plastic or epoxy material. Two capacitance gauges and a temperature gauge are embedded in this material near the surface. When moisture forms on the surface the capacitance of each of the gauges changes. This signal combined with the signal from a temperature gauge determines whether the moisture is water or ice. If ice is present its thickness may be measured based on the output of the second capacitance gauge. Once the presence of ice is determined, the thickness is easily determined. The output of the device may be used to provide an indication to the pilot or to automatically control heating elements to remove the ice. Author

**APPLICATION OF ARTIFICIAL INTELLIGENCE TO IMPROVE AIRCRAFT SURVIVABILITY M.S. Thesis**

W. L. DECKER Dec. 1985 76 p refs
(AD-A164172; AD-E750890) Avail: NTIS HC A05/MF A01 CSCL 06D

The hazards associated with the critical flight phases of civil as well as military flight operations can seriously degrade pilot efficiency, and therefore aircraft survivability, if the number or complexity of tasks that the pilot must manage exceeds his/her capabilities. This thesis explores the feasibility of applying artificial intelligence (AI) research to the construction of a Survivability Manager (SM) knowledge based system (KBS) that will assist the pilot by assuming a portion of the survivability task management load. The application of KBS principles to survivability management is illustrated using the normal and emergency management procedures for a hypothetical engine fuel supply system as a working example. Though the SM is not a reality today, there is considerable research in both AI and survivability enhancement studies to draw upon. It is recommended that a prototype be developed using currently available assets to further investigate the feasibility of the Survivability Manager. GRA

**KRASH DYNAMICS ANALYSIS MODELING: TRANSPORT AIRPLANE CONTROLLED IMPACT DEMONSTRATION TEST Final Report, Jan. 1984 - Sep. 1984**

G. WITTLIN and B. LABARGE Mar. 1986 178 p refs Revised
(Contract DTFA03-84-C-00004)
(DOT/FAA/CT-85/9-REV; LR-30776-REV) Avail: NTIS HC A09/MF A01

A transport airplane Controlled Impact Demonstration (CID) test is analyzed with program KRASH. Prior to modeling the test conditions, supporting analysis of both narrow-body and wide-body transport airplane frame segments were modeled with KRASH and compared to existing test results. The results of the analysis are utilized as input data for the KRASH CID model. Prior to the CID test a narrow-body transport airplane was impacted with the ground, via a free fall drop, to obtain structure crush and damage data. The KRASH modeling of this test was used to refine the CID KRASH model. The CID KRASH model is exercised to obtain anticipated floor acceleration, underside crush, fuselage forces, and deflections. All KRASH modeling is performed utilizing current enhancement features. Recent KRASH85 coding changes; KRASH models and results for both narrow-body and wide-body transport airplane frame section drop tests; KRASH model and results for a narrow-body airplane drop test; KRASH model and results for a CID test; and conclusions based on the CID pre-test analysis results are presented. **AIRCRAFT ACCIDENT REPORT: AIR CANADA FLIGHT 797, MCDONNELL DOUGLAS DC-9-32, C-FTLU, GREATER CINCINNATI INTERNATIONAL AIRPORT, COVINGTON, KENTUCKY, JUNE 2, 1983**

31 Jan. 1986 118 p
(PB86-910402; NTSB-AAR-86-02) Avail: NTIS MF A01; also available on subscription, North American Continent price HC $60.00/year; all others write for quote CSCL 01B

On June 2, 1983, Air Canada Flight 797, a McDonnell Douglas DC-9-32, of Canadian Registry C-FTLU, was a regularly scheduled international passenger flight from Dallas, Texas, to Montreal, Quebec, Canada, with an en route stop at Toronto, Canada. The flight left Dallas with 5 crewmembers and 41 passengers on board. About 1903, eastern daylight time, while en route at flight level 330, the cabin crew discovered a fire in the aft lavatory. After contacting air traffic control (ATC) and declaring an emergency, the crew made an emergency descent, and ATC vectored Flight 797 to the Greater Cincinnati International Airport, Covington, Kentucky. At 1920.09, eastern daylight time, Flight 797 landed on runway 27L at the Greater Cincinnati International Airport. As the pilot stopped the airplane, the airport fire department was in place and began firefighting operations. 23 passengers were not able to get out of the plane and died in the fire. The airplane was destroyed. GRA

## 03 AIR TRANSPORTATION AND SAFETY

**N86-25333#** National Transportation Safety Board, Washington, D. C. Bureau of Accident Investigation.
**AIRCRAFT ACCIDENT/INCIDENT SUMMARY REPORTS: CONCORD, CALIFORNIA, JULY 14, 1984; ATLANTA, GEORGIA, SEPTEMBER 24, 1984; JASPER, ALABAMA, DECEMBER 16, 1984; AVALON, CALIFORNIA, JANUARY 30, 1984; CHARLOTTESVILLE, VIRGINIA, FEBRUARY 17, 1984; KANSAS CITY, KANSAS, JANUARY 9, 1985**

(PB86-910410; NTSB-AAR-85-02-SUM) Avail: NTIS MF A01; also available on subscription, North American Continent price HC $60.00/year; all others write for quote CSCL 01B

The publication is a compilation of the reports of six separate aircraft accidents investigated by the National Transportation Safety Board. The accident locations and their dates are as follows: Concord, California, July 14, 1984; Atlanta, Georgia, September 24, 1984; Jasper, Alabama, December 16, 1984; Avalon, California, January 30, 1984; Charlottesville, Virginia, February 17, 1984; and Kansas City, Kansas, January 9, 1985. A Brief of Accident containing the probable cause is included for each case. GRA

## 04

## AIRCRAFT COMMUNICATIONS AND NAVIGATION

Includes digital and voice communication with aircraft; air navigation systems (satellite and ground based); and air traffic control.

**A86-33741#**
**NEW DEVELOPMENTS IN ANTENNAS OF CLASSICAL RADIO NAVIGATIONAL AND LANDING SYTEMS [NEUE ENTWICKLUNGEN VON ANTENNEN KLASSISCHER FUNKNAVIGATIONSUND LANDESYSTEME]**
G. GREVING (Standard Elektrik Lorenz AG, Stuttgart, West Germany) (URSI and Nachrichtentechnische Gesellschaft, Gemeinsame Tagung, Kleinheubach, West Germany, Oct. 7-11, 1985) Kleinheubacher Berichte (ISSN 0343-5725), vol. 29, 1986, p. 453-458. In German. refs

The development of three new high-performance antennas for the VOR (Very high frequency Omnidirectitonal Range) TACAN (Tactical Air Navigation), and ILS (Instrumentenlandesystem) navigational systems is reviewed. The objectives of the new antennas are discussed. The structure and function of the antennas are briefly described. Author

**A86-33988#**
**FIRST TESTS OF AN ONBOARD MLS RECEIVER [PREMIERS ESSAIS D'UN RECEPTEUR DE BORD MLS]**
A. CHAPELET and J.-P. MARGALA (LMT Radio Professionnelle, Boulogne-Billancourt, France) Revue Technique Thomson - CSF (ISSN 0035-4279), vol. 17, Sept. 1985, p. 591-615. In French.

The first European airborne testing of an MLS receiver, to replace the ILS in providing angular azimuth and elevation information, is reported at Bretigny-sur-Orge. Testing in November 1984 aboard the Nord 260 aircraft was conducted primarily on approach maneuvers at constant azimuth and elevation, but also on cross beam maneuvers and on runway centerline flights at constant height. Control Motion Noise (CMN) calculations, based on comparison between onboard MLS data and ground radar tracking data, were well within the maximum ICAO values. At runway threshold, the receiver azimuth function CMN is less than 0.02 degrees and the elevation function is less than 0.03 degrees. R.R.

**SIMULATION OF TIME-CONTROL PROCEDURES FOR TERMINAL AREA FLOW MANAGEMENT**
M. ALCABIN, H. ERZBERGER, L. TOBIAS (NASA, Ames Research Center, Moffett Field, CA), and P. J. OBRIEN (FAA Technical Center, Atlantic City, NJ) IN: 1985 American Control Conference, 4th, Boston, MA, June 19-21, 1985, Proceedings. Volume 2 . New York, Institute of Electrical and Electronics Engineers, 1985, p. 687-695. refs

Simulations of a terminal area traffic-management system incorporating automated scheduling and time-control (four-dimensional) techniques conducted at NASA Ames Research Center jointly with the Federal Aviation Administration, have shown that efficient procedures can be developed for handling a mix of 4D-equipped and conventionally equipped aircraft. A crucial role in this system is played by an ATC host computer algorithm, referred to as a speed advisory, that allows controllers to maintain accurate time schedules of the conventionally equipped aircraft in the traffic mix. Results are of the most recent simulations in which two important special cases were investigated. First, the effects of a speed advisory on touchdown time scheduling are examined, when unequipped aircraft are constrained to follow fuel-optimized profiles in the near-terminal area, and rescheduling procedures are developed to handle missed approaches of 4D-equipped aircraft. Various performance measures, including controller opinion, are used to evaluate the effectiveness of the procedures. Author

**A86-35437**
**THE CONSIDERATION OF PILOT FACTORS IN DEVELOPMENT OF FUTURE COLLISION AVOIDANCE SYSTEMS**
G. P. BOUCEK, JR., W. D. SMITH, and T. A. PFAFF (Boeing Commercial Airplane Co., Seattle, WA) IN: Aerospace Behavioral Engineering Technology Conference, 4th, Long Beach, CA, October 14-17, 1985, Proceedings . Warrendale, PA, Society of Automotive Engineers, Inc., 1985, p. 93-102. refs
(SAE PAPER 851807)

Pilot factors affecting the development of collision avoidance systems are studied. The requirements and functions of a collision avoidance system are described. The need to design the avionics system to transmit relevant operational information to the crew is examined. The integration of the controls and displays of the system into the flight deck and the development of a pilot/machine interface are analyzed. The evaluation of the system considering pilot factors and the certification process are discussed. I.F.

**A86-35444**

**IN FLIGHT ACCESS TO MINIMUM VECTORING ALTITUDES - A PILOT'S PERSPECTIVE**

J. M. MCCORMICK, JR. (Air Line Pilots Association International, Washington, DC) IN: Aerospace Behavioral Engineering Technology Conference, 4th, Long Beach, CA, October 14-17, 1985, Proceedings . Warrendale, PA, Society of Automotive Engineers, Inc., 1985, p. 159-171. refs

(SAE PAPER 851837)

The need for minimum vectoring altitude (MVA) data during in-flight is discussed. Various aircraft accidents caused by aircraft at incorrect altitudes, improper ATC clearances, or communication failures are described; these examples reveal the need for improved MVA information. The establishment of minimum safe altitude for instrument flight rules is examined. The advantages and disadvantages of a minimum safe altitude warning program and ground proximity warning system for improving ATC are analyzed. The inertial reference system combined with a navigation system data base, which produces a computer-generated moving-map display is studied. The use of a Mode-S Beacon system to provide timely and cost-effective MVA information to pilots is proposed. I.F.

**A86-35464**

**RADAR CHARACTERISTICS OF FLIGHT VEHICLES [RADIOLOKATSIONNYE KHARAKTERISTIKI LETATEL'NYKH APPARATOV]**

M. E. VARGANOV, IU. S. ZINOVEV, L. IU. ASTANIN, A. A. KOSTYLEV, A. IA. PASMUROV et al. Moscow, Izdatel'stvo Radio i Sviaz', 1985, 236 p. In Russian. refs

Methods for describing the scattering properties of flight vehicles and measuring their radar characteristics are reviewed, with particular attention given to the determination of the local and geometric characteristics of the scattering centers. The use of spatial processing of narrow-band signals (radioholography) for measuring local scattering characteristics is discussed, and the scattering properties of targets are analyzed for the case of complex and ultrawide-band signals. Methods for modeling dynamic and statistical radar characteristics are discussed in detail. V.L.

**DEVELOPMENT AND FLIGHT TEST OF A HELICOPTER, X-BAND, PORTABLE PRECISION LANDING SYSTEM CONCEPT**

T. J. DAVIS, G. R. CLARY (NASA, Ames Research Center, Moffett Field, CA), J. P. CHISHOLM, and S. L. MACDONALD (Sierra Nevada Corp., Reno) IN: American Helicopter Society, Annual Forum, 41st, Fort Worth, TX, May 15-17, 1985, Proceedings . Alexandria, VA, American Helicopter Society, 1985, p. 121-130. Previously announced in STAR as N85-26721.

A beacon landing system (BLS) is being developed and flight tested as a part of NASA's Rotorcraft All-Weather Operations Research Program. The system is based on state-of-the-art X-band radar technology and digital processing techniques. The BLS airborne hardware consists of an X-band receiver and a small microprocessor, installed in conjunction with the aircraft instrument landing system (ILS) receiver. The microprocessor analyzes the X-band, BLS pulses and outputs ILS-compatible localizer and glide slope signals. Range information is obtained using an on-board weather/mapping radar in conjunction with the BLS. The ground station is an inexpensive, portable unit; it weighs less than 70 lb and can be quickly deployed at a landing site. Results from the flight-test program show that the BLS has a significant potential for providing rotorcraft with low-cost, precision instrument approach capability in remote areas. Author

**PRECISION IMC APPROACHES TO HELIPORTS USING COLLOCATED MLS**

S. SHOLLENBERGER, J. H. ENIAS (FAA, Technical Center, Atlantic City, NJ), and P. S. DEMKO (U.S. Army, Ft. Monmouth, NJ) IN: American Helicopter Society, Annual Forum, 41st, Fort Worth, TX, May 15-17, 1985, Proceedings . Alexandria, VA, American Helicopter Society, 1985, p. 137-143. refs

This paper addresses several factors which influence the application of MLS operations to heliports. Determination of MLS siting criteria and course widths are addressed. These factors, along with approach angle, deceleration distance, and control of approach speed ultimately determine precision approach speed ultimately determine precision approach decision height (DH). Test results presented in the paper show that the MLS elevation antenna should be located in front of the heliport to allow for adequate deceleration distance while permitting lowest possible DH. Test results also show that if the MLS must be collocated at the heliport, DH must increase. In this case, an azimuth course width of + or - 3.5 degrees and an elevation course width of + or - one-third of the selected elevation angle yield the best overall performance. Author

**A STUDY OF A COLLISION AVOIDANCE SYSTEM MOUNTED ON A CURVED GROUND PLANE Semiannual Report**

P. H. LAW, W. D. BURNSIDE, and R. G. ROJAS Mar. 1986 114 p refs

(Contract NSG-1498)

(NASA-CR-176771; NAS 1.26:176771; REPT-716199-8) Avail: NTIS HC A06/MF A01 CSCL 17G

Research conducted on a traffic advisory and collision avoidance system (TCAS 2) mounted on a curved ground plane is described. It is found that a curved finite ground plane can be used as a good simulation model for the fuselage of an aircraft but may not be good enough to model a whole aircraft due to the shadowing of the vertical stabilizer, wings, etc. The surface curvature of this curved disc significantly affects the monopulse characteristics in the azimuth plane but not as much in the elevation plane. These variations of the monopulse characteristics verify the need of a lookup table for the 64 azimuth beam positions. The best location of a TCAS 2 array on a Boeing 737 is to move it as far from the vertical stabilizer as possible. Author

**THE EVALUATION OF THE OSGLR ALGORITHM FOR RESTRUCTURABLE CONTROLS Final Report, Dec. 1985 - Apr. 1986**

W. F. BONNICE, E. WAGNER, S. R. HALL, and P. MOTYKA Mar. 1986 177 p refs

(Contract NAS1-17556)

(NASA-CR-178083; NAS 1.26:178083; CSDL-R-1849) Avail: NTIS HC A08/MF A01 CSCL 09B

The detection and isolation of commercial aircraft control surface and actuator failures using the orthogonal series generalized likelihood ratio (OSGLR) test was evaluated. The OSGLR algorithm was chosen as the most promising algorithm based on a preliminary evaluation of three failure detection and isolation (FDI) algorithms (the detection filter, the generalized likelihood ratio test, and the OSGLR test) and a survey of the literature. One difficulty of analytic FDI techniques and the OSGLR algorithm in particular is their sensitivity to modeling errors. Therefore, methods of improving the robustness of the algorithm were examined with the incorporation of age-weighting into the algorithm being the most effective approach, significantly reducing the sensitivity of the algorithm to modeling errors. The steady-state implementation of the algorithm based on a single cruise linear model was evaluated using a nonlinear simulation of a C-130 aircraft. A number of off-nominal no-failure flight conditions including maneuvers, nonzero flap deflections, different turbulence levels and steady winds were tested. Based on the no-failure decision functions produced by off-nominal flight conditions, the failure detection performance at the nominal flight condition was determined. The extension of the algorithm to a wider flight envelope by scheduling the linear models used by the algorithm on dynamic pressure and flap deflection was also considered. Since simply scheduling the linear models over the entire flight envelope is unlikely to be adequate, scheduling of the steady-state implentation of the algorithm was briefly investigated. Author

**N86-24679#** Cranfield Inst. of Tech., Bedford (England). Coll. of Aeronautics.
**PRESSURE BASED SEPARATION IN THE UPPER AIRSPACE**
M. E. ESHELBY Feb. 1986 13 p
(CAR-8614; ISBN-0-947767-39-8) Avail: NTIS HC A02/MF A01

The vertical separation between aircraft above FL290 is 2000 ft which imposes a severe restriction on operations in the upper airspace. The possibility of reducing separations to 1000 ft has been discussed for many years but does not appear to be possible if current altimetry methods are used. The use of atmospheric pressure is proposed as the means of providing upper airspace separation. Current technology in altimetry would be adequate to enable separations based on pressure differentials to be used which allow a 50% increase in airspace utilization FL290 and FL350. The implementation cost of such a system is minimal. Author

**COMPUTED CENTERLINE MLS (MICROWAVE LANDING SYSTEM) APPROACH DEMONSTRATION AT WASHINGTON NATIONAL AIRPORT**
J. H. REMER Oct. 1985 42 p refs
(AD-A163722; DOT/FAA/CT-TN85/63) Avail: NTIS HC A03/MF A01 CSCL 17G

This report describes the Computed Centerline Microwave Landing System (MLS) Approach Demonstration Project at the Washington National Airport. The purpose of this project was to demonstrate the capability of generating and flying a computed centerline approach for a nonstandard MLS siting. Specifically, the system which was developed enables final approaches to be made to runways which have azimuth units offset from the runway centerline. This system was successfully flight tested at the Federal Aviation Administration (FAA) Technical Center, Atlantic City Airport, NJ, and at the Washington National Airport. Runway 33 was used at Washington, with its MLS azimuth unit situated 275 feet to the right of the centerline. Conclusions derived from this project indicate that computed centerline approaches are indeed feasible. Precautions must be taken however, to properly tailor the course width. Site geometry and minima also impact system performance. In addition to the flight test data plots, the report contains system hardware and software design data. GRA

**N86-25334#** Massachusetts Inst. of Tech., Lexington.
**PILOT EVALUATION OF TCAS IN THE LONG RANGER HELICOPTER**
J. W. ANDREWS 3 Jun. 1986 30 p refs Sponsored by Massachusetts Inst. of Tech., Lexington. Prepared in cooperation with Federal Aviation Administration,Washington, D.C.
(Contract F19628-85-C-0002; DOT-FA77WAI-817)
(FAA/PM-85/30; ATC-136) Avail: NTIS HC A03/MF A01 CSCL 17G

A specially modified version of the Traffic Alert and Collision Avoidance System (TCAS) was installed in a Bell Long Ranger helicopter in order to investigate the feasibility of TCAS operation in rotorcraft. This installation employed TCAS air-to-air surveillance to provide automated traffic advisories that were displayed in the cockpit on a color cathode ray tube display. As part of this study, 12 subject pilots evaluated the utility of the installation through brief test flights in the vicinity of a major airport. Among the topics investigated were the rate of alarms, the computer logic for issuing advisories, the bearing accuracy, and the display symbology. Several recommendations for adapting TCAS to the rotorcraft environment resulted from the testing. Author

**GUIDANCE STUDIES FOR CURVED, DESCENDING APPROACHES USING THE MICROWAVE LANDING SYSTEM (MLS)**
J. B. FEATHER May 1986 90 p refs
(Contract NAS1-16202)
(NASA-CR-178030; NAS 1.26:178030) Avail: NTIS HC A05/MF A01 CSCL 17G

Results for the Microwave Landing System (MLS) guidance algorithm development conducted under the Advance Transport Operating System (ATOPS) Technology Studies (NAS1-16202) are documented. The study consisted of evaluating guidance law for vertical and lateral path control, as well as speed control, for approaches not possible with the present Instrument Landing System (ILS) equipment. Several specific approaches were simulated using the MD-80 aircraft simulation program, including curved, descending (segmented glide slope), and decelerating paths. Emphasis was placed on development of guidance algorithms specifically for approaches at Burbank, where proposed flight demonstrations are planned. Results of this simulation phase are suitable for use in future fixed base simulator evaluations employing actual hardware (autopilot and a performance management system). Author

## AIRCRAFT DESIGN, TESTING AND PERFORMANCE

Includes aircraft simulation technology.

**A86-33989**
**THE SOVIET FIGHTER - FOUR DECADES OF DEVELOPMENT**
R. BRAYBROOK Air International (ISSN 0306-5634), vol. 30, April 1986, p. 163-167, 199-203.

The development of the Soviet fighter from a single-role aircraft to a multirole aircraft is reviewed. Advances in designs, avionics, capabilities, and weapon systems are described. The initial designs of MiG fighter bombers and Sukhoi jet fighters are analyzed. The Sukhoi aircraft, Yak-25, was the first Soviet all-weather jet fighter and the MiG-25 Foxbat was the first in a series of multirole fighter interceptors. The development of an aircraft with short field performance, which was initiated by the Soviets, is discussed. The capabilities of MiG-20 Fulcrum which is a two-seat configuration and the Su-27 Flanker which is an aircraft with low-wing loading and a high thrust/weight ratio are studied. The capabilities and designs of Soviet aircraft are compared with their American counterparts. I.F.

**A86-33996**
**A METHOD FOR NUMERICAL ANALYSIS OF THE DYNAMICS OF A CONTROLLED ROTOR BLADE OF A HELICOPTER**
J. MANEROWSKI Journal of Technical Physics (ISSN 0324-8313), vol. 26, no. 1, 1985, p. 75-86. refs

A model for the numerical analysis of a controlled helicopter rotor blade in hover is presented. The finite element method in its displacement version is used, and numerical integration is performed using the Wilson-Newmark method. The rotor blade is treated as a deformable beam, its rigidity, inertia, and damping parameters varying along the blade. The influence of the cross-sectional rotational inertia on the form of the blade's elastic line is taken into account. An algorithm for the numerical analysis of the dynamics of a controlled blade is proposed, and examples of computational results are presented. C.D.

**A86-34156**

**A NOTE ON THE PREDICTION OF FLYING BOAT TAKE-OFF**

D. HOWE (Cranfield Institute of Technology, England) Aeronautical Journal (ISSN 0001-9240), vol. 90, Feb. 1986, p. 49-52.

It is useful to have available simple prediction formulas for preliminary design work. In the case of landplane take-off such formulas exist, being expressed only in terms of a few major parameters. The flying boat situation is more complex due to the much greater and more variable total drag. By making appropriate assumptions an equivalent formula for flying boat take-off has been derived. Comparison of typical cases of the landplane and flying boat shows that whereas the take-off distance of the former is approximately inversely proportional to thrust/weight ratio to the power of 1.35, in the case of a flying boat it is inversely proportional to the square of thrust/weight ratio. Author

**A86-34196**

**EVOLVING 8000 PSI HYDRAULIC SYSTEMS**

J. H. BRAHNEY Aerospace Engineering (ISSN 0736-2536), vol. 6, April 1986, p. 64-70.

The development of nonflammable hydraulic and lightweight high-pressure hydraulic systems nd components for military tactical aircraft is discussed. Based on preliminary Navy computer simulation studies, an 8000-psi hydraulic system T-2C trainer limited flight test program, full-scale A-7E evaluation, and full-scale Iron Bird simulation were conducted. Test results revealed normal and stable operation, low pressure fluctuations, and a 30-percent weight and 36-percent volume reduction. An Air-Force-developed nonflammable low-molecular-weight chlorotrifluoroethylene (CTFE) polymer possesses the desired viscosity characteristics, but has a density 2.2 times that of the current hydraulic fluids. Ongoing studies are being conducted to minimize horsepower/heat rejection, to stiffen the actuators, and to improve the CTFE fluid properties. R.R.

**A86-34475**

**FOKKER 50 - REPLACING A LEGEND**

D. LEARMOUNT and I. EPTON Flight International (ISSN 0015-3710), vol. 129, March 22, 1986, p. 28-33.

The design of the Fokker 50 is examined. Features designed to improve the comfort of the passengers are discussed. Alterations in the wing configuration including changes in the wing tips and ailerons are described. The fuselage structure is composed of metal adhesive bonded laminate sheets with stringers and has an increased number of doors and windows. The use of hydraulics in the undercarriage, braking, nosewheel steering systems, and flip sections is analyzed. The flying controls of the aircraft are mechanically and manually operated by a cable system. The improvements to the flight deck of the vehicle are studied. I.F.

**A86-34920#**

**DEVELOPMENT OF THE BO 105 LS**

A. HOHLEBEIN and G. POLZ (Messerschmitt-Boelkow-Blohm GmbH, Munich, West Germany) (CASI, Annual General Meeting, 32nd, Montreal, Canada, May 27, 1985) Canadian Aeronautics and Space Journal (ISSN 0008-2821), vol. 31, Dec. 1985, p. 300-314.

The BO 105 LS is the newest version of the BO 105-family. It is specifically designed for operation at high altitudes and extreme temperature conditions as well as for improved single engine performance. This paper summarizes the technical main features and milestones of the BO 105 LS program. Performance and flight characteristics in the extreme regions of the extended flight envelope are discussed. The developmental flight test phase and the results of the numerous certification test campaigns are presented. The growth potential and versatile improvements of BO 105 LS due to the application of modern technology are discussed. Author

**A86-34924#**

**DESIGN OF THE CL-227 AIR VEHICLE**

D. J. PAISLEY (Canadair, Ltd., Montreal, Canada) Canadian Aeronautics and Space Journal (ISSN 0008-2821), vol. 31, Dec. 1985, p. 346-359.

The CL-227 rotary wing VTOL RPV, designated 'Sentinel', is capable of carrying imaging payloads in the 30-kg mass range. Attention is presently given to the mechanical, structural, dynamic, aerodynamic, and control aspects of the Sentinel as they have developed in the course of full scale engineering development efforts. The configuration of Sentinel is that of a vertically-oriented axisymmetric body with a counterrotating rotor system mounted at its center. The rotors are powered by a gas turbine engine. Sentinel's hovering capability simplifies sensor requirements. The design is highly modular to facilitate maintenance in the course of a 500-hour design service life. A full authority autopilot and inertial reference unit are used. O.C.

**A86-35151#**

**FROM WIND TUNNEL TO LARGE AIRCRAFT [VOM WINDKANAL ZUM GROSSFLUGZEUG]**

R. HILBIG (Messerschitt-Boelkow-Blohm GmbH, Bremen, West Germany) DGLR, Jahrestagung, Bonn, West Germany, Sept. 30-Oct. 2, 1985. 22 p. In German.
(DGLR PAPER 85-088)

The development of a large aircraft from wind tunnel testing to large-scale construction is briefly discussed. The characteristic-tasks of the preparatory phase, the definitional phase, and the development phase are examined, and data for some important wind tunnels are presented. The determination of relevant aircraft parameters in wind tunnels is summarized. C.D.

**A86-35152#**

**DETAILS ON THE OPTIMIZATION OF CRUISING DRAG OF THE AIRBUS A320 [DETAILS ZUR OPTIMIERUNG DES REISEFLUGWIDERSTANDES DES AIRBUS A320]**

B. HAFTMANN (Messerschmitt-Boelkow-Blohm GmbH, Bremen, West Germany) and B. KIEKEBUSCH (Messerschmitt-Boelkow-Blohm GmbH, Hamburg, West Germany) DGLR, Jahrestagung, Bonn, West Germany, Sept. 30-Oct. 2, 1985. 38 p. In German.
(DGLR PAPER 85-089)

One of the objectives of the Airbus A320 is a six percent improvement in the drag standard as compared with the standard of the A310-200. Design studies conducted toward this end on the engine-pylon configuration and on the design of the tail assembly is reviewed. The influence of rearward position, pylon position, and nozzle length on drag is discussed, and an aerodynamic design concept for the tail assembly is presented and described. The influence of the design of the horizontal stabilizers and elevators on the total drag is also addressed. C.D.

**A86-35170#**

**COMPARATIVE INVESTIGATION OF OPTIMIZATION PROCEDURES IN AIRCRAFT PRELIMINARY DESIGN [VERGLEICHENDE UNTERSUCHUNG VON OPTIMIERUNGSVERFAHREN IM FLUGZEUGVORENTWURF]**

O. KRANZ (Berlin, Technische Universitaet, West Germany) DGLR, Jahrestagung, Bonn, West Germany, Sept. 30-Oct. 2, 1985. 18 p. In German. DFG-supported research. refs
(DGLR PAPER 85-119)

This paper reports an analysis of the behavior of numerical optimization procedures in aircraft preliminary design. Basic aspects regarding the employment of optimization procedures are discussed, taking into account the error characteristics in different flight tasks, the wing aspect ratio as a function of maximum wing loading, and the derivatives of the target function in design space. The optimization procedures in aircaft preliminary design considered include tangent search methods and Lagrange methods. It is found that the tangent search methods are distinctly superior to the Lagrange methods, giving attention to computation time requirements, reliability, and user friendlines. G.R.

**A86-35176#**

**CONFIGURATION ASPECTS OF MODERN HIGH-PERFORMANCE AIRCRAFT [KONFIGURATIONSASPEKTE MODERNER HOCHLEISTUNGSFLUGZEUGE]**

G. KANNAMUELLER (Dornier GmbH, Friedrichshafen, West Germany) DGLR, Jahrestagung, Bonn, West Germany, Sept. 30-Oct. 2, 1985. 34 p. In German.
(DGLR PAPER 85-130)

The parameters which influence the design of the fighter aircraft JF 90 are discussed. Fighting ability, availability, and costs are related to each other in the context of a conflict model. The important design parameters are derived analytically along with the weapon systems design. These results are used to show what a fighter aircraft of the next generation may look like. Examples are used to demonstrate how the same fighter aircraft goals can be met in different ways by using different technologies. C.D.

**A86-35189#**

**OPTIMIZATION OF SEAPLANES [OPTIMIERUNG VON SEEFLUGZEUGEN]**

E. WILCZEK (Aachen, Rheinisch-Westfaelische technische Hochschule, West Germany) DGLR, Jahrestagung, Bonn, West Germany, Sept. 30-Oct. 2, 1985. 34 p. In German.
(DGLR PAPER 85-170)

The optimization of seaplanes for marketing in coastal countries is discussed. The way in which the distribution of population in such countries affects the market for seaplanes is considered, and the market niches that could be taken by seaplanes in these countries are examined. The optimal design of seaplanes, including hydrodynamic and aerodynamic characteristics and the best selection of materials, is discussed. C.D.

**A86-35201**

**THE IMPACT OF ACCOMMODATING DEFECTS ON THE EFFICIENCY OF AIRCRAFT DESIGN**

E. M. PETRUSHKA and G. E. LAW (General Dynamics Corp., Fort Worth, TX) Society of Allied Weight Engineers, Annual Conference, 44th, Arlington, TX, May 20-22, 1985. 10 p. refs
(SAWE PAPER 1635)

The history of the evolution of damage tolerance criteria for metals as related to the B-58, F-111, and F-16 programs is reviewed, and the yet-to-be resolved damage tolerance issues for composite structures are discussed. In particular, the effect of defects on composite compression members is discussed in relation to defect location and size information provided by new automated nondestructive inspection techniques. It is pointed out that innovative ways of cost-effective three-dimensional reinforcement must be found so that the criticality of defects can be minimized directly by design. The importance of developing more durable and damage tolerant matrix materials is also emphasized. V.L.

**IMPACT OF ADVANCED MATERIALS ON AIRCRAFT DESIGN WEIGHTS - THE WEIGHT IMPROVEMENT FACTOR**

W. D. WISSEL (Airbus Industrie, Toulouse, France) Society of Allied Weight Engineers, Annual Conference, 44th, Arlington, TX, May 20-22, 1985. 24 p. refs
(SAWE PAPER 1636)

The improved metallic and nonmetallic materials currently used in the advanced aircraft are reviewed. A new generation of advanced materials is then examined with particular reference to their weight improvement potential and to the effect of the weight improvement factor on the overall design. The new materials examined include improved epoxy matrix systems providing both high strain and good hot/wet properties, advanced thermoplastics with high mechanical and temperature/solvent properties, and aluminum-lithium alloys. The effect of the new materials on the aircraft weight is analyzed with allowance for both fixed and variable weight components, and formulas for the weight improvement factor are derived. V.L.

**APPLICATION OF DIGITAL/ELECTRIC SYSTEMS TO ADVANCED TECHNOLOGY AIRCRAFT**

A. R. BAILEY (Boeing Commercial Airplane Co., Seattle, WA) Society of Allied Weight Engineers, Annual Conference, 44th, Arlington, TX, May 20-22, 1985. 13 p.
(Contract NAS1-17528)
(SAWE PAPER 1639)

Potential improvements in weight and performance of the digital/electric airplane of the 1990s are investigated, using data based on the Integrated Digital/Electric Airplane (IDEA) study, a nine-month investigation of integrated digital/electric concepts. A baseline configuration was compared to these IDEA configurations in terms of economic performance, fuel efficiency, and significant system and aircraft configuration characteristics. The 1990 baseline configuration represents a six to eight percent performance improvement over current technology; however, the IDEA airplane shows an additional three percent improvement in fuel burn performance. This improvement is due to a reduction of over 3000 pounds in systems weight alone. K.K.

**WING ASPECT RATIO OPTIMIZATION PROBLEMS FOR TRANSPORT TURBOJET AIRPLANES**

P. A. GILI and F. B. QUAGLIOTTI (Torino, Politecnico, Turin, Italy) Society of Allied Weight Engineers, Annual Conference, 44th, Arlington, TX, May 20-22, 1985. 26 p. refs
(SAWE PAPER 1660)

A calculation method, based on Breguet's formula for the distance range, for deriving the wing aspect ratio that will optimize the fuel consumption and the payload of the transport turbojet aircraft is described. The calculation of the load ratio and fuel wing consumption is discussed; the dependence of load ratio and fuel wing consumption on the wing aspect ratio, the cruising altitude, and the range and cruising lift coefficient is examined. The fuel consumption during climb is calculated using energetic evaluation. Diagrams and graphs of the data are provided. Examples displaying the applicability of this procedure to transport aircraft are presented. I.F.

**AN AIRFRAMER'S VIEW OF AN ELECTRIC FIGHTER**

J. R. MCKENZIE (General Dynamics Corp., St. Louis, MO) Society of Allied Weight Engineers, Annual Conference, 44th, Arlington, TX, May 20-22, 1985. 13 p. refs
(SAWE PAPER 1662)

The idea of an 'All-Electric' airplane which does not require on-board or ground-support generation of hydraulic or pneumatic power is quite attractive at first glance. Facets of this concept have received much study over the last few years (primarily in the commercial arena), and many benefits and pitfalls have been determined. The most likely scenario is development of a 'More-Electric' airplane that incorporates those features that provide benefits for a specific design. This paper surveys some of the key design issues and projects hypothetical airplane implementations. Author

**THE GRUMMAN X-29 TECHNOLOGY DEMONSTRATOR - TECHNOLOGY INTERPLAY AND WEIGHT EVOLUTION**

J. E. RAHA (Grumman Aerospace Corp., Bethpage, NY) Society of Allied Weight Engineers, Annual Conference, 44th, Arlington, TX, May 20-22, 1985. 22 p. refs
(SAWE PAPER 1665)

The history of Forward Swept Wing (FSW) design prior to the X-29A technology demonstrator is briefly recalled. The integration of the FSW with other elements of the demonstrator technology suite and the necessary interplay is described. A brief description or substantiation of the technology elements is included. The goals of the demonstrator program are reviewed and related to the design characteristics of the aircraft. Challenges facing the X-29A weight engineer are recounted, stressing weight-related development, which includes: (1) flight weight design of the FSW, (2) commonality

with other aircraft, (3) weight evolution and meeting weight goals, and (4) balance-critical aspects. The X-29A design is described from a weight and balance standpoint. Finally, future technologies are described and related to the existing technology suite.

### THE MODEL 530MG - THE FORERUNNER TO THE ULTIMATE LIGHT-COMBAT HELICOPTER
R. V. MARCH (Hughes Helicopters, Inc., Mesa, AZ) Society of Allied Weight Engineers, Annual Conference, 44th, Arlington, TX, May 20-22, 1985. 44 p. refs
(SAWE PAPER 1677)

The Hughes Model 530MG Defender is a state-of-the-art rotorcraft, incorporating advances in performance as well as in cockpit and weaponization designs with minimal weight growth. In addition, an agile and effective flying platform with growth capability has been established, whose purpose is to provide broad mission flexibility for military services with variations in operational and environmental requirements around the world. It is shown that advances in performance as well as in the designs of an integrated cockpit and a modular, quick-change weapon system are present today and are expected to be standard for the U.S. Army's LHX advanced helicopter series. K.K.

### HIGHER HARMONIC CONTROL - VIBRATION REDUCTION FOR REDUCED WEIGHT
E. R. WOOD and B. P. GUPTA (Hughes Helicopters, Inc., Culver City, CA) Society of Allied Weight Engineers, Annual Conference, 44th, Arlington, TX, May 20-22, 1985. 30 p. refs
(SAWE PAPER 1679)

Higher Harmonic Control (HHC) technology has been successfully applied to helicopter vibration reduction by exercising rotor blade pitch control at frequencies which are high harmonics of rotor rotation. The control motions are generated by three electrohydraulic actuators which are commanded by an airborne microprocessor. This processor receives vibration sensor measurements, estimates the helicopter's state using a Kalman filter type algorithm, and computes the optimal controls to reduce vibrations. A conventional helicopter equipped with this device would suffer a weight penalty of 0.75 percent gross weight, but new fly-by-wire controlled helicopters would, with HHC, experience a weight penalty that is essentially zero. For these aircraft, the only contributors to weight would be the miniaturized electronic circuit boards for the HHC system and the small additional weight of the HHC panel on the pilot's instrument console. K.K.

### STARSHIP I - A WEIGHT CONTROL CHALLENGE
H. L. FRISCH (Beech Aircraft Corp., Wichita, KS) Society of Allied Weight Engineers, Annual Conference, 44th, Arlington, TX, May 20-22, 1985. 17 p.
(SAWE PAPER 1682)

The Starship I utilizes many new state-of-the-art concepts in design, materials selection, and fabrication techniques for development of a next generation business aircraft. Composite materials comprise approximately 72 percent of the aircraft structural weight and are a major contribution to the success of the program. This presentation includes a description of the aircraft configuration, weight control philosophy, and computerized mass properties accounting system. Author

**A86-35224**
### WEIGHT CONTROL OF AIRCRAFT MODIFICATION PROJECTS
P. J. BUDDINE (Grumman Aerospace Corp., Bethpage, NY) Society of Allied Weight Engineers, Annual Conference, 44th, Arlington, TX, May 20-22, 1985. 11 p.
(SAWE PAPER 1683)

It is pointed out that the Mass Properties Control and Management Plans (MPCMP's), which are normally required by the government, are extremely useful. Modification programs are considered, taking into account the EF-111A program. This program was concerned with the modification of an F-111A to an EF-111A. In the event of an emergency, the F-111A Crew Module provides the primary means of escape from the aircraft. The location of the center of gravity of the crew module represents an extremely critical factor for a safe ejection and landing process, and the permissible weight is limited to 3200 pounds. Attention is given to some elementary principles which are essential for the design of a reasonable and effective mass properties control program. It is important that a weight control program is implemented early.

### ESTIMATION OF TRANSPORT AIRPLANE AERODYNAMICS USING MULTIPLE STEPWISE REGRESSION
D. A. KESKAR (Boeing Commercial Airplane Co., Seattle, WA), V. KLEIN (NASA, Langley Research Center; Joint Institute for Advancement of Flight Sciences, Hampton, VA), and J. G. BATTERSON (NASA, Langley Research Center, Hampton, VA) IN: 1985 American Control Conference, 4th, Boston, MA, June 19-21, 1985, Proceedings. Volume 2 . New York, Institute of Electrical and Electronics Engineers, 1985, p. 927-932.

This paper presents an application of multiple stepwise regression to the flight test data of a typical transport airplane. The flight test data was carefully preprocessed to eliminate aliasing, time skews and high frequency noise. The data consisted both of basic certification maneuvers, such as wind-up-turns and maneuvers suitable for parameter estimation, such as responses to elevator pulses and doublets. It is shown that the results of multiple stepwise regression techniques compare favorably with the results obtained from maximum likelihood estimation. Finally, it is concluded that multiple stepwise regression could be a fast economical way to estimate transport airplane aerodynamics.

### TRANSIENT MODEL OF A PNEUMATIC EJECTOR - APPLICATION TO THE SIMULATION OF AIRCRAFT BLEED AIR TEMPERATURE CONTROL SYSTEMS
R. ELANGOVAN and D. L. J. BRUSHWOOD (Boeing Military Airplane Co., Wichita, KS) IN: 1985 American Control Conference, 4th, Boston, MA, June 19-21, 1985, Proceedings. Volume 3 . New York, Institute of Electrical and Electronics Engineers, 1985, p. 1187-1193. refs
(Contract F34601-82-C-2981)

A transient pneumatic ejector model suitable for use in simulation of aircraft environmental control systems is presented. The ejector model is formulated to accommodate modulation of both primary and secondary ejector flows using butterfly modulating valves. The two-state variable ejector model is employed in the simulation of an actual aircraft bleed air temperature control sytem, which utilizes ejector secondary air as the heat sink for a heat exchanger. The thermo-fluid system simulation equations and a qualitative description of control system operation are presented. Additionally, comparisons of the closed loop transient math model performance characteristics relative to actual ground and flight test results are presented. Author

### PILOT EXECUTIVE PROJECT - PILEX
R. W. WHITE and W. D. SMITH (Boeing Commercial Airplane Co., Seattle, WA) IN: Aerospace Behavioral Engineering Technology Conference, 4th, Long Beach, CA, October 14-17, 1985, Proceedings . Warrendale, PA, Society of Automotive Engineers, Inc., 1985, p. 87-91.
(SAE PAPER 851806)

The design and implementation of the Flight Status Monitor (FSM) concept are described. The pilot interfaces used for the altering, guidance, and feedback components of the FSM, and the supervisory logic provided by a knowledge-based expert system (KBES) are examined. The Pilot Executive project developed to study the FSM KBES requirements and to formulate a procedure for acquiring pilot knowledge of alert checklist integration techniques is analyzed. The three phases of the project which include concept demonstration, the integration of the system with an aircraft simulator for test and evaluation, and complete implementation of FSM KBES simulation and evaluation are discussed. I.F.

**ADVANCED CONCEPTS TRANSPORT AIRCRAFT OF 1995**

S. L. CHAPPELL (NASA, Ames Research Center; Informatics General Corp., Moffett Field, CA) and G. A. SEXTON (Lockheed-Georgia Co., Marietta) IN: Aerospace Behavioral Engineering Technology Conference, 4th, Long Beach, CA, October 14-17, 1985, Proceedings . Warrendale, PA, Society of Automotive Engineers, Inc., 1985, p. 103-108.
(SAE PAPER 851808)

The components of the Advanced Concepts Flight Simulation Facilities used to evaluate proposed human-machine interfaces are described. The facilities consist of: (1) an advanced concept flight station, which is a wide-body, composite airframe propelled by two turbo-fan engines; (2) an integrated air traffic control simulation; and (3) experimenter/observer stations. The flight controls and displays, and their operation are studied. The air traffic control provided in the simulation is examined. The control of the flight conditions and data collection by the experimenter are discussed. I.F.

**SIKORSKY AIRCRAFT CREW STATION TECHNOLOGY RESEARCH HELICOPTER**

L. STILES, JR. (United Technologies Corp., Sikorsky Aircraft Div., Strattford, CT) IN: Aerospace Behavioral Engineering Technology Conference, 4th, Long Beach, CA, October 14-17, 1985, Proceedings . Warrendale, PA, Society of Automotive Engineers, Inc., 1985, p. 143-150.
(SAE PAPER 851780)

Sikorsky Aircraft has developed a new research helicopter dedicated to the study of crew station technology. A high visibility single seat cockpit has been added to an S-76 airframe just forward of the existing cockpit. The new cockpit is linked to the aircraft systems via a variable stability fly-by-wire flight control system and is equipped with various display media, including touch sensitive CRTs, a voice interactive system, head-up display, and a visually-coupled wide field of view helmet-mounted display system. The aircraft can be operated autonomously from the new crew station, with an independent safety pilot position retained at the original right pilot station. This aircraft will permit the evaluation of advanced control and display concepts in the agile S-76 air vehicle under a full range of flight conditions. Author

**EXTENDED RANGE OPERATION OF TWIN-ENGINE COMMERCIAL AIRPLANES**

R. W. TAYLOR (Boeing Commercial Airplane Co., Seattle, WA) IN: Aerospace Behavioral Engineering Technology Conference, 4th, Long Beach, CA, October 14-17, 1985, Proceedings . Warrendale, PA, Society of Automotive Engineers, Inc., 1985, p. 377-388.
(SAE PAPER 851959)

This paper discusses safety and reliability considerations that were examined in the development of new guidelines for commercial use of twin-engine airliners for extended range operations. The 767-200ER airplane is referred to extensively becausee it was the first twin to be approved for extended range operations under the new guidelines. The key technical issues involved are engine reliability and the ability of the propulsion and airplane systems to provide safe, sustained operation during the anticipated time period of the diversion after an inflight engine and/or system failure. Airline operational considerations for extended range operations with twins are reviewed, as well as the future impact on the traveling public and the airline industry brought about by the service introduction of new technology twins. Author

**THE FLYING SIMULATOR AND TECHNOLOGY CARRIER ATTAS FROM DFVLR [DER FLIEGENDE SIMULATOR UND TECHNOLOGIETRAEGER ATTAS DER DFVLR]**

D. HANKE (DFVLR, Institut fuer Flugmechanik, Brunswick, West Germany) Luft- und Raumfahrt (ISSN 0173-6264), vol. 7, 1st Quarter, 1986, p. 4-8. In German.

A new test aircraft called ATTAS (Advanced Technologies Testing Aircraft System), constructed as a modified VFW 614 and intended to replace the flying HFB 320 simulator, is described. The features and capabilities of this system include a cockpit with electric control and indicator systems, redundant computer system with optical data transmission system, extensive measurement and avionics systems, self-monitoring electrohydraulic control elements, and safety features. The aircraft's range of applications will include flight simulations, load minimization systems, avionics testing, traffic simulation, and pilot training. C.D.

**TILTROTOR - 'COPTER AND PLANE IN ONE**

M. BONDI (NASA, Ames Research Center, Moffett Field, CA) Mechanical Engineering (ISSN 0025-6501), vol. 108, April 1986, p. 52-59.

This paper is concerned with a most unusual aircraft, called the Tiltrotor XV-15, which combines the versatility of the helicopter with the characteristics of a conventional aircraft. Two large, three-bladed propellers are mounted at the tips of the wings. For takeoff, the propellers and their engines are rotated 90 degrees, and the XV-15 can climb vertically into the air as a helicopter. When the vehicle is off the ground, propellers and engines rotate forward, and the lift is transferred from the propellers to the wings. As a conventional aircraft, the Tiltrotor can cruise for more than two hours. Operating as a vertical-takeoff aircraft, the XV-15 can fly twice as fast as a helicopter and deliver payloads on half the fuel when traveling distances greater than 185 kilometers. The results of the first three years of flight-testing are discussed, taking into account the relationship of rotor vibrations and/or air turbulence to resonance of a section of the Tiltrotor's wing. G.R.

**CORRELATION OF STABILITY TEST RESULTS AND ANALYSIS FOR THE 1/5 SCALE V-22 AEROELASTIC MODEL**

D. POPELKA, J. BILGER (Bell Helicopter Textron, Fort Worth, TX), and M. SHEFFLER (Boeing Vertol Co., Philadelphia, PA) IN: American Helicopter Society, Annual Forum, 41st, Fort Worth, TX, May 15-17, 1985, Proceedings . Alexandria, VA, American Helicopter Society, 1985, p. 17-31. refs

A semispan, 1/5-scale aeroelastic model of the V-22 tilt-rotor VTOL aircraft has been tested in the NASA-Langley Transonic Dynamics tunnel while undergoing modifications in such design parameters as hub design, blade bending stiffness, wing spar stiffness, rotor pitch-flap coupling, and pylon downstop configuration. Compressibility effects were investigated by tests in both air and freon; aerostatic stability data were obtained for a wide range of airspeeds, rotor speeds, and conversion angles. These data were correlated with aeroelastic stability analysis programs in order to validate the analytical tools being used in the V-22's full scale design process. O.C.

**A86-35605**

**EFFECTS OF ANALYTICAL MODELING ASSUMPTIONS ON THE PREDICTED STABILITY OF A MODEL HINGELESS ROTOR**

R. SOPHER and S. J. CASSARINO (United Technologies Corp., Sikorsky Aircraft Div., Stratford, CT) IN: American Helicopter Society, Annual Forum, 41st, Fort Worth, TX, May 15-17, 1985, Proceedings . Alexandria, VA, American Helicopter Society, 1985, p. 85-99. refs

The ability to predict flap lag torsion stability is presently evaluated for an aeroelastic stability analysis that is applied to test results for a stiff, inplane hingeless rotor model in hover, with a view to identifying the variables to which the analysis is sensitive. Results are obtained for six different model configurations; a good-to-fair ability is noted in the prediction of edgewise mode stability variations with pitch angle, pitch flexure stiffness, preconing, and droop. High sensitivities to equilibrium deflections, torsional representations, and aerodynamic assumptions are found. O.C.

**A86-35607**

### AIRCRAFT LIGHTING SYSTEMS

J. F. VERNEY (United Technologies Corp., Sikorsky Aircraft Div., Stratford, CT) IN: American Helicopter Society, Annual Forum, 41st, Fort Worth, TX, May 15-17, 1985, Proceedings . Alexandria, VA, American Helicopter Society, 1985, p. 111-120.

Current aircraft lighting systems design involves both consideration of unaided eye viewing as well as compatibility with night vision goggles (NVG). The prospective lighting systems engineer must have knowledge of photometrics and radiometrics as well as an understanding of the NVG's electro-optical characteristics. In checking a preliminary design concept, laboratory mock-ups must be performed using NVGs in conjunction with empirical test methods. Quantitative parameters are then established which allow preliminary specifications to be generated. A flight-worthy mock-up should be built to provide dynamic verification of design concept. Applying this basic process to the UH-60A night vision lighting development program has resulted in some important findings. In particular the use of red light for warning indicators is permissible if modified to incorporate an infrared blocking filter. Also some general guidelines for infrared exterior lighting and interior blue-green integral lighting have emerged. Author

**A86-35613**

### THE HEALTH AND USAGE MONITORING OF HELICOPTER SYSTEMS - THE NEXT GENERATION

J. D. ROE and D. G. ASTRIDGE (Westland Helicopters, Ltd., Yeovil, England) IN: American Helicopter Society, Annual Forum, 41st, Fort Worth, TX, May 15-17, 1985, Proceedings . Alexandria, VA, American Helicopter Society, 1985, p. 175-187. refs

The Helicopter Airworthiness Requirements Board's review of helicopter airworthiness made recommendations to which Health and Usage Monitoring (HUM) systems may be relevant; these onboard maintenance processor systems encompass sensors, interfaces, data links, processors, and output devices. HUMs undertake vibration analyses, debris monitoring for transmissions, power assurance checking, low cycle fatigue and thermal creep monitoring for engines, and torque and strain monitoring for complete transmission/rotor systems. Attention is given to HUM sensors and algorithms recently developed and flight tested, as well as to the effect of these systems on maintenance policies. O.C.

**A86-35620**

### HELICOPTER CABIN NOISE - ACTUAL VS. STATISTICAL ENERGY PREDICTIONS

C. A. YOERKIE and P. J. GINTOLI (United Technologies Corp., Sikorsky Aircraft Div., Stratford, CT) IN: American Helicopter Society, Annual Forum, 41st, Fort Worth, TX, May 15-17, 1985, Proceedings . Alexandria, VA, American Helicopter Society, 1985, p. 277-287.

The Statistical Energy Analysis (SEA) technique's predictions are subjected to comprehensive comparisons with measured aircraft cabin noise data obtained for an S-76 helicopter. SEA modeling is found to provide a complete description of the energy flow within the structure with a relatively small number of degrees-of-freedom, while retaining the high frequency prediction capability required for acoustics. The vibration trends for such structural elements as panels and frames are found to be in good agreement with predictions; cabin sound pressure level predictions also agree with measurements. SEA is also noted to provide insight into the flow of energy through the structure. O.C.

**A86-35624**

### FLIGHT INVESTIGATION OF BELL MODEL 206 RING FIN

H. K. HARR, P. J. HOLLIFIELD (Bell Helicopter Textron, Fort Worth, TX), and R. P. SMITH (U.S. Army, Applied Technology Laboratory, Fort Eustis, VA) IN: American Helicopter Society, Annual Forum, 41st, Fort Worth, TX, May 15-17, 1985, Proceedings . Alexandria, VA, American Helicopter Society, 1985, p. 327-337. refs

Flight testing has been conducted for a Model 206 helicopter whose conventional vertical fin was removed and replaced by several 'ring fin' configurations; these furnish a protective annulus around the tail rotor in the plane of rotation. Attention was given to the effects of such design variables as ring and dorsal fin incidence and areas. The handling quality results obtained indicate the feasibility of the ring fin as a tail rotor protection device. O.C.

**A86-35627**

### APPLICATION OF HELICOPTER AIR-TO-AIR COMBAT TEST (AACT) DATA TO CURRENT LHX CONCERNS

F. J. EBERT and N. D. LAPPOS (United Technologies Corp., Sikorsky Aircraft Div., Stratford, CT) IN: American Helicopter Society, Annual Forum, 41st, Fort Worth, TX, May 15-17, 1985, Proceedings . Alexandria, VA, American Helicopter Society, 1985, p. 367-385. refs

Extensive air-to-air combat tests have been conducted by U.S. Army, Navy and industry teams with instrumented AH-1S, OH-58, AUH-76, UH-60A, and BK-117 helicopters; the agressive maneuvers undertaken comprise elements of the projected LHX light combat helicopter's nap-of-the-earth mission. On the basis of the data thus obtained, pertinent combat issues are presently explored, and previously employed modeling tecniques are validated. Attention is given to maneuvering concepts, rotor thrust, static structures, excess power, rotating structural loads, transient load factors, and available turn rates. O.C.

**A86-35628*** National Aeronautics and Space Administration. Ames Research Center, Moffett Field, Calif.

### FREE-TIP-ROTOR WIND-TUNNEL TEST RESULTS

R. H. STROUB, L. A. YOUNG (NASA, Ames Research Center, Moffett Field, CA), C. KEYS, and M. CAWTHORNE (Boeing Vertol Co., Philadelphia, PA) IN: American Helicopter Society, Annual Forum, 41st, Fort Worth, TX, May 15-17, 1985, Proceedings . Alexandria, VA, American Helicopter Society, 1985, p. 387-411. refs

Seven controller mechanisms and several tip geometries were proposed and evaluated in the course of a free tip rotor development program which integrated those components into a model rotor system for wind tunnel testing. After a rigid whirl test was run to determine controller mechanism performance and structural integrity, a second whirl test was performed with a model rotor incorporating a selected controller design and a selected tip platform to determine the transient behavior of the tips in response to aerodynamic excitation. The results obtained demonstrate that a swept, tapered tip with a tension-torsion strap controller furnished satisfactory mechanical operation, achieved the specified output torque, possessed a low spring rate, and had fast and stable response to excitation. O.C.

**A86-35629**

### THE DESIGN OF THE EH101 FOR SAFETY AND PERFORMANCE

R. I. CASE and K. J. ANDREWS (Westland Helicopters, Ltd., Yeovil, England) IN: American Helicopter Society, Annual Forum, 41st, Fort Worth, TX, May 15-17, 1985, Proceedings . Alexandria, VA, American Helicopter Society, 1985, p. 413-422.

A development history and a performance evaluation are presented for the Anglo-Italian EH101 military helicopter. Attention is given to those aspects of structural design in the EH101 that have been optimized for flight safety, damage tolerance and crashworthiness. The extensive use of primary structure composites introduces a substantial degree of integrity for a high frequency fatigue environment, in virtue of their slow crack propagation and fail-safe characteristics. Health and usage monitoring techniques are applied, as well as a three-engine installation with highly redundant systems. O.C.

**A86-35630*** Boeing Vertol Co., Philadelphia, Pa.

### DESIGN ASPECTS OF THE XV-15 ADVANCED TECHNOLOGY BLADE PROGRAM

K. E. SMITH, H. R. ALEXANDER (Boeing Vertol Co., Philadelphia, PA), and M. D. MAISEL (NASA, Ames Research Center; U.S. Army, Aeromechanics Laboratory, Moffett Field, CA) IN: American Helicopter Society, Annual Forum, 41st, Fort Worth, TX, May 15-17, 1985, Proceedings . Alexandria, VA, American Helicopter Society, 1985, p. 423-433.

The paper discusses the design of a tiltrotor blade for application to the XV-15 research demonstration aircraft. The design features 43 deg nonlinear twist and nonuniform tapered planform. The structure is composite with extensive use of graphite in the primary structure. Instrumentation and wiring is encapsulated in the composite structure during the cure cycle. The tip shell is removable, providing access to the tracking and balance weights. This feature provides research facility of alternate tip configurations. The cuff is similarly removable. The graphite epoxy system used is high strain American Cyanamid's Celion 6000ST/Cycom 950. This is the first application of this material in rotor blades. Author

**A86-35631**

### X-WING POTENTIAL FOR NAVY APPLICATIONS

A. W. LINDEN (United Technologies Corp., Sikorsky Aircraft Div., Stratford, CT) and J. C. BIGGERS (David W. Taylor Naval Ship Research and Development Center, Bethesda, MD) IN: American Helicopter Society, Annual Forum, 41st, Fort Worth, TX, May 15-17, 1985, Proceedings . Alexandria, VA, American Helicopter Society, 1985, p. 435-450.

An evaluation is made of the performance potential offered by X-wing configuration VTOL aircraft in typical U.S. Navy missions. X-wing aircraft function as helicopters at takeoff and hover, but turn the X-planform rotor into a fixed wing platform for high speed forward flight. A development history is also given for successive refinements of the X-wing configuration in wind tunnel models and experimental aircraft. Attention is given to such performance attributes as the power required in hover and in cruise, hover control power, and empty and payload weight fractions; such Navy missions as fleet defense and combat search and rescue are defined, and the configuration of a technology demonstration aircraft is projected. O.C.

**A86-35632**

### INFLUENCES OF TWO LANDING GEAR DESIGNS ON HELICOPTER CRASHWORTHINESS AND WEIGHTS

J. K. SEN, M. W. VOTAW (Hughes Helicopters, Inc., Culver City, CA), and G. R. DOWNER (U.S. Army, Applied Technology Laboratory, Fort Eustis, VA) IN: American Helicopter Society, Annual Forum, 41st, Fort Worth, TX, May 15-17, 1985, Proceedings . Alexandria, VA, American Helicopter Society, 1985, p. 451-461. (Contract DAAK51-83-C-0039)

The systems approach to crashworthiness is applied to a study of two landing gear designs to evaluate their influences on helicopter weights for survivable crash-impact conditions. Both landing gear designs share a trailing arm configuration; however, one is coupled and the other uncoupled. The coupled design requires that both main landing gear struts stroke and absorb energy together during high roll impacts. The designs and their influences on the crushing behavior of the landing gear, fuselage and crew seat, and the responses of the occupants are evaluated with program KRASH. The results of the analysis are used to develop weight trend curves for the two designs as a function of the impact parameters (impact velocity, roll angle and pitch angle) and the probability of occurrence of survivable helicopter accidents. Author

**A86-35635*** National Aeronautics and Space Administration. Langley Research Center, Hampton, Va.

### AERODYNAMIC PERFORMANCE OF A 27-PERCENT-SCALE AH-64 WIND-TUNNEL MODEL WITH BASELINE/ADVANCED ROTOR BLADES

H. L. KELLEY and J. C. WILSON (NASA, Langley Research Center; U.S. Army, Structures Laboratory, Hampton, VA) IN: American Helicopter Society, Annual Forum, 41st, Fort Worth, TX, May 15-17, 1985, Proceedings . Alexandria, VA, American Helicopter Society, 1985, p. 491-499. refs

Performance of a 27-percent scale model of an advanced rotor designed for the AH-64 helicopter was measured in hover and at forward speeds of 50 to 130 knots. A baseline rotor, modeled after the current AH-64 rotor, was also tested to provide data for comparison. The investigation was conducted to validate procedures used at Langley to design rotors with increased performance potential and to provide a database for evaluation of current and future rotor systems. Both rotors were operated at full-scale tip speeds. Rotor thrust, forward speed, and ground height were varied for each rotor. Author

### A SKIN-STRINGER DESIGN FOR A CRASHWORTHY COMPOSITE FUSELAGE FOR THE HUGHES 500E HELICOPTER

J. K. SEN and M. W. VOTAW (Hughes Helicopters, Inc., Culver City, CA) IN: American Helicopter Society, Annual Forum, 41st, Fort Worth, TX, May 15-17, 1985, Proceedings . Alexandria, VA, American Helicopter Society, 1985, p. 547-558. refs

The design of the lower fuselage of the Hughes 500E helicopter is part of the Composite Fuselage program of Hughes Helicopters, Inc. The objectives of the program are to design, fabricate, test and fly a composite fuselage which will meet the vertical impact requirements of MIL-STD-1290 with a minimum of 22 percent savings in weight over the metal design. The design approach used on the crashworthy composite lower fuselage assembly is a simple skin-stringer design without honeycomb structural elements, but which is similar to the existing metal design. The decision to use this approach is a result of trade-off studies, design development tests, and the requirement of mating existing support components, such as the landing gear, to the composite fuselage. The design has been evaluated through impact tests and KRASH analyses. The results of the tests show that the crashworthy objectives can be met with 26 percent savings in weight and 39 percent fewer parts. Author

### EFFECTS OF VARIATIONS IN CRASHWORTHINESS CRITERIA ON SIKORSKY S-75 ACAP LANDING GEAR WEIGHTS

B. L. LEE and S. P. GARBO (United Technologies Corp., Sikorsky Aircraft Div., Stratford, CT) IN: American Helicopter Society, Annual Forum, 41st, Fort Worth, TX, May 15-17, 1985, Proceedings . Alexandria, VA, American Helicopter Society, 1985, p. 559-571. refs

(Contract DAAK51-83-C-0016)

Attention is given to the results of a study evaluating the effects of variations in airworthiness design criteria on the weight of landing gear and backup structures, using the S-75 helicopter's Advanced Composite Airframe Program design as a baseline. Such critical design parameters as sink speed, roll angles and pitch angles were separately varied in order to assess their individual effect on landing gear system loads and weights. Parametric studies of the various combinations of maximum sink speed, roll, and pitch crash conditions indicate 24-32 percent required increases in landing gear system weights. Crashworthiness criteria for future U.S. Army helicopter designs are thereby quantified. O.C.

**A86-35639**
**PRELIMINARY ESTIMATE OF FATIGUE LIFE FOR DYNAMIC COMPONENTS OF A NEW HELICOPTER**
K. B. AMER, D. H. MANCIL, and J. R. NEFF (Hughes Helicopters, Inc., Culver City, CA) IN: American Helicopter Society, Annual Forum, 41st, Fort Worth, TX, May 15-17, 1985, Proceedings . Alexandria, VA, American Helicopter Society, 1985, p. 573-582.

Attention is given to a procedure for the sizing of major helicopter dynamic components for satisfactory fatigue life during preliminary design. The procedure establishes a limited number of representative flight maneuvers and a criterion for the ratio of load in each representative maneuver to the fatigue strength; it then predicts the load at each of the maneuvers and sizes the dynamic component to meet the payload-ratio criteria. The criteria that must be met in order to achieve a 4500-hr service life are presented. O.C.

**A86-35642**
**SURVEY OF CRASHWORTHINESS ACHIEVEMENTS ON AEROSPATIALE HELICOPTERS**
J. MENS (Aerospatiale, Division Helicopteres, Paris, France) IN: American Helicopter Society, Annual Forum, 41st, Fort Worth, TX, May 15-17, 1985, Proceedings . Alexandria, VA, American Helicopter Society, 1985, p. 595-608. refs

Attention is given to proprietary helicopter crash protection techniques that have been under development since 1976 for cabin seating, fuel systems, and landing gear units; these crashworthiness-enhancing measures have entered mass production in such aircraft as the Super Puma and Dauphin helicopters. The theoretical studies on which development of these techniques was predicated consisted of parametric analyses of structural element resistance to crash damage. Attention is given to the resulting airframe structures, crashworthy seats, high energy absorption landing gear, and crashworthy fuel tanks and their interconnections. O.C.

**A86-35648**
**COMBINING ANALYSIS AND TEST FOR ROTOR BLADE DEVELOPMENT**
R. JONES and N. GIANSANTE (Kaman Aerospace Corp., Bloomfield, CT) IN: American Helicopter Society, Annual Forum, 41st, Fort Worth, TX, May 15-17, 1985, Proceedings . Alexandria, VA, American Helicopter Society, 1985, p. 639-645. refs

Attention is given to a method combining test results with analyses in order to enhance predictive capability in rotor blade development. This method has been applied to the SH-2F Composite Main Rotor Blade. Nonlinear regression equations for blade bending moments are developed as a function of blade ballast configuration, using data obtained from an aeroelastic loads program. These equations are subsequently modified on the basis of simulated test data obtained from the Rotorcraft Flight Simulation Computer Program. O.C.

**A86-35649**
**DEVELOPMENT OF A COMPOSITE TAIL ROTOR BLADE FOR THE MH-53E**
A. J. LAPATI and A. E. THOMPSON (United Technologies Corp., Sikorsky Aircraft Div., Stratford, CT) IN: American Helicopter Society, Annual Forum, 41st, Fort Worth, TX, May 15-17, 1985, Proceedings . Alexandria, VA, American Helicopter Society, 1985, p. 647-660.

MH-53E airborne mine countermeasures helicopter requirements for improved performance, unlimited replacement time, and damage tolerance in tail rotor blades have been addressed by a cocured composite blade design. Attention is given to the methods and results of the new blade's qualification tests. Full scale fatigue testing in specially designed facilities has demonstrated the required strength and damage tolerance characteristics; the critical fatigue modes revealed at the root, midspan and tip locations by crack initiation tests have been propagated to determine damage tolerance. Preflight whirl tests also yielded stability, performance, acoustic, and endurance data. O.C.

**A86-35652**
**DESCRIPTION AND INITIAL FLIGHT EXPERIMENTS - BOEING ARTI TEST BED**
C. HUTCHINSON, E. BANEY-BARTON, and R. GRADLE (Boeing Vertol Co., Philadelphia, PA) IN: American Helicopter Society, Annual Forum, 41st, Fort Worth, TX, May 15-17, 1985, Proceedings . Alexandria, VA, American Helicopter Society, 1985, p. 679-690.

A test program has been conducted to examine the automated cockpit systems required by the LHX light combat helicopter, including avionics, visionics, etc, to accomplish its missions under single pilot control. A modified Agusta 109A helicopter is the Advanced Rotorcraft Technology Integration testbed employed in these development tests. Electronic scene generation has been used to validate simulator/aircraft correlation. It is established that, in order to fly nap-of-the-earth missions in adverse nocturnal weather conditions, some type of electronic scene generation will be required. O.C.

**RSRA FLIGHT DEVELOPMENT TEST IN THE AIRPLANE CONFIGURATION**
R. E. ERICKSON, R. M. KUFELD, J. L. CROSS, and C. W. ACREE (NASA, Ames Research Center, Moffett Field, CA) IN: American Helicopter Society, Annual Forum, 41st, Fort Worth, TX, May 15-17, 1985, Proceedings . Alexandria, VA, American Helicopter Society, 198 , p. 691-704.

The Rotor Systems Research Aircraft (RSRA) was flown in the airplane configuration. Eleven successful flights were made from May 8 to October 3, 1984. The takeoff and landing method was demonstrated and the resultant parameters were obtained. Control power data were obtained. In addition, main rotor hub drag, airplane configuration acoustics data, and aircraft stability data were obtained. Hub drag, acoustics, and stability will be separately reported in more detail. The tail rotor was installed for all tests. Author

**A86-35654**
**VSTOL AIRCRAFT ICE PROTECTION DESIGN CONSIDERATIONS**
A. A. PETERSON (Boeing Vertol Co., Philadelphia, PA) IN: American Helicopter Society, Annual Forum, 41st, Fort Worth, TX, May 15-17, 1985, Proceedings . Alexandria, VA, American Helicopter Society, 1985, p. 714-723. refs

Ice Protection Systems for VSTOL aircraft such as the Bell-Boeing V-22 OSPREY Tilt-Rotor must operate in both the helicopter and the fixed-wing aircraft flight modes. This paper presents the design approaches selected and illustrates the control concepts for activating each of the ice protection subsystems. Author

**A86-35661**
**TILT ROTOR CRASHWORTHINESS**
J. D. CRONKHITE (Bell Helicopter Textron, Fort Worth, TX) and A. E. TANNER (Boeing Vertol Co., Philadelphia, PA) IN: American Helicopter Society, Annual Forum, 41st, Fort Worth, TX, May 15-17, 1985, Proceedings . Alexandria, VA, American Helicopter Society, 1985, p. 801-816. refs

Large mass relief, rollover stability, reduced pitch and roll attitude on impact, and flotation stability, are among the advantages in crashworthiness design that tilt-rotor aircraft possess over conventional helicopters. The results of a crashworthiness design feature tradeoff study conducted for the V-22 'Osprey' tilt-rotor aircraft are presented, with attention to the weight and cost effectiveness of various crashworthiness levels. The V-22 design also employs a systems approach to the provisions of occupant crash protection; the highly crashworthy composite structure incorporates a dual purpose energy absorbing underfloor, and allows controlled failure of the wings to prevent fuselage collapse. O.C.

**A86-35662**

**THE DESIGN AND DEVELOPMENT OF NEW CRASHWORTHY SEATS FOR NAVY HELICOPTERS**

B. L. CARNELL (United Technologies Corp., Sikorsky Aircraft Div., Stratford, CT) IN: American Helicopter Society, Annual Forum, 41st, Fort Worth, TX, May 15-17, 1985, Proceedings . Alexandria, VA, American Helicopter Society, 1985, p. 817-826. refs

U.S. Navy funded programs to design and develop new crashworthy crew seats for the SH-3D, G, and H anti-submarine and the CH-53A/D troop/cargo helicopters are described. The specifications for the seats include the peculiar requirements of installing stroking, load-attenuating seats in the confines of the cockpit and the need to match the loads on the seat support structures to the strengths of those structures. The seats, designed by Simula, Inc., Tempe, AZ, use variable load energy attenuators to accommodate a wide range of occupant weights. The seats for the CH-53A/D helicopters also provide armor protection for the crewmembers. Comprehensive qualification tests including operational, environmental, static, and dynamic tests are described. The improvements in crash safety are related to those of the U.S. Army BLACK HAWK helicopter. Author

**A86-35663**

**THE HUGHES INTEGRATED APPROACH TO HELICOPTER CRASHWORTHINESS PAST, PRESENT, AND FUTURE**

A. H. LOGAN and M. W. VOTAW (Hughes Helicopters, Inc., Culver City, CA) IN: American Helicopter Society, Annual Forum, 41st, Fort Worth, TX, May 15-17, 1985, Proceedings . Alexandria, VA, American Helicopter Society, 1985, p. 827-835. refs

Military requirements for improved performance and crashworthiness have necessitated changes in the design of helicopters. Future helicopters will be designed around a system of energy absorbing components that are sized to maximize performance and survivability while minimizing weight. Designs made from advanced composite materials promise higher performance levels by taking advantage of the materials' specific strength and stiffness characteristics. The effects on crashworthiness of these emerging composite designs have not been fully investigated; however, the data generated to-date, from static and dynamic crush tests, suggest that the crashworthiness levels of present metal structures can be matched or exceeded through innovative composite designs. The future generation of crashworthy helicopters will draw on these and other technological advances as well as the experience from previous successful designs. Author

**A86-35664**

**ARMY HELICOPTER CRASHWORTHINESS - LOADING THE BATTLEFIELD DICE IN OUR FAVOR**

K. F. SMITH (U.S. Army, Applied Technology Laboratory, Fort Eustis, VA) IN: American Helicopter Society, Annual Forum, 41st, Fort Worth, TX, May 15-17, 1985, Proceedings . Alexandria, VA, American Helicopter Society, 1985, p. 837-849. refs

This paper presents aspects of Army helicopter crashworthiness design with emphasis on the systems approach to energy absorption. Past successes, such as the crashworthy fuel system, are reviewed and some of the more recent findings in energy absorbing seats, composite subfloors and landing gear designs are presented. Finally, a review of proposed changes to the Army crashworthy crewseat specification (MIL-S-58095) and the aircraft crashworthiness military standard (MIL-STD-1290) are discussed. Author

**CRASHWORTHY DESIGN OF ROTORCRAFT - A BASIC RESEARCH APPROACH**

S. HANAGUD, J. I. CRAIG, D. SCHRAGE, and P. SRIRAM (Georgia Institute of Technology, Atlanta) IN: American Helicopter Society, Annual Forum, 41st, Fort Worth, TX, May 15-17, 1985, Proceedings . Alexandria, VA, American Helicopter Society, 1985, p. 851-866. refs

(Contract DAAG29-82-K-0094)

Crashworthy design of a rotorcraft constitutes a very important branch of the general field of rotorcraft design. A successful crashworthy design leads to many potential benefits. However, many different disciplines are involved and a number of constraints must be met when the subject of rotorcraft crashworthy design is analyzed. Some of the significant constraints involve the considerations of weight, cost, and performance. Potential weight savings that can be realized using composite materials when offset by additional material required for energy absorption or to maintain structural integrity offers the promise of extending the survivable crash envelope for future rotorcraft. A very brief discussion of the field, some potential problems in different disciplines concerning the crashworthy design of composite rotorcraft, and some suggestions, including basic research approaches, are presented in this paper. **PERFORMANCE DEGRADATION OF HELICOPTERS DUE TO ICING - A REVIEW**

K. D. KORKAN (Texas A & M University, College Station), L. DADONE (Boeing Vertol Co., Philadelphia, PA), and R. J. SHAW (NASA, Lewis Research Center, Cleveland, OH) AHS, Annual Forum and Technology Display, 41st, Fort Worth, TX, May 15-17, 1985, Paper. 22 p. refs

(Contract NAG3-242)

Methodology developed to predict the performance degradation of rotating systems in natural icing conditions is described and discussed. Theoretical studies of the increments performance degradation due to icing involving the propeller, helicopter in hover and forward flight, and XV-15 propulsion modes are summarized. Related experimental studies on the NACA 0012 airfoil and model helicopter with/without generic ice shapes are reviewed. The results of these experimental and theoretical studies are used to suggest refinements to current methodology. C.D.

**A RELIABILITY CONCEPT IN STRUCTURAL OPTIMIZATION OF FLIGHT VEHICLES [OB ODNOI KONTSEPTSII NADEZHNOSTI PRI OPTIMIZATSII KONSTRUKTSII LETATEL'NYKH APPARATOV]**

S. V. ARINCHEV and V. V. BYSTROV Aviatsionnaia Tekhnika (ISSN 0579-2975), no. 4, 1985, p. 7-12. In Russian. refs

A multidimensional quantile of the parameters of a system of a given order is adopted as a reliability function of the system. A lower bound on the multidimensional quantile is obtained in terms of one-dimensional quantiles, and a relationship is established between the lower bound and the known upper bound of multidimensional probability. The possibility of using this estimate as an optimization function in flight vehicle design is illustrated through numerical modeling. V.L.

**THE OPTIMAL TAKE-OFF RUN OF AN AIRCRAFT ON AN UNPAVED SURFACE [OPTIMAL'NYI RAZBEG SAMOLETA PO GRUNTU]**

A. A. BADIAGIN Aviatsionnaia Tekhnika (ISSN 0579-2975), no. 4, 1985, p. 12-16. In Russian. refs

The problem of optimizing the take-off run of an aircraft is investigated analytically. It is shown that the most favorable lift coefficient of a wing during the take-off run depends on the rolling resistance coefficient of the wheels. It is further shown that for a soft unpaved surface there exists an optimal-in-the-limit take-off run with fixed and relatively large angles of attack. V.L.

**THE EFFECT OF THE ADMISSIBLE CENTERING MISALIGNMENT OF A TRANSPORT AIRCRAFT ON ITS MASS [VLIIANIE DOPUSTIMOGO RAZBEGA TSENTROVOK TRANSPORTNOGO SAMOLETA NA EGO MASSU]**

V. P. GOGOLIN Aviatsionnaia Tekhnika (ISSN 0579-2975), no. 4, 1985, p. 24-28. In Russian.

A solution is presented for the problem of determining changes in the mass of an aircraft resulting from a centering misalignment occurring during service. The solution is based on the concept of aircraft mass increase coefficients. Computational formulas are presented, and their use is illustrated by an example. V.L.

**A86-36333**
**SUKHOI FROGFOOT**

R. BRAYBROOK Air International (ISSN 0306-5634), vol. 30, May 1986, p. 222-226.

The SU-25 Soviet fighter is configured for counterinsurgency missions, such as is evident in its Afghanistan applications. Modeled after the USAF A-X design of the late 1960s, the SU-25 has STOL capabilities similar to the A-10 aircraft, and is a large, very maneuverable jet. Differences include a slightly higher speed, smaller overall dimensions, more static thrust and a flat thrust curve. Its relatively short intake ducts are elliptical, which is thought to minimize flow distortions. The pilot relies on three rear-view mirrors and possibly a HUD display for extending the visual field. The aircraft has pylons for exterior weapons stores and fuel tanks, and is thought to be ultimately envisioned as a close support, local air superiority fighter for Central Europe. M.S.K.

**A86-36334**
**STEALTH COMES STEALTHILY**

J. JONES Air International (ISSN 0306-5634), vol. 30, May 1986, p. 227-229, 258, 259.

Stealth aircraft, actually a series of military aircraft that is part of the Covert Survivable In-Weather Reconnaissance Strike program, are asserted to have reached an initial operational stage with the F-19A fighter/reconnaissance aircraft. The design goals, defined after tests in the early 1970s, included a very low radar cross section, radar absorbent airframe and internal structure, minimized engine noise levels, cooled engine exhaust to reduce IR signature and inclusion of advanced ECM equipment. The fuselage is blended into the planform, as with the Orbiter, and the anhedral of the wing increases from root to tip. Air intakes are side-by-side above the wing and partially shielded by small winglets. The F-19A is thought to have a cruise speed of Mach 2.0 and to be made mainly of Fiberloy, i.e., boron fiber reinforced plastic. The pure metal fraction of the aircraft is under 5 percent and is mostly in the engine. The leading edges of the wings, fins and canards and the outer engine skins are made of nonreflecting CFRP material to reduce thermal and radar signatures. Much of the technology is being incorporated into the B-2B bomber prototype, which may be a flying wing for low altitude, subsonic penetration bombing missions. M.S.K.

**PACIFIC AEROSYSTEMS CONTINUES DEVELOPMENT OF HERON 26 VEHICLE**

Aviation Week and Space Technology (ISSN 0005-2175), vol. 124, April 28, 1986, p. 63, 64, 66.

The current stage of development of the Heron 26 RPV includes an on-board FLIR system and a television platform. Although eliminated from competition for a Navy procurement of the vehicles, consideration is being given to supplying the Heron avionics and ground stations for use in the Mirach-20 system, which has sales overseas. An innovative feature of the Heron is the navigation system, the Mizar, which uses Omega VLF as a primary positioning link at present and will access the GPS when it is operational. Updates can also be issued to the aircraft from the ground station through high speed burst links. The autonomy of the system permits the Heron to fly a predetermined course and return for pick-up, all automatically. The course accuracy is a 400 m circular error probability (CEP) with Omega and 50 m CEP with GPS. The Heron has a composite airframe, twin-boom tails, a pusher propeller, an overall length of 12.9 ft and a height of 3.8 ft. Flight performance is an 11,500 ft altitude normal, 20,000 ft with modifications, and cruise speed of 85 kt for 5 hr. M.S.K.

**A86-36819**
**DEVELOPMENTAL SCIENCES PREPARES SKYEYE FOR ARMY COMPETITION**

Aviation Week and Space Technology (ISSN 0005-2175), vol. 124, April 28, 1986, p. 68, 69, 72 (3 ff.).

The Skyeye R4E-40 mini-RPV is a 520 lb. maximum weight entry into the Army intelligence and EW unmanned aerial vehicle competition. The new generation of RPVs is targeted for uses as decoys and for reconnaissance and damage assessment roles. The RPV has already carried a 90 lb. FLIR system for 9.3 hr at 3000 ft altitude and a 70 kt loiter speed. The vehicle is capable of a 500 fpm climb speed to 10,000 ft and a 130 kt top speed. Besides the FLIR cameras, the Skyeye can carry IR line scanners, a 35 mm panoramic scanner and a meteorological package. The airframe is an all-composite structure with a 13.8 ft length and a 17.5 ft wingspan. A crew of six is required for operations, linked to the Skyeye by 1-2 GHz telemetry. Flight is controlled manually, by an autopilot or is preprogrammed for reference to up to 25 waypoints to satisfy desired heading, altitude, airspeed and sensor commands. The autonomous mode includes the capacity for loiter if the base link is broken, followed by a return to the last known base position after a preset time interval. Previous projects the manufacturer was involved in are summarized to partially describe the climate for producing RPVs during the period of low demand since the end of the Vietnam War. M.S.K.

**A86-36820**
**ARMY COMPLETING DEVELOPMENT TESTS FOR LOCKHEED AQUILA RPV SYSTEM**

Aviation Week and Space Technology (ISSN 0005-2175), vol. 124, April 28, 1986, p. 85-87, 89.

The Aquila RPV is the lead contender in an Army effort to procure an unmanned, miniaturized airborne reconnaissance and laser designating system which is mobile and survivable on a modern battlefield. The Kevlar/epoxy vehicle is 7 ft long, has a wingspan under 13 ft, weighs less than 265 lb. with payload, and can be fitted with an INS for autonomous navigation past preprogrammed waypoints. The maximum of 60 lb. payloads can include a television camera, the laser designator and stabilized optics, and a FLIR for nighttime operations. An antijam capability has been developed for Aquila, which is carried on an Army truck and is caught by a net following flight. The ground crew numbers three personnel. Preliminary tests to prove the production-worthiness of the vehicle have resullted in performances that meet or exceed the requirements, including over 20 min. unattended flight, simultaneous control of two vehicles in flight by the ground station, and 100 percent success at designating moving or stationary targets with the laser apparatus. A 1990 operational status is projected for squadrons of the million dollar Aquilas. M.S.K.

**U. S. ARMY PLANS TO EVALUATE CANADAIR CL-227 SENTINEL**

Aviation Week and Space Technology (ISSN 0005-2175), vol. 124, April 28, 1986, p. 103, 105.

The CL-227 RPV is under development for service in short- to medium-range operations at the brigade level. The 10-ft wingspan CL-227 consists of two spherical modules, powerplant at the bottom and payload at the top, and two 3-bladed counterrotating propellers. The blades have Kevlar skins surrounding foam cores. The vehicle is designed to fly for 3-4 hr, carry a 60-100 lb. payload, travel at up to 70 kt or hover, and climb up to 10,000 ft. The powerplant, furnishing 50 shp and functioning at 100 krpm stepped down to 1 krpm, exhausts upward to mix the exhaust with the downwash and thus to lower the IR signature. Directional changes and flight stability are controlled through low order differential alterations in the propeller speeds. The vehicle is either flown by a joystick handled by the ground crew or can be programmed to take-off and automatically follow waypoints. Landing is automatic once the vehicle is positioned over a designated landing spot. The CL-227 may be used for reconnaissance, decoy, communications relay or ECM applications. M.S.K.

**NORTHROP DELIVERS RPVS TO NAVY TO AID IN DEVELOPMENT PROPOSAL**
Aviation Week and Space Technology (ISSN 0005-2175), vol. 124, April 28, 1986, p. 123, 125, 127.

Deliveries have begun of the BQM-74C target drone reconfigured to serve in reconnaissance applications. The modifications include a nose with a fixed, unstabilized video camera for real-time image transmissions and a 10:1 zoom capability. The camera is equipped with a video cassette for storage when out of telemetry link. A 240-400 n.mi. range is provided, along with flight altitudes of 30-30,000 ft and speeds of 250-500 kt. Video telemetry can be broadcast from 50-70 n.mi., depending on the flight altitude, and the command and control range is 35-50 n.mi. The entire flight of the RPV can be conrolled by an on-board autopilot which can handle speeds, altitudes and maneuvers according to a preprogrammed sequence. The video telemetry is linked to video processors with full storage and playback, real-time and stop-frame capabilities. A larger version of the vehicle is under development to extend the range of use for decoy, reconnaissance, electronic signal intercept, weather data gathering and jamming. M.S.K.

**SIMULATION OF AIRCRAFT COMPONENTS FOR TRAINING PURPOSES**
D. HOWE (Burtek, Inc., Tulsa, OK) IN: Flight simulation/simulators; Proceedings of the Aerospace Technology Conference and Exposition, Long Beach, CA, October 14-17, 1985 . Warrendale, PA, Society of Automotive Engineers, Inc., 1985, p. 51-59.
(SAE PAPER 851965)

A simulation system applied to a primary and secondary flight controls trainer, using nonaircraft commercial parts to teach maintenance and rigging, is presented. Simulation techniques include the use of reduced pressure hydraulics, substitution of electrical drivers and generation of synthetic signals to test equipment. Realism, system functionality and electrical and mechanical interfaces were not compromised, while benefits such as cost savings, schedule improvement and greater safety were derived. It is concluded that all the objectives of using simulated, rather than actual aircraft, components were achieved. K.K.

F. W. BURCHAM, JR., G. A. TRIPPENSEE, D. F. FISHER, and T. W. PUTNAM (NASA, Flight Research Center, Edwards, CA) AIAA, AHS, CASI, DGLR, IES, ISA, ITEA, SETP, and SFTE, Flight Testing Conference, 3rd, Las Vegas, NV, Apr. 2-4, 1986. 32 p. NASA-supported research. refs
(AIAA PAPER 86-9761)

NASA conducted a multidisciplinary flight research program on the F-15 airplane. The program began in 1976 when two preproduction airplanes were obtained from the U.S. Air Force. Major projects involved stability and control, handling qualities, propulsion, aerodynamics, propulsion controls, and integrated propulsion-flight controls. Several government agencies and aerospace contractors were involved. In excess of 330 flights were flown, and over 85 papers and reports were published. This document describes the overall program, the projects, and the key results. The F-15 was demonstrated to be an excellent flight research vehicle, producing high-quality results. Author

**AV-8B HIGH ANGLE OF ATTACK/DEPARTURE RESISTANCE SYSTEM FLIGHT TEST PROGRAM**
R. A. BIGLER (McDonnell Aircraft Co., St. Louis, MO) AIAA, AHS, CASI, DGLR, IES, ISA, ITEA, SETP, and SFTE, Flight Testing Conference, 3rd, Las Vegas, NV, Apr. 2-4, 1986. 9 p.
(AIAA PAPER 86-9729)

The AV-8B High Angle of Attack (HAOA) Test Program used a four phase approach to accomplish the goals within the established time constraints. The major goals were evaluating the HAOA flight characteristics as required by military specification and developing stability augmentation software to enhance the aircraft's maneuvering capability. These goals were accomplished during a thirteen month/251 flight program which incorporated Naval Air Test Center participation flights throughout to eliminate extraneous testing and provide the customer with an early appraisal of the HAOA characteristics. The flight test program concluded with a dedicated spin mode and recovery investigation. The test results defined the maneuvering boundary and indicated the aircraft possessed a high resistance to spin dynamics throughout the normal flight regime. Author

(NASA-TM-87634; L-16065; NAS 1.15:87634) Avail: NTIS HC A04/MF A01 CSCL 01C

The decoupler pylon is a passive wing/store flutter suppression device. It was modified to reduce friction following initial flight tests. A ground vibration test was conducted on an F-16 aircraft loaded on each wing with a one-half-full (center bay empty) 370-gallon fuel tank mounted on a standard pylon, a GBU-8 store mounted on the decoupler pylon, and an AIM-9J missile mounted on a wingtip launcher. The test was conducted prior to flight tests with the modified pylon to determine modal frequencies, mode shapes, and structural damping coefficients. Data presented include frequency response plots, mode shape plots, and limited force-effect plots. Author

**AN ENGINEERING APPROACH TO THE USE OF EXPERT SYSTEMS TECHNOLOGY IN AVIONICS APPLICATIONS**

E. L. DUKE, V. A. REGENIE, M. BRAZEE, and R. W. BRUMBAUGH (PRC Kentron, Edwards, Calif.) May 1986 12 p refs Presented at the IEEE National Aerospace and Electronics Conference (NAECON), Dayton, Ohio, 19-23 May 1986

(NASA-TM-88263; H-1364; NAS 1.15:88263) Avail: NTIS HC A02/MF A01 CSCL 01D

The concept of using a knowledge compiler to transform the knowledge base and inference mechanism of an expert system into a conventional program is presented. The need to accommodate real-time systems requirements in applications such as embedded avionics is outlined. Expert systems and a brief comparison of expert systems and conventional programs are reviewed. Avionics applications of expert systems are discussed before the discussions of applying the proposed concept to example systems using forward and backward chaining. Author

**FIREPROOF HYDRAULIC BRAKE SYSTEM Final Report, 1 Jul. 1983 - 31 Jul. 1985**

D. W. HULING and F. H. HILLMAN Oct. 1985 318 p refs

(Contract F33615-83-C-2322)

(AD-A163542; AFWAL-TR-85-2072) Avail: NTIS HC A14/MF A01 CSCL 01C

The design, development, and manufacture of a flightworthy two-fluid fireproof hydraulic brake system (FHBS) kit for flight testing on a C/KC-135 has been accomplished. The results of system concepts trade studies, the concept selection procedure and rational, component and system design analyses, and component and system testing are summarized herein. The FHBS design selected is a two-fluid concept that uses nonflammable chlorotrifluoroethylene (CTFE) in the high fire-potential area of the brake and landing gear area. The barrier between the CTFE fluid and the MIL-H-5606 hydraulic fluid is a new component; a reservoir/separator. Based on the analysis and laboratory testing, it was concluded that the FHBS design is both flightworthy and has braking performance equivalent to the C/KC-135 brake system for runway/tire friction coefficients of 0.2 to 0.5. It is recommended that the FHBS kit be installed on a C/KC-135 and flight testing be accomplished. Recommendations regarding test conditions and instrumentation for flight testing are included. GRA

**FRAMELESS TRANSPARENCIES FOR AIRCRAFT COCKPIT ENCLOSURES Patent Application**

W. R. PINNELL, inventor (to Air Force) 4 Dec. 1985 18 p refs

(AD-D012155; US-PATENT-APPL-SN-805008) Avail: NTIS HC A02/MF A01 CSCL 01C

This patent application is for a frameless aircraft cockpit enclosure comprising transparent panels of polycarbonate or other plastics of varying thickness and material properties. The edges of the transparent panels are made thicker than the rest of the panels to engage aircraft canopy and windshield arch sections and aircraft sill structures to thus eliminate prior art frames and edge reinforcements. Fibers may be embedded in the thicker edges to add strength. The material properties of the transparent panel may be varied to provide higher static load strength near aircraft sill structures and higher dynamic load strength and plastic behavior near the center of a canopy where bird impact may occur. The material properties of the panel may also be varied to minimize over a pilot's head or near aircraft critical equipment the amplitude of a flexure wave in an aircraft transparency resulting from a bird impact. Direct forming methods, such as injection molding, are discussed as a means for making the frameless aircraft transparencies. GRA

**EXPERIMENTAL ASSESSMENT OF VORTEX RETAINING CAVITY FLAPS FOR MANEUVERABILITY IMPROVEMENT ON DELTA WING FIGHTER AIRCRAFT M.S. Thesis**

H. C. SMITH Dec. 1985 244 p refs

(AD-A164104; AFIT/GAE/AA/85D-13) Avail: NTIS HC A11/MF A01 CSCL 01C

An experimental study was conducted to determine the effectiveness of cavity flaps on delta wing aircraft maneuverability. Cavity flaps are conformal control surfaces deployed in the apex region on the wing's lower surface. A 60 degree swept delta wing model was built and tested in the Air Force Institute of Technology five-foot diameter, subsonic wind tunnel. Ten different cavity flap configurations were tested at deflection angles ranging from 30 degrees to 90 degrees for both asymmetric and symmetric deployments. Coefficients of aerodynamic forces and moments versus angle of attack along with the lift to drag ratio versus lift coefficient and the drag polar were plotted for each flap configuration. The changes to the aerodynamic coefficients produced by adding the cavity flaps were also plotted. Results indicate that for longitudinal, lateral and directional maneuverability, the best cavity flap deflection angle will vary depending on the desired response. Data results also indicated it is best not to have the cavity flap hinge line located along or parallel to the fuselage for rolling and pitching moment considerations. Hinge Line Sweep. GRA

**CONVERSION OF AIR-DATA SYSTEM PRESSURE ERRORS INTO HEIGHT AND SPEED CORRECTIONS**

Nov. 1985 37 p refs

(ESDU-85036; ISBN-0-85679-542-9; ISSN-0141-4054) Avail: ESDU

Approximate formulae for converting errors in pitot and static pressure into corrections to height, Mach number and indicated airspeed are presented as both equations and graphs. The methods give acceptable accuracy for constructing charts or tables of height and speed corrections for flight and operating manuals when pressure errors are not large. Exact methods for correcting speed and height are also included for use when the pressure errors are large, and guidance is included on the correction procedure under nonsteady conditions when any of the errors may depend on the height, Mach number or airspeed. A practical work example illustrates the use of the method. Author

**EVALUATION OF A FREQUENCY RESPONSE TECHNIQUE FOR AIRCRAFT SYSTEM IDENTIFICATION M.S. Thesis Final Report, Feb. 1984 - Oct. 1985**

A. T. REED 31 Oct. 1985 108 p refs

(AD-A164367; AFIT/GAE/AA/85J-2) Avail: NTIS HC A06/MF A01 CSCL 01A

This paper presents the results of a project which used frequency analysis methods applied to flight test data in order to identify aircraft parameters. Computer programs were developed to generate simulated flight test data so the frequency response programs could be tested using a noise free data source. Once the simulated data programs were complete, the frequency response methods were developed. The frequency response method uses the cross-spectral density technique to generate magnitude and phase information. The program also generates the power spectral density functions. Noise contamination studies were made. The programs were used with the test project, HAVE DELAY, which was conducted at the USAF Test Pilot School. The frequency response program worked well up to a frequency of about 15 radians per second. Above 15 radians per second the programs suffer from additional noise and aliasing effects. Recommendations were made to study means of reducing noise effects to include anti-aliasing filters and noise processing schemes for digital data. GRA

**MULTIVARIABLE OUTPUT CONTROL LAW DESIGN FOR THE STOL (SHORT TAKEOFF AND LANDING) F-15 IN LANDING CONFIGURATION M.S. Thesis**

B. H. ACKER Dec. 1985 294 p refs
(AD-A164516; AFIT/GE/ENG/85D-1) Avail: NTIS HC A13/MF A01 CSCL 01B

Using the MULTI computer aided design and simulation program, multivariable, output feedback digital control laws are designed for the F-15 STOL aircraft in the landing configuration. The STOL F-15 landing configuration includes canards and reversible thrust in addition to conventional F-15 control surfaces. The additional controls allow decoupling of the output variables in the longitudinal plane. Longitudinal aircraft dynamics, derived from data provided by the prime contractor, McDonnell-Douglas, are presented in linearized state space form for the design procedure. Control laws are developed to stabilize the aircraft to perform longitudinal landing maneuvers (flight path control and flare) at six flight conditions. The design encompasses actuator dynamics, computational delay, sensor dynamics, sensor noise, and plant nonlinearities. Designs of two of the flight conditions are sufficiently insensitive to plant variations to be used at all but one of the remaining flight conditions. The technique of multivariable output feedback, with the MULTI program provides good robust designs for the STOL F-15. GRA

**DATA ON MI-26 HELICOPTER Abstract Only**

L. CHERNOV *In its* USSR Report: Engineering and Equipment (JPRS-UEQ-86-002) p 7-8 7 Feb. 1986 Transl. into ENGLISH from Kommunist (Moscow, USSR), 19 May 1985 p 4
Avail: NTIS HC A06/MF A01

The MI-26 helicopter, which has the highest payload capacity of any existing helicopter, can transport items that weigh more than 20 tons over long distances in severe climatic conditions. The helicopter is used in the construction of bridges and other structures, and in the delivery and installation of heavy equipment for industrial enterprises and drilling rigs in remote areas. The increased power of the MI-26 was achieved through the use of new materials, structural design, and two economic D-136 gas turbine engines. The design and arrangement of the MI-26 systems make ground maintenance possible without special airfield equipment. An auxiliary power unit ensures the prolonged operation of the helicopter. For mechanization of loading operations, the cargo bay is equipped with two electric winches and a hoisting mechanism which can handle cargo items up to 5 tons each. With a length of 15 meters, the cargo bay can easily hold two trucks or motor buses. B.G.

## AIRCRAFT INSTRUMENTATION

Includes cockpit and cabin display devices; and flight instruments.

**A86-33583*** National Aeronautics and Space Administration. Langley Research Center, Hampton, Va.

**AN AIRBORNE MULTIPLE-BEAM 1.4 GHZ PUSHBROOM MICROWAVE RADIOMETER**

R. F. HARRINGTON and R. W. LAWRENCE (NASA, Langley Research Center, Hampton, VA) IN: 1985 International Geoscience and Remote Sensing Symposium (IGARSS '85), Amherst, MA, October 7-9, 1985, Digest. Volume 2 . New York, Institute of Electrical and Electronics Engineers, Inc., 1985, p. 601-606.

A method is described for providing soil moisture measurements from satellites by performing simultaneous measurements across track (the pushbroom approach). The method has the advantage of obtaining the required swath width without sacrificing sensitivity. A prototype Pushbroom Microwave Radiometer developed at NASA's Langley Research Center is described. It is a multibeam L-Band (1413 MHz) radiometer system providing simultaneous cross track measurements. Results of flight tests onboard a P-3 aircraft are discussed. D.H.

**HIGH RESOLUTION MILLIMETER-WAVE IMAGING SENSOR**

W. J. WILSON, R. J. HOWARD, and G. S. PARKS (California Institute of Technology, Jet Propulsion Laboratory, Pasadena) IN: 1985 International Geoscience and Remote Sensing Symposium (IGARSS '85), Amherst, MA, October 7-9, 1985, Digest. Volume 2 . New York, Institute of Electrical and Electronics Engineers, Inc., 1985, p. 647-649. Army-supported research.

A scanning 3-mm radiometer is described that has been built for use on a small aircraft to produce real time high resolution images of the ground when atmospheric conditions such as smoke, dust, and clouds make IR and visual sensors unusable. The sensor can be used for a variety of remote sensing applications such as measurements of snow cover and snow water equivalent, precipitation mapping, vegetation type and extent, surface moisture and temperature, and surface thermal inertia. The advantages of millimeter waves for cloud penetration and the ability to observe different physical phenomena make this system an attractive supplement to visible and IR remote sensing systems. **HEAD-UP DISPLAY (HUD) UTILITY. II - RUNWAY TO HUD TRANSITIONS MONITORING EYE FOCUS AND DECISION TIMES**

D. J. WEINTRAUB (Michigan, University, Ann Arbor), R. F. HAINES, and R. J. RANDLE (NASA, Ames Research Center, Moffett Field, CA) IN: Human Factors Society, Annual Meeting, 29th, Baltimore, MD, September 29-October 3, 1985, Proceedings. Volume 1 . Santa Monica, CA, Human Factors Society, 1985, p. 615-619.
(Contract NCA2-OR-440-301)

An experiment conducted using a head-up display (HUD) suggests that the demonstrated superiority of the HUD over a conventional instrument panel stems from its superior layout of information. A HUD display presents instrument-panel information to pilots in such a way that the symbols appear as a virtual image at optical infinity superimposed on the landscape. In the experiment conducted, the luminance of the display symbology and its angle subtended at the eye remained fixed, while optical distance and gaze angle were varied. Concomitant measures of eye movements, eye accommodative state, and decision-making time concerning airspeed, altitude and runway condition were obtained. It is found that, while looking straight ahead, at zero diopters, the HUD shortens decision time by 80 to 90 msec, not statistically significant at the 0.05 (slope of diopter/gaze interaction) level. The question of a cognitive overload induced by the luminous symbols of the HUD is subsequently addressed. K.K.

### STUDIES ON TURNING ERRORS OF THE MAGNETIC COMPASS IN FLIGHT EXPERIMENTS

T. HIDESHIMA Japan Society for Aeronautical and Space Sciences, Journal (ISSN 0021-4663), vol. 34, no. 385, 1986, p. 74-80. In Japanese, with abstract in English. refs

To clarify the behavior of turning errors of the magnetic compass, many turns are conducted from various courses by the trainers of Civil Aviation College. In turning to the right, the maximal lag error of the compasss occurs between the heading of 10 and 40 deg, and the maximal lead error occurs between the heading of 130 and 160 deg. The extent of the maximal error depends upon the angle of aircraft bank. An angle of bank has the greatest effect on compass errors among the flight characteristics of an aircraft. The effect of flying speed, the time rate of bank and flying altitude are investigated. The results of flight experiments agree quite well with those of computing errors through Lindemann's procedure. As a result of the studies, turning error curve is proposed. The computed turning error curves to one angle of bank are almost the same for the compasses used today. This curve can be applied to any turning by using the magnetic compass. Author

### WEIGHT ASSESSMENT OF ELECTRONIC BOXES

L. A. HARTLEY and O. HANREITER (Boeing Military Airplane Co., Wichita, KS) Society of Allied Weight Engineers, Annual Conference, 44th, Arlington, TX, May 20-22, 1985. 37 p. (SAWE PAPER 1661)

The present paper is concerned with the prediction and assessment of the weights of electronic boxes on a new aircraft. A statistical basis is provided for the evaluation of weights of electronic boxes, taking into account the use of simple parameters which are universally available. The Offensive and Defensive System avionics developed for the B-1 bomber program provide a sufficiently large data base to permit development of a statistical basis for evaluating electronic box weights. It is found that a distinct electronic box, which is called a Line Replaceable Unit (LRU), can undergo tremendous weight growth. Attention is given to a data base description, LRU construction, aspects of program phasing and milestones, sources of uncertainty for new hardware, sources of uncertainty for off-the-shelf hardware, statistical data, probability curves defined, parameters defined, probability of LRU weight growth, LRU weight density probability, a weight quality history, and aspects of data application. G.R.

### A PRELIMINARY STUDY OF THE BASIC DISPLAY/GUIDANCE REQUIREMENTS FOR FLYING NEAR OPTIMAL TRAJECTORIES

D. D. VICROY (NASA, Langley Research Center, Hampton, VA) IN: 1985 American Control Conference, 4th, Boston, MA, June 19-21, 1985, Proceedings. Volume 2 . New York, Institute of Electrical and Electronics Engineers, 1985, p. 669-674. refs

NASA has responded to the increased emphases on cost-efficient operation of today's airline fleet with an ongoing research program to investigate the requirements and benefits of using new airborne guidance and pilot procedures designed to yield cost-optimal flight profiles that are compatible with advanced air traffic control system concepts. A trajectory optimization algorithm has been incorporated into one of NASA Langley's fixed-based simulators to investigate the pilot/cockpit interface requirements. The trajectories that are generated by this algorithm differ from conventional profiles in that they are constantly varying in both flight path angle and airspeed. Considering the dynamic nature of these profiles, conventional guidance may be insufficient for practical use. This paper summarizes the results of an initial set of piloted simulation tests to investigate the basic guidance requirements for flying the near-optimal trajectories. Author

### COMPUTER-AIDED COCKPIT WORKLOAD ANALYSIS FOR ALL WEATHER, MULTIROLE TACTICAL AIRCRAFT

B. B. ROBERTS (Computer Sciences Corp., Edwards AFB, CA) and C. D. CRITES (USAF, Flight Test Center, Edwards AFB, CA) IN: Aerospace Behavioral Engineering Technology Conference, 4th, Long Beach, CA, October 14-17, 1985, Proceedings . Warrendale, PA, Society of Automotive Engineers, Inc., 1985, p. 111-123. (SAE PAPER 851876)

The development of computer-aided cockpit workload analysis that predicts man/machine interface problems is discussed. The logic flow for the Timebased Analysis of Significant Coordinated Operations (TASCO) model is described. The components and procedures of the crew station task analysis and busy rate index analysis performed by the TASCO model are examined. Computer-aided testing is applied to the TASCO model to establish pass/fail criteria associated with operator task performance profficiency. I.F.

**A86-35606**

### STORED TERRAIN DATA BASE AIDED PILOTAGE FOR HELICOPTERS

N. C. SEILER and J. A. GRACIA (Harris Corp., Harris Government Aerospace Systems Div., Melbourne, FL) IN: American Helicopter Society, Annual Forum, 41st, Fort Worth, TX, May 15-17, 1985, Proceedings . Alexandria, VA, American Helicopter Society, 1985, p. 101-109. refs

A panoramic pilotage display, enhanced by a topographical data base, can significantly improve military helicopter pilot efficiency while reducing workloads. The basic task of geographic orientation is automated through the provision of a planview map with tactical symbology on a head-down display. The stored data base required allows for a look-ahead capability from topographical cover positions; this is especially useful when presented in a perspective format on the head-down display. A system of this type is applicable to the U.S. Army's next-generation 'LHX' single-crewmember combat helicopter. O.C.

**A86-35650**

### AN AVIONICS SOFTWARE TEST AND EVALUATION TECHNIQUE

T. B. PRIEST, JR. and B. P. DOUGLASS (Bell Helicopter Textron, Fort Worth, TX) IN: American Helicopter Society, Annual Forum, 41st, Fort Worth, TX, May 15-17, 1985, Proceedings . Alexandria, VA, American Helicopter Society, 1985, p. 661-664.

Quality control must be ensured for advanced helicopter avionics systems requiring complex software for the performance of a variety of tasks; attention is presently given to a four-phase software testing method of this type. The phases are: (1) individual software module testing; (2) testing of the complete program constructed from the linked modules; (3) real time, manned tests with simulated inputs; and (4) flight testing. O.C.

**INTEGRATED AVIONICS SUITE AS IMPLEMENTED ON THE AGUSTA A-129**

K. E. FARSON (Harris Corp.; Government Aerospace Systems Div., Melbourne, FL) AHS, Annual Forum and Technology Display, 41st, Fort Worth, TX, May 15-17, 1985, Paper. 12 p.

The integrated avionics suite implemented on the Agusta A-129 attack helicopter is described. The integrated Multiplex System (IMS), performing all of the on-board subsystem management, processing, data transfer, display, and control is the main asset of the craft, with features including pilot and copilot multimode displays, dual redundant mission processors, dual MIL-STD-1553B data bus network, electrical power management through solid-state power controllers, and modular software. Implementation of IMS into the helicopter meant a reduction in the number of required LRUs, lower total system weight, incrased reliability, and improved performance. The extremely flexible system architecture allows for changes and growth. I. S.

**ADVANCED BOUNDARY LAYER TRANSITION MEASUREMENT METHODS FOR FLIGHT APPLICATIONS**

B. J. HOLMES, C. C. CROOM, P. D. GAIL, G. S. MANUEL, and D. L. CARRAWAY (NASA, Langley Research Center, Hampton, VA) AIAA, AHS, CASI, DGLR, IES, ISA, ITEA, SETP, and SFTE, Flight Testing Conference, 3rd, Las Vegas, NV, Apr. 2-4, 1986. 14 p. refs

(AIAA PAPER 86-9786)

In modern laminar flow flight research, it is important to understand the specific cause(s) of laminar to turbulent boundary-layer transition. Such information is crucial to the exploration of the limits of practical application of laminar flow for drag reduction on aircraft. The transition modes of interest in current flight investigations include the viscous Tollmien-Schlichting instability, the inflectional instability at laminar separation, and the crossflow inflectional instability, as well as others. This paper presents the results to date of research on advanced devices and methods used for the study of laminar boundary-layer transition phenomena in the flight environment. Recent advancements in the development of arrayed hot-film devices and of a new flow visualization method are discussed. Arrayed hot-film devices have been designed to detect the presence of laminar separation, and of crossflow vorticity. The advanced flow visualization method utilizes color changes in liquid-crystal coatings to detect boundary-layer transition at high altitude flight conditions. Flight and wind tunnel data are presented to illustrate the design and operation of these advanced methods. These new research tools provide information on disturbance growth and transition mode which is essential to furthering our understanding of practical design limits for applications of laminar flow technology. **THE SUPERPOSITION DISTORTION INDEX**

T. ABE Japan Society for Aeronautical and Space Sciences, Journal (ISSN 0021-4663), vol. 34, no. 385, 1986, p. 97-106. In Japanese, with abstract in English. refs

In this paper, a superposition distortion index KA2 is introduced to indicate the relationship between the distortion intensity and the fan speed. The data to calulate the KA2 was obtained by the distortion experiments using the two stages axial flow fan and distortion screens. A number of conventional distortion indices such as Kra2, DI, Dmin, K-theta, KD2, and DC60 are presented to evaluate the each radial and circumferential distortion intensity. In a previous paper, both radial and circumferential distortion indices were expressed in one figure to evaluate the distortion intensity more accurately. This method, however, cannot tell the influence of the fan speed. The index KA2 includes the radial distortion index Kra2 and the circumferential distortion index K-theta, the

influence of fan speed. The influence of fan speed was obtained from the stall margin decrease of the fan chracteristics curves.

**GAIN-SCHEDULED MULTIVARIABLE COTNROL FOR THE GE-21 TURBOFAN ENGINE USING THE LQG/LTR METHODOLOGY**

P. KAPASOURIS, M. ATHANS, and H. A. SPANG, III (MIT, Cambridge, MA) IN: 1985 American Control Conference, 4th, Boston, MA, June 19-21, 1985, Proceedings. Volume 1 . New York, Institute of Electrical and Electronics Engineers, 1985, p. 109-118. Research supported by the General Electric Co. refs

This paper presents a feasibility study related to the design of a global nonlinear multivariable compensator for a model of the GE-21 double-bypass variable cycle jet engine. The nonlinear engine dynamics are linearized at nine distinct operating conditions. Scaling of variable units and Singular Value Decomposition at DC identified the subset of controls and outputs for dynamic control. At each operating condition an LQG/LTR compensator is designed; the parameters of the LQG/LTR compensator are then scheduled to produce a global dynamic compensator. Transient simulations are included to illustrate the characteristics of the nonlinear multivariable control system. Author

**APPLICATION OF FDI METRICS TO DETECTION AND ISOLATION OF SENSOR FAILURES IN TURBINE ENGINES**

J. L. WEISS, A. S. WILLSKY, K. R. PATTIPATI, and J. S. ETERNO (Alphatech, Inc., Burlington, MA) IN: 1985 American Control Conference, 4th, Boston, MA, June 19-21, 1985, Proceedings. Volume 2 . New York, Institute of Electrical and Electronics Engineers, 1985, p. 1114-1120. refs
(Contract NAS3-24078)

This paper develops a framework for the design of failure detection and isolation (FDI) algorithms. Rather than trying to apply 'optimal' techniques in a top-down manner, the system redundancies are evaluated with respect to their ability to provide reliable FDI information. Previous work of Pattipati et al. (1984) and Weiss et al. (1984) defined a useful context and several useful analytical results, which provide a basis for the FDI design methodology developed here. A general decision structure which can take advantage of redundancy evaluation is presented, and examples of typical design considerations are discussed. The operation of the decision structure is then demonstrated for a sensor FDI application involving the F-100 jet engine. Author

**ROBUST DETECTION, ISOLATION, AND ACCOMMODATION FOR SENSOR FAILURES**

A. EMAMI-NAEINI, M. M. AKHTER, and S. M. ROCK (Systems Control Technology, Inc., Palo Alto, CA) IN: 1985 American Control Conference, 4th, Boston, MA, June 19-21, 1985, Proceedings. Volume 2 . New York, Institute of Electrical and Electronics Engineers, 1985, p. 1129-1134. refs
(Contract NAS3-24079)

Recent advances in multivariable robust control system design are extended to sensor failure, detection, isolation, and accommodation (FDIA) and estimator design. A new concept called threshold selector is introduced. It represents a significant and innovative tool for the analysis and synthesis of FDIA algorithms. Analytical results are obtained for the SISO case to compute optimal thresholds and size of minimum detectable failures, and a computer-aided technique is developed for the multivariable case. The techniques have been applied to sensor FDIA for an aircraft turbine engine control system. Author

**BIFURCATION TECHNIQUES FOR NONLINEAR DYNAMIC ANALYSIS OF COMPRESSOR STALL PHENOMENA**

H. C. RAZAVI and R. K. MEHRA (Scientific Systems, Inc., Cambridge, MA) IN: 1985 American Control Conference, 4th, Boston, MA, June 19-21, 1985, Proceedings. Volume 2 . New York, Institute of Electrical and Electronics Engineers, 1985, p. 1135-1142. refs
(Contract NAS3-24089; NSF CEE-81-00491)

Compressor stall phenomena is analyzed from nonlinear control theory viewpoint, based on bifurcation-catastrophe techniques. This new approach appears promising and offers insight into such well known compressor instability problems as surge and rotating stall; furthermore it suggests strategies for recovery from stall. Three interlocking dynamic nonlinear state space models are developed. It is shown that the problem of rotating stall can be viewed as an (induced) bifurcation of solution of the unstalled model. Hysteresis effect is shown to exist in the stall/recovery process. Surge cycles are observed to develop for some critical parameter values. It is shown that the oscillatory behavior is due to development of limit cycles, generated by Hopf bifurcation of solutions. Both stable and unstable limit cycles are observed. To further illustrate the usefulness of the methodology some partial computation of domains of attraction of equilibria is carried out, and parameter sensitivity analysis is performed. Author

**SYNTHESIS OF SYSTEM RESPONSES - A NONLINEAR MULTIVARIABLE CONTROL DESIGN APPROACH**

J. L. PECZKOWSKI (Allied-Bendix Aerospace, Bendix Energy Controls Div., South Bend, IN) and M. K. SAIN (Notre Dame, University, IN) IN: 1985 American Control Conference, 4th, Boston, MA, June 19-21, 1985, Proceedings. Volume 3 . New York, Institute of Electrical and Electronics Engineers, 1985, p. 1181-1186. refs
(Contract NAS2-11877)

A unique feedback controller structure using coordinated feedforward and feedback dynamics is presented, with emphasis on the application aspects of system response. The control approach linearizes the plant at a finite number of points over the envelope of operation, applies linear transfer synthesis techniques about each point to obtain desired output responses and acceptable control responses, and systematically links and schedules all local designs together into a global design over the envelope as a function of key plant variables within a broad nonlinear design strategy. The synthesis is illustrated by the design of nonlinear control systems for a turbojet engine. B.J.

**PRACTICAL DIAGNOSTICS OF AIRCRAFT GAS TURBINES [PRAKTICHESKAIA DIAGNOSTIKA AVIATSIONNYKH GAZOTURBINNYKH DVIGATELEI]**
L. P. LOZITSKII, V. P. STEPANENKO, V. A. STUDENIKIN, V. F. LAPSHOV, M. D. AVDOSHKO et al. Moscow, Izdatel'stvo Transport, 1985, 104 p. In Russian. refs

The methods and equipment used in the testing and troubleshooting of aircraft gas turbines are reviewed. In particular, attention is given to the principal types of faults and malfunctions and their diagnostic parameters; detectability of faults; and the organizational and technical aspects of diagnostic support. The discussion also covers particular diagnostic techniques based on flight data, vibration parameters, thermogasdynamic parameters, and wear products accumulating in oil. Finally, the automation of testing and troubleshooting and future prospects in this field are discussed. V.L.

**APPLICATION OF CFD DESIGN TECHNOLOGY IN DEVELOPMENT OF THE JVX ENGINE INLET**
G. C. PAYNTER, J. L. KONCSEK (Boeing Military Airplane Co., Seattle, WA), B. TURCZENIUK (Boeing Vertol Co., Philadelphia, PA), D. R. CLARK, and D. J. STRASH (Analytical Methods, Inc., Bellevue, WA) IN: American Helicopter Society, Annual Forum, 41st, Fort Worth, TX, May 15-17, 1985, Proceedings . Alexandria, VA, American Helicopter Society, 1985, p. 163-174. refs

A joint services program is underway to develop a tilt rotor vertical lift aircraft, the V-22 Osprey, previously the JVX, for amphibious assault, combat search and rescue, special operations and electronic warfare. The engine inlets for this aircraft must supply air to the engines with high recovery and low distortion under all operational modes without an increase in overall aircraft drag at cruise due to inlet flow spillage. In addition, the inlet must prevent sand ingested into the inlet from passing through the engine. This paper describes the CFD based design procedure which was used to configure the engine inlet and the wind tunnel testing which was used to validate the design. Wind tunnel tests confirmed that the inlet would meet or exceed its performance goals. Author

W. H. PFEIL, G. DE LOS REYES (General Electric Co., Aircraft Engine Business Group, Lynn, MA), and G. A. BOBULA (NASA, Lewis Research Center; U.S. Army, Propulsion Laboratory, Cleveland, OH) IN: American Helicopter Society, Annual Forum, 41st, Fort Worth, TX, May 15-17, 1985, Proceedings . Alexandria, VA, American Helicopter Society, 1985, p. 189-196. refs
(Contract NAS3-22763)

A power turbine governor was designed for a recent-technology turboshaft engine coupled to a modern, articulated rotor system using Linear Quadratic Regulator (LQR) and Kalman Filter (KF) techniques. A linear, state-space model of the engine and rotor system was derived for six engine power settings from flight idle to maximum continuous. An integrator was appended to the fuel flow input to reduce the steady-state governor error to zero. Feedback gains were calculated for the system states at each power setting using the LQR technique. The main rotor tip speed state is not measurable, so a Kalman Filter of the rotor was used to estimate this state. The crossover of the system was increased to 10 rad/s compared to 2 rad/sec for a current governor. Initial computer simulations with a nonlinear engine model indicate a significant decrease in power turbine speed variation with the LQR governor compared to a conventional governor. Author

(Contract DAAK51-83-C-0038)

Closed loop bench tests, 250-C30 engine tests, man-in-the-loop S76 simulator sessions, and 206L helicopter flight tests, are being conducted as part of a U.S. Army program for the evaluation of full authority digital engine control-implemented concepts. The adaptive control laws encompass engine start sequence variation as a function of speed and acceleration, sensing of compressor discharge pressures, measuring engine deceleration rates, adding torsional mode damping to the rotor drive-train, and sensing rotor speed decay rate. Test results indicate that substantial engine and helicopter performance paybacks are achieved with these control features. O.C.

**VIBRATION CHARACTERISTICS OF AIRCRAFT ENGINE-BLADED-DISK ASSEMBLY**
J. S.J RAO, C. B. SHAH, CH. L. GANESH (Indian Institute of Technology, New Delhi, India), and Y. V. K. S. RAO (Indian Space Research Organization, Vikram Sarabhai Space Centre, Trivandum, India) Defence Science Journal (ISSN 0011-748X), vol. 36, Jan. 1986, p. 9-26. Research supported by the Defence Ministry. refs

This paper is concerned with the vibration characteristics of a gas-turbine blade-disk assembly and a third stage of compressor blade-disk assembly of an orpheus aircraft engine. The assembly is analyzed by considering each component individually and then combining them together with a receptance coupling technique by matching forces and displacements at each junction point. The blade is modeled by number of free-free aerofoil section beams staggered at different angles to the plane of the disk, and the nonuniform disk is modeled as number of concentric annuli. The natural frequencies and mode shapes for each case have been obtained. Results obtained are verified by testing both the above assemblies on a microprocessor based vibration exciter and real time analyzer. The mode shape corresponding to each natural frequency was obtained by probing with hand held accelerometer Author

**LIMITING VALUES OF THE SPECIFIC PARAMETERS OF A RAMJET ENGINE [O PREDEL'NYKH ZNACHENIIAKH UDEL'NYKH PARAMETROV PVRD]**
V. I. BAZHANOV and A. A. STEPCHKOV Aviatsionnaia Tekhnika (ISSN 0579-2975), no. 4, 1985, p. 77, 78. In Russian.

The parameters of a ramjet engine using a supersonic diffuser with 2, 3, and 4 shock waves are calculated in the Mach number range 4-8. It is shown that the engine parameters are improved with increasing flight velocity, this effect being particularly pronounced in the range Mach 4-6; only a slight improvement is observed at Mach greater than 6. An increase in the number of shock waves in the diffuser above three does not change the specific thrust or specific fuel consumption by more than 5 percent. V.L.

**AIRCRAFT ENGINE TECHNOLOGY WINDOWS (LECTURE)**
B. H. ROWE (General Electric Co., Aircraft Engine Business Group, Cincinnati, OH) Aerospace (UK) (ISSN 0305-0831), vol. 13, April 1986, p. 23-27.

The success or failure of a manufacturing company depends on the ability to recognize technological windows, a confluence of developments which can be exploited to realize a successful product. New propulsion systems are the key to smaller, lighter, lower-cost, higher efficiency aircraft aircraft. Improvements are largely made with refinements of existing technologies, those for which capital investments in plant can be amortized over sufficiently short periods of time. In R&D, attention is currently focused on unducted fans (UDF) for subsonic flight, augmented turbo fans for supersonic flight, and combinations of the airbreathing engines and rocket power for military and commercial hypersonic flight. The UDF, as NASA tests have shown, offers a potential 25 percent greater efficiency than current turbofans due to less a high SFC and diameter and weight reductions from counterrotating configurations. Substantial materials properties improvements, along with new fuels, are needed to satisfy the requirements for future supersonic (up to Mach 4.0) aircraft. Hypersonic vehicles will need acceleration more than cruise, combined cycle, variable thrust operation, and reusability. A database is now being accumulated on relevant past efforts as a prelude to studies of hypersonic vehicle propulsion systems. M.S.K.

**SURVEY OF SUPERSONIC COMBUSTION RAMJET RESEARCH AT LANGLEY**
G. B. NORTHAM and G. Y. ANDERSON (NASA, Langley Research Center, Hampton, VA) AIAA, Aerospace Sciences Meeting, 24th, Reno, NV, Jan. 6-9, 1986. 27 p. refs
(AIAA PAPER 86-0159)

The Hypersonic Propulsion Branch at NASA Langley Research Center has maintained an active research program in supersonic combustion ramjet (scramjet) and high speed ramjet propulsion since the 1960s. The focus for this research has centered on propulsion for manned reuseable vehicles with cryogenic hydrogen fuel. This paper presents some highlights of this research. The design philosophy of the Langley fixed-geometry airframe-integrated modular scramjet is discussed. The component development and research programs that have supported the successful demonstration of the engine concept using subscale engine module hardware is reviewed and a brief summary of the engine tests presented. An extensive bibliography of research supported by the Langley program is also included. Author

**FRONT-LINE POWER**
J. MOXON Flight International (ISSN 0015-3710), vol. 129, April 12, 1986, p. 22-26.

The types of fighter aircraft engines manufactured by western nations are described, along with developmental goals to meet the requirements of new generations of fighter aircraft. In all cases government orders are the sole accounts of the manufacturers. Development is usually paid for by the government(s) ordering the engines. The F100, F110 and F404 engines are the only engines for the F-14, -15, -16, and -18 aircraft, with the government frequently encouraging competition for replacement engines from General Electric (GE) and Pratt and Whitney (PW), the only domestic suppliers. In Europe, SNECMA is frequently the only supplier for the Mirage 2000 engine. Rolls Royce, the only other European manufacturer, produces the RB.199, Mk 104 and Mk 103 engines for use in the Toronado. GE and PW are both developing Increased Performance Engines (IPE) for the USAF. The IPEs are expected to be installed in aircraft in 1990. The Joint Advanced Fighter Engine (Jafe), to produce 30,000-35,000 lb. thrust, 75 percent without afterburner, is requiring research on reducing the IR signature and employing composite parts. European engines under development are the XG-40, the M88, the M53, and the European Fighter Engine (EFA). Prime requirements for new engines for the USAF are substantially increased availability and increased performance. M.S.K.

(AD-A133968; AGARD-AR-182(FR); ISBN-92-835-2110-2) Avail: NTIS HC A09/MF A01 CSCL 21E

The averaging techniques used for nonuniform internal flow of gas turbine systems, in which the actual flows are usually heterogeneous and three-dimensional was studied. The test analysis and performance prediction methods are based upon simple one-dimensional models. Current practices were reviewed and a theoretical analysis of the relations which may be correctly applied to steady flow was undertaken and known averaging methods were classified. Refinements to known methods and a new approach to averaging for use with engine components and propulsion system analysis are proposed. A variety of possible averaging techniques are identified and compared by preparing a number of sample calculations in ducted flows, turbojet components and a complete propulsion system. The merits and the limitations of the methods studied are outlined. One method is recommended for stagnation temperature averaging. E.A.K.

(NASA-TP-2557; E-2771; NAS 1.60:2557) Avail: NTIS HC A04/MF A01 CSCL 21E

A test program was conducted to determine the aerodynamic performance and acoustic characteristics associated with the low-speed operation of a supersonic, axisymmetric, mixed-compression inlet with auxiliary inlets. Blow-in-auxiliary doors were installed on the NASA Ames P inlet. One door per quadrant was located on the cowl in the subsonic diffuser selection of the inlet. Auxiliary inlets with areas of 20 and 40 percent of the inlet capture area were tested statically and at free-stream Mach numbers of 0.1 and 0.2. The effects of boundary layer bleed inflow were investigated. A JT8D fan simulator driven by compressed air was used to pump inlet flow and to provide a characteristic noise signature. Baseline data were obtained at static free-stream conditions with the sharp P-inlet cowl lip replaced by a blunt lip. Auxiliary inlets increased overall total pressure recovery of the order of 10 percent. Author

An improved high pressure turbine rotor blade and tip cap structure is provided which comprises a tip end closure for the blade bonded to the end wall of the blade casting. It includes a base plate member and a pair of upstanding side walls defining a peripheral contour coincidental with and faired to the cambered side walls of the casting. The base plate member has a plurality of radially outwardly opening passageways through it and disposed along the chord of the blade and communicating with a channel included in the radially outwardly facing surface of the casting along a chord of the blade. The passageways are disposed along axes at angles to the base plate whereby coolant fluid flowing through it is directed against the tip side wall surfaces. An opening is provided through the end wall of the casting in the form of a slit or a plurality of holes along the chord of the blade and intersecting the channel, to define an outlet through the end wall for passage of coolant fluid through the blade. **FLIGHT TESTING THE DIGITAL ELECTRONIC ENGINE CONTROL IN THE F-15 AIRPLANE**
L. P. MYERS *In its* Digital Electronic Engine Control (DEEC) Flight Evaluation in an F-15 Airplane p 91-105 Mar. 1984
(PAPER-6) Avail: NTIS HC A11/MF A01 CSCL 21E

The digital electronic engine control (DEEC) is a full-authority digital engine control developed for the F100-PW-100 turbofan engine which was flight tested on an F-15 aircraft. The DEEC hardware and software throughout the F-15 flight envelope was evaluated. Real-time data reduction and data display systems were implemented. New test techniques and stronger coordination between the propulsion test engineer and pilot were developed which produced efficient use of test time, reduced pilot work load, and greatly improved quality data. The engine pressure ratio (EPR) control mode is demonstrated. It is found that the nonaugmented throttle transients and engine performance are satisfactory.

(PAPER-7) Avail: NTIS HC A11/MF A01 CSCL 21E

The capabilities and performance of various fault detection and accommodation (FDA) schemes in existing and projected engine control systems were investigated. Flight tests of the digital electronic engine control (DEEC) in an F-15 aircraft show discrepancies between flight results and predictions based on simulation and altitude testing. The FDA methodology and logic in the DEEC system, and the results of the flight failures which occurred to date are described.

The digital electronic engine control (DEEC) system installed on an F100 engine in an F-15 aircraft was tested. The DEEC system incorporates a closed-loop air start feature in which the fuel flow is modulated to achieve the desired rate of compressor acceleration. With this logic the DEEC equipped F100 engine can achieve air starts over a larger envelope. The DEEC air start logic, the test program conducted on the F-15, and its results are described.

The backup control (BUC) features, the operation of the BUC system, the BUC control logic, and the BUC flight test results are described. The flight test results include: (1) transfers to the BUC at military and maximum power settings; (2) a military power acceleration showing comparisons bvetween flight and simulation for BUC and primary modes; (3) steady-state idle power showing idle compressor speeds at different flight conditions; and (4) idle-to-military power BUC transients showing where compressor stalls occurred for different ramp rates and idle speeds. All the BUC transfers which occur during the DEEC flight program are initiated by the pilot. Automatic transfers to the BUC do not occur.

(PAPER-10) Avail: NTIS HC A11/MF A01 CSCL 21E

The air start capability of a backup control (BUC) was tested for a digital electronic engine control (DEEC) equipped F100 engine, which was installed in an F-15 aircraft. Two air start schedules were tested. Using the group 1 start schedule, based on a 40 sec timer, an air speed of 300 knots was required to ensure successful 40 and 25% BUC mode spooldown airstarts. If core rotor speed (N2) was less than 40% a stall would occur when the start bleed closed, 40 sec after initiation of the air start. All jet fuel starter (JFS) assisted air starts were successful with the group 1 start schedule. For the group 2 schedule, the time between pressurization and start bleed closure ranged between 50 sec and 72 sec. Idle rps was lower than the desired 65% for air starts at higher altitudes and lower air speeds.

An F100 augmented turbofan engine equipped with digital electronic engine control (DEEC) system was evaluated. The engine was equipped with a specially modified augmentor to provide improved steady state and transient augmentor capability. The combination of the DEEC and the modified augmentor was evaluated in sea level and altitude facility tests and then in four different flight phases in an F-15 aircraft. The augmentor configuration, logic, and test results are presented.

(PAPER-12) Avail: NTIS HC A11/MF A01 CSCL 21E

An instability in the nozzle of the F100 engine, equipped with a digital electronic engine control (DEEC), was observed during a flight evaluation on an F-15 aircraft. The instability occurred in the upper left hand corner (ULMC) of the flight envelope during augmentation. The instability was not predicted by stability analysis, closed-loop simulations of the the engine, or altitude testing of the engine. The instability caused stalls and augmentor blowouts. The nozzle instability and the altitude testing are described. Linear analysis and nonlinear digital simulation test results are presented. Software modifications on further flight test are discussed.

(PAPER-14) Avail: NTIS HC A11/MF A01 CSCL 21E

The need for a more sophisticated engine control system is discussed. The improvements in better thrust-to-weight ratios demand the manipulation of more control inputs. New technological solutions to the engine control problem are practiced. The digital electronic engine control (DEEC) system is a step in the evolution to digital electronic engine control. Technology issues are addressed to ensure a growth in confidence in sophisticated electronic controls for aircraft turbine engines. The need of a control system architecture which permits propulsion controls to be functionally integrated with other aircraft systems is established. Areas of technology studied include: (1) control design methodology; (2) improved modeling and simulation methods; and (3) implementation technologies. Objectives, results and future thrusts are summarized.

**DAMAGE TOLERANCE CONCEPTS FOR CRITICAL ENGINE COMPONENTS**
R. H. JEAL *In* AGARD Damage Tolerance Concepts for Critical Engine Components 12 p Oct. 1985 refs
Avail: NTIS HC A13/MF A01

The cost of failures in gas turbines has always been so high, both in human and financial terms, that it has been recognized since the earliest days that the behavior of components had to be fully characterized before the engines were used in service. The integrity of the gas turbine has therefore always been based upon two separate phases of development. The first has been the basic design itself where, as well as ensuring that the individual components meet their basic mechanical purpose, the designer attempts to match his understanding of the operating conditions to his perception of the capability of material chosen. The second has been the development phase where the actual behavior of the component has been assessed either as part of an operating engine - bench engine testing or as an individual component - rig testing - under conditions which are related to those the engine is expected to see in service. The results of this work are then used, together with prior experience, to identify the critical components of the engine, those that prejudice the safety of the aircraft if they fail. The development of damage tolerance concepts is traced from the earliest days, the current situation is examined in light of design needs and available technology, and possible directions are examined.

Research on gas turbine engine development during the past decade in NATO nations has concentrated heavily on gaining better understanding of the relationship between material characteristics, failure mechanisms, structural analysis and validation testing for increased service life. Recognizing this intense interest and activity level the Propulsion and Energetics Panel (PEP) sponsored a specialists' meeting that surveyed the state-of-art technical areas related to improving engine life and considered the technical and economical problems and possibilities of advanced cyclic testing in the development of engines. Discussions focused on relationships between engine use and failure modes, accelerated mission testing (AMT) development, critical material characteristics, component life assessment methods, recent results of component and engine cyclic testing, and future requirements. Avail: NTIS HC A13/MF A01

An automated NDE inspection system to detect surface flaws and inclusions in jet engine rotary parts was developed. The system implements the Air Force Retirement for Cause philosophy in which good, used engine parts are returned to service, and flawed components are retired for cause. Emphasis has thus been placed on improving current flaw detection and characterization techniques by using computer algorithms (removing the human decision process) and achieving basic inspection and predictive capabilities via automated eddy current and ultrasonic inspection techniques. Avail: NTIS HC A13/MF A01

In recent years a strong interest in the application of damage tolerance techniques for lifing of gas turbine engine discs has developed. Before the damage tolerance approach can be safely implemented it requires sensitive and reliable crack detection techniques, operational loading information and improved knowledge of fatigue crack growth and fracture under service conditions. This latter aspect is the main subject of an international test program, in which a number of laboratories from North America and Europe participate under AGARD coordination. The first phase of the program is directed to test and specimen standardization and calibration of the different laboratories. The second phase will specifically address parameters relevant for real service operation like mission loading, sequence and dwell effects, temperature, fatigue threshold, etc. The background and first phase of the program are discussed. **FRACTURE MECHANICS AND LCF-PROPERTIES OF ENGINE DISCS OF TI 6AL-4V, INCONEL 718 AND UDIMET 700 P/M-HIP**

W. SCHUETZ and R. HEIDENREICH *In* AGARD Damage Tolerance Concepts for Critical Engine Components 13 p Oct. 1985 refs

Avail: NTIS HC A13/MF A01

Over the last decade IABG has carried out a large number of tests on gas turbine materials to determine the materials data necessary for the conventional lifing approach, that is LCF data, including dwell time effects and some HCF data. The data necessary for a damage tolerance approach as well as crack propagation properties were also determined. These tests were done at room and typical service temperatures. The materials were Ti 6A1 4V, Inconel 718 and Udimet 700 P/M-HIP. The specimens were machined from a number of nominally identical compressor discs of Ti A16 V4, from compressor discs of Inconel 718 and from disc-shaped 'pancakes' of Udimet 700 P/M-HIP. Constant amplitude tests under strain control with unnotched specimens and under stress control with notched specimens were carried out, as well as a number or relatively simple variable amplitude tests. **EVALUATION OF CYCLIC SPIN PIT TESTS FOR THE DAMAGE TOLERANCE OF DISKS**

H. HUFF and G. W. KOENIG *In* AGARD Damage Tolerance Concepts for Critical Engine Components 13 p Oct. 1985 refs

Avail: NTIS HC A13/MF A01

In order to determine the damage tolerance at critical areas of nickelbase engine disks (bore, eccentric hole, blade slot) the crack propagation behavior was investigated. The experiments include cyclic spin pit tests on disks and fracture mechanics tests on small crack specimens. The results of the spin pit tests are compared with the crack propagation behavior predicted by fracture mechanics. The tolerance of engine disks with respect to small crack-like defects is estimated and the potential of the crack propagation life for application in service is discussed. It was found that at low and intermediate temperatures the crack propagation life is sufficient to cover a substantial portion of the life required for disks. With increasing temperature the influence of time dependent processes results in a very strong reduction of the defect tolerance. Author

**ON THE VERTICAL TURNS SUSTAINING CORNER VELOCITY**

K. KATO (Tokyo, University, Japan) and S. UENO (Toshiba Co., Ltd., Kawasaki, Japan) (Japan Society for Aeronautical and Space Sciences, Annual Conference, 15th, Tokyo, Japan, Apr. 1984) Japan Society for Aeronautical and Space Sciences, Transactions (ISSN 0549-3811), vol. 28, Feb. 1986, p. 175-184. refs

Minimum time pull-up maneuvers in the vertical plane are formulated and solved numerically as an optimal control problem. Restrictions due to thrust, load factor and angle of attack (or stall) are involved as the inequality constraints. It is shown that the intermediate thrust arc can be optimal and the exact necessary conditions are derived with the maximum-turn-rates sustained. A variety of the optimal pull-ups are also shown when the initial velocity is varied. Author

**FLYING HANDS OFF TO A HOVER**

J. H. BRAHNEY Aerospace Engineering (ISSN 0736-2536), vol. 6, April 1986, p. 10-15.

Using microprocessors, multifunction CRT displays, and multiplex digital data buses, helicopter electric flight director systems are integrated with digital automatic flight control systems (DAFCS) to enable hands-off flying for IFR certification. Flight management systems (FMS), consolidate information from the communications, navigation, and performance subsystems. The electronic flight instrument system, using the EDZ-705 electronic flight instrument system, displays flight data such as airspeed and altitude on the electronic attitude director indicator (EADI), and data such as heading and bearing on the electronic horizontal situation indicator (EHSI). DAFCS is an integrated autopilot with a full range of horizontal and vertical flight guidance modes, including all radio guidance modes, hover mode, and coupled collective. An ILS approach can be flown, with navigation mode armed to capture the localizer, the ILS mode armed to capture glide slope, and the radio altimeter DH set to IFR minimum altitude. R.R.

**GUIDANCE, NAVIGATION, AND CONTROL FOR 21ST CENTURY AIRCRAFT**

J. H. BRAHNEY Aerospace Engineering (ISSN 0736-2536), vol. 6, April 1986, p. 18-24.

Developments such as optical fault-tolerant buses, full digital fly-by-wire control, and active flutter suppression for military aircraft with stores, will make possible ultra fault-tolerant, reliable, high-integrity flight control systems and avionics architectures for the next generation civil and military aircraft. Multiple-redundant automatic flight control systems (AFCS) will enable maximum airframe and engine element performance by relaxing many traditional stability and control constraints. Local flow or vortex control over all lifting surfaces and parts of the fuselage, and integration of highly interactive subsystems like vectored thrust, will improve cruise performance, short field capability, and maneuverability. Other innovations foreseen include automated situational information management systems, the application of artificial intelligence, and local pressure, vibration, surface conditions, and deflection measurement sensors. **AN APPLICATION OF SELF-TUNING REGULATOR TO GLA SYSTEM OF AN AIRCRAFT**

M. KOBAYAKAWA, K. SAKURA, and H. IMAI (Setsunan University, Japan) Kyoto University, Faculty of Engineering, Memoirs (ISSN 0023-6063), vol. 48, Jan. 1986, p. 60-74. refs

In this paper, a Self-Tuning Regulator (STR), one of the adaptive control strategies, is applied to the gust load alleviation system of a large civil aircraft. Two types of STR are introduced. For algorithm 1, the restriction that the number of the inputs must be equal to that of the outputs is imposed. On the contrary, for algorithm 2, this restriction is released. These two algorithms are applied to alleviate the gust response of aircrafts, firstly a rigid aircraft and secondly a flexible one. In consequence of simulations, it is found that the STR can alleviate the gust response of aircrafts favorably. A STR is more effective to alleviate response to a discrete gust than to a continuous gust. In spite of the inaccurate estimation of system parameters, the STR works well. Generally, the proposed STRs show better performance for a rigid aircraft than for a flexible one. However, even for the latter, by choosing initial values of parameters appropriately, good results can be obtained. Author

**NEW LINEAR TRACKING FILTERS**

D. ANDRISANI, II (Purdue University, West Lafayette, IN) IN: 1985 American Control Conference, 4th, Boston, MA, June 19-21, 1985, Proceedings. Volume 1 . New York, Institute of Electrical and Electronics Engineers, 1985, p. 175-178. refs

A description is provided of linear tracking filters with superior ability to track maneuvering aircraft. The filters model both the vehicle rotation and translation degrees of freedom, and compute both the magnitude and direction of the vehicle acceleration. The estimation of attitude improves the filter's ability to estimate position and velocity, as a result of the correlation between aircraft acceleration and attitude. Some linearizing assumptions are needed on account of the nonlinearity of the relationship between attitude and acceleration. Attention is given to a mathematical model for the pitch rotation degree of freedom, the state equation model for vertical translation and pitch rotation, and the tracker model. G.R.

**ADAPTIVE FLUTTER SUPPRESSION IN THE PRESENCE OF TURBULENCE**

A. CHAKRAVARTY, D. GANGSAAS (Boeing Co., Seattle, WA), and J. B. MOORE (Australian National University, Canberra, Australia) IN: 1985 American Control Conference, 4th, Boston, MA, June 19-21, 1985, Proceedings. Volume 2 . New York, Institute of Electrical and Electronics Engineers, 1985, p. 751-756.

This paper presents an application of adaptive control to flutter suppression for an aircraft flying in turbulence. The adaptive control law is integrated with a nominal constant gain controller and furnishes the equivalent of a 180 deg phase margin at the flutter frequency. The design approach blends the classical, linear quadratic Gaussian and adaptive synthesis techniques, so that each contributes at its point of strength to achieve a robust control law with good performance characteristics. It is shown that the adaptive controller stabilizes the flutter in the face of arbitrary initial parameter estimates, unmodeled stochastic inputs, and significant level of spillover dynamics. Author

**TIME DOMAIN CONTROL DESIGN FOR ROBUST STABILITY OF LINEAR REGULATORS - APPLICATION TO AIRCRAFT CONTROL**

R. K. YEDAVALLI (Stevens Institute of Technology, Hoboken, NJ) IN: 1985 American Control Conference, 4th, Boston, MA, June 19-21, 1985, Proceedings. Volume 2 . New York, Institute of Electrical and Electronics Engineers, 1985, p. 914-919. refs

This paper addresses the aspect of 'Stability Robustness' of linear systems in time domain. Upper bounds on the linear perturbation of an asymptotically stable linear system are obtained to maintain stability, both for 'structured' as well as 'unstructured' perturbations using Liapunov approach. A quantitative measure called 'Stability Robustness Index' is introduced and this measure is used to design 'robust' controllers for Linear Quadratic (LQ) Regulators. The proposed control design algorithm can be used, for given set of perturbations, to select the range of control effort for which the system is stability robust. Conversely it can also be used, for given control effort, to determine the range of the size of allowable perturbations. The algorithm is illustrated with the help of an aircraft control example. The scope of the proposed research and its extension to LQG Regulators, dynamic compensator design and other applications are discussed. Author

### COORDINATED BANK-TO-TURN AUTOPILOT DESIGN

C.-F. LIN (Boeing Co., Seattle, WA) and W. R. YUEH (Northrop Corp., Electronics Div., Hawthorne, CA) IN: 1985 American Control Conference, 4th, Boston, MA, June 19-21, 1985, Proceedings. Volume 2 . New York, Institute of Electrical and Electronics Engineers, 1985, p. 922-926. refs

Bank-to-turn (BTT) missile coordinated autopilot system design principle is presented. The general design concept, design objective and requirement, design approach, and performance analysis are discussed. The closed loop system of the resulting control law is stable for a wide range of flight conditions with little changes in the location of the closed loop eigenvalues. The control loop frequency responses of six flight conditions during the terminal phase are presented to show the robustness of a feedback controller design. Simulations of the time responses of the tracking system are also presented to demonstrate tracking autopilot with good turn coordination. Author

### FLIGHT TEST TRAJECTORY CONTROLLER SYNTHESIS WITH CONSTRAINED EIGENSTRUCTURE ASSIGNMENT

P. K. A. MENON, H. A. SABERI, R. A. WALKER (Integrated Systems, Inc., Palo Alto, CA), and E. L. DUKE (NASA, Flight Research Center, Edwards, CA) IN: 1985 American Control Conference, 4th, Boston, MA, June 19-21, 1985, Proceedings. Volume 3 . New York, Institute of Electrical and Electronics Engineers, 1985, p. 1181-1186. refs

(Contract NAS2-11877)

The design of a maneuver autopilot for flight test trajectory control using constrained eigenvalue/eigenvector assignment is examined. The aircraft considered was a high-performance fighter with a command augmentation system engaged in all three axes. Attention is given to difficulties encountered in the generation of the desired eigenvalues and eigenvectors. It is found that this approach demands several iterations to converge to a satisfactory result, and does not appear to easily yield suitable insight for the output feedback design of high-order multivariable systems which will be used at other operating points. It is concluded that this technique could be made more attractive by generating gradients of the eigensystem between flight conditions, and including this information in the single-point design technique. B.J.

### PILOT INTERFACE WITH FLY-BY-WIRE CONTROL SYSTEMS

W. W. MELVIN (Air Line Pilots Association International, Washington, DC) IN: Aerospace Behavioral Engineering Technology Conference, 4th, Long Beach, CA, October 14-17, 1985, Proceedings . Warrendale, PA, Society of Automotive Engineers, Inc., 1985, p. 153-157. refs

(SAE PAPER 851836)

The problems of pilot interface with automatic fly-by-wire control systems are described. The differences between manual and automatic aircraft control are examined. The incorporation of stability augmentation systems with fly-by-wire automatic systems to enhance the stability of the aircraft is discussed. I.F.

**A86-35457**

### SR-71 DIGITAL AUTOMATIC FLIGHT AND INLET CONTROL SYSTEM

R. P. DEGREY, R. L. NELSON, and J. E. MEYER (Lockheed Corp., Burbank, CA) IN: Aerospace Behavioral Engineering Technology Conference, 4th, Long Beach, CA, October 14-17, 1985, Proceedings . Warrendale, PA, Society of Automotive Engineers, Inc., 1985, p. 399-410.

(SAE PAPER 851977)

This paper presents a description and treats the integration of a new triple channel multi-rate Digital Automatic Flight and Inlet Control System (DAFICS) into the SR-71 aircraft. Predicted airframe longevity to the year 2000 and aging automatic flight control/air inlet control analog systems dictated a modernization program to insure supportability over the life span of the aircraft. Aerodynamic consideration and development rationale is provided. A functional system description identifies the systems being replaced. Simulation, hardware/software development, redundancy management and flight experience is presented. Finally, digital and analog control comparisons are made and improvements discussed. Author

**A86-35563#**

### FRONT SEAT ON THE FUTURE

B. ZIEGLER (Airbus Industrie, Blagnac, France) Aerospace America (ISSN 0740-722X), vol. 24, April 1986, p. 66-68, 70.

Design and performance features of the Airbus 320 cockpit and control systems are outlined. The aircraft, designed to be almost completely computer-controlled with no single-failure flight critical systems, is to always maintain a minimum pitch roll control. The conventional control surfaces will have a mix of electrical and hydraulic actuators, the mechanical systems being largely emergency back-ups. There will be no mechanical linkage between the cockpit and the control mechanisms. The conventional configuration wil provide a neutral static stability which aids the limited back-up control mechanisms. The various techniques being incorporated into the flight control system to enhance instructor-student interactions and permit pilot-first officer interactive control of the aircraft in low-altitude turbulent flight regimes are described. One innovative feature of the automated control system is the provision of a wind shear modes to compensate for pilot errors. M.S.K.

### HIGHER HARMONIC CONTROL - WIND TUNNEL DEMONSTRATION OF FULLY EFFECTIVE VIBRATORY HUB FORCE SUPPRESSION

J. SHAW, N. ALBION, E. J. HANKER, JR., and R. S. TEAL (Boeing Vertol Co., Philadelphia, PA) IN: American Helicopter Society, Annual Forum, 41st, Fort Worth, TX, May 15-17, 1985, Proceedings . Alexandria, VA, American Helicopter Society, 1985, p. 1-15. refs

A dynamically scaled model of the three-bladed CH-47D helicopter rotor has successfully demonstrated closed loop Higher Harmonic Control (HHC) in wind tunnel tests, simultaneously suppressing vertical and in-plane 3/rev hub forces throughout the test envelope. HHC has accomplished this level of suppression by means of a fixed gain feedback control law that is simpler and faster than the adaptive control laws recently employed by others. The controller applied small amounts of oscillatory swashplate motion in order to generate multiharmonic blade pitch variations of up to + or - 3 deg at very high speed. O.C.

**HELICOPTER GUST ALLEVIATION, ATTITUDE STABILIZATION, AND VIBRATION ALLEVIATION USING INDIVIDUAL-BLADE-CONTROL THROUGH A CONVENTIONAL SWASH PLATE**

N. D. HAM (MIT, Cambridge, MA) IN: American Helicopter Society, Annual Forum, 41st, Fort Worth, TX, May 15-17, 1985, Proceedings . Alexandria, VA, American Helicopter Society, 1985, p. 33-45. NASA-sponsored research. refs

The novel active control system presented for helicopter rotor aerodynamic and aeroelastic problems involves the individual control of each blade in the rotating frame over a wide range of frequencies (up to the sixth harmonic of rotor speed). This Individual Blade Control (IBC) system controls blade pitch by means of broadband electrohydraulic actuators attached to the swash plate (in the case of three blades) or individually to each blade, using accelerometer signals to furnish control commands to the actuators. Attention is given to IBC's application to blade lag, flapping, and bending dynamics. It is shown that gust alleviation, attitude stabilization, vibration alleviation, and air/ground resonance suppression, are all achievable with a conventional helicopter swash plate. O.C.

**DIRECTIONAL HANDLING QUALITIES REQUIREMENTS FOR NAP OF THE EARTH (NOE) TASKS**

C. C. BIVENS (NASA, Ames Research Center; U.S. Army, Aeromechanics Laboratory, Moffett Field, CA) IN: American Helicopter Society, Annual Forum, 41st, Fort Worth, TX, May 15-17, 1985, Proceedings . Alexandria, VA, American Helicopter Society, 1985, p. 297-314. refs

A piloted simulator experiment has been conducted to ascertain the directional axis handling requirements of hover and below 40-kt tasks of a scout/attack helicopter, with attention to such light helicopter configurations as those being considered for the 'LHX' program. Two types of yaw stability and control augmentation system were implemented: one consisted of a washed-out yaw rate feedback and shaped control unit, while the other involved a yaw rate command heading-hold system. Experiment results indicate that rotorcraft configurations with high directional gust sensitivity require greater minimum yaw damping to maintain satisfactory handling qualities in nap of the earth flight. Yaw damping and control response are critical handling qualities parameters in air-to-air target acquisition and tracking. O.C.

**ASSESSMENT OF ROTORCRAFT AGILITY AND MANEUVERABILITY WITH A PILOT-IN-THE-LOOP SIMULATION**

L. S. LEVINE, F. W. WARBURTON (United Technologies Corp., Sikorsky Aircraft Div., Stratford, CT), and H. C. CURTISS, JR. (Princeton University, NJ) IN: American Helicopter Society, Annual Forum, 41st, Fort Worth, TX, May 15-17, 1985, Proceedings . Alexandria, VA, American Helicopter Society, 1985, p. 315-325.

Attention is given to an economical, minicomputer-based, six-degree-of-freedom piloted simulation for assessing the effect of rotorcraft design parameters on combat effectiveness. A pilot-directed vehicle is used whose agility and maneuverability characteristics can be varied for different flights against a computer-driven adversary. The effects of roll time constant, sideslip envelope, and auxiliary propulsion system are investigated for two combat scenarios employing forward firing guns; effectiveness is quantified in terms of the probabilities of target kill and of survival over combat time. The results obtained provide insight into the relationship between vehicle handling qualities and weapons pointing tasks during maneuvering flight. O.C.

**A86-35625**

**HELICOPTER HANDLING REQUIREMENTS BASED ON ANALYSIS OF FLIGHT MANEUVERS**

R. K. HEFFLEY and S. M. BOURNE (Manudyne Systems, Inc., Los Altos, CA) IN: American Helicopter Society, Annual Forum, 41st, Fort Worth, TX, May 15-17, 1985, Proceedings . Alexandria, VA, American Helicopter Society, 1985, p. 339-344. refs

An approach is described for the direct examination of helicopter flight maneuvers in order to determine handling qualities requirements. A general procedure is outlined for relating closed-loop discrete maneuver performance features to conventional open-loop vehicle characteristics. Two of the main maneuver features analyzed are the maneuver aggressiveness and maneuver amplitude. Flight data results from a variety of roll-axis maneuvers are presented. It can be seen that maneuver aggressiveness is highest for low-amplitude maneuvers and, because of an apparent upper bound on peak roll rate, lessens for larger-amplitude commands. Author

**A COMPARATIVE STUDY OF AN ARTICULATED INTEGRATED SIDE-ARM CONTROLLER IN A VARIABLE STABILITY HELICOPTER**

J. M. MORGAN (National Aeronautical Establishment, Flight Research Laboratory, Ottawa, Canada) IN: American Helicopter Society, Annual Forum, 41st, Fort Worth, TX, May 15-17, 1985, Proceedings . Alexandria, VA, American Helicopter Society, 1985, p. 359-366. refs

A large amplitude displacement four degrees of freedom manipulator was flown in a piloted experiment as a fully integrated side-arm controller (SAC) in the NAE Airborne Simulator. The experimental tasks were flown by four evaluation pilots using (1) conventional helicopter controls, (2) the SAC configured with a spherical grip and (3) the SAC configured with a conformal vertically oriented grip. Cooper Harper data for a series of tasks at and around the hover suggest that the grip configured controller degrades the vehicle by approximately one half of a Cooper Harper point, but that the spherical interface leads to approximately 1.5 points degradation. The spherical grip was noted as being more prone to cross-coupling than the conformal grip. Author

**LOCALLY OPTIMAL CONTROL IN SYSTEMS WITH DELAY [LOKAL'NO-OPTIMAL'NOE UPRAVLENIE V SISTEMAKH S ZAPAZDYVANIEM]**

G. L. DEGTIAREV and S. A. TERENTEV Aviatsionnaia Tekhnika (ISSN 0579-2975), no. 4, 1985, p. 39-42. In Russian.

The problem of determining control parameters in flight vehicle stabilization systems with delay is analyzed for the case of incomplete measurements of the state. Optimal control is determined as a function of the current and previous measurements of the system state. The problem is reduced to that of solving a closed system of equations for the unknown parameters. V.L.

**PRELIMINARY DESIGN OF LOW AUTHORITY SAS. I**

T. HACKER (Institute of Aviation, Bucharest, Rumania) and B. TEODORESCU (Bucuresti, Institutul Politehnic, Bucharest, Rumania) Revue Roumaine des Sciences Techniques, Serie de Mecanique Appliquee (ISSN 0035-4074), vol. 30, Nov.-Dec. 1985, p. 565-576.

The early stage of preliminary synthesis is viewed from the flight dynamicist's standpoint. Specific eigenvalue requirements concerning damping, frequency, and initial response are directly mapped into control gain space. Time domain criteria are seen to influence selection of the system structure and the gain values. Problems caused by flight control system/airframe interaction are considered. Modal requirements currently assigned to airframe alone are extended to airframe/flight control system dynamics and feedbacks of airframe states are used to cure flight control system-induced instability. Author

**A COMPUTER CONTROLLED AUTOPILOT AND AN ANNUNCIATION SYSTEM FOR LIGHT AIRCRAFT**
S. N. DWIVEDI (North Carolina, University, Charlotte) IN: Computers in engineering 1985; Proceedings of the International Computers in Engineering Conference and Exhibition, Boston, MA, August 4-8, 1985. Volume 3 . New York, American Society of Mechanical Engineers, 1985, p. 111-119. refs

A design is described for an integrated autopilot for a light aircraft, that not only flies the airplane but also monitors its systems. In the event of any malfunction, the onboard computer announces the problem and on command follows the remedial procedure. Features of the system include the use of a synthesized voice to prompt the pilot or announce malfunctions and the use of a microcomputer to monitor the aircraft systems. The system incorporates the best features of several existing autopilots and consists of nine different processors for the following functions: system controller, backup, autopilot, navigation, integrated data control, radio adapter unit, electronic horizontal situation indicator, Votrax speech units, and the hand-held computer. **THE INFLUENCE OF SAMPLING RATE ON THE DYNAMICS AND CONTROL OF AERONAUTICAL SYSTEMS**
J. C. HOWARD and L. D. WEBSTER (NASA, Ames Research Center, Moffett Field, CA) IN: Annual Pittsburgh Conference 16th, University of Pittsburgh, PA, April 25, 26, 1985, Proceedings. Research Triangle Park, NC, Instrument Society of America (Modeling and Simulation. Volume 16, Pt. 5), 1985, p. 1467-1478. refs

It is shown in the design of aeronautical control systems that sampling rate variations give rise to migrations of the discrete eigenvalues for both the plant and the controllers. In general, these migrations tend to degrade simulation fidelity and the overall performance of Ultrareliable Fault Tolerant Control Systems (UFTCS). These systems consist of a redundant asynchronous network of microprocessors which use sensor information to generate the servo commands that drive actuators, thrust linkages, etc. A change in the sampling period of a single microprocessor will, in addition to causing an eigenvalue shift, alter the magnitude of the servo command issued by the controller. The influence of these changes and the effect of initial conditions and skew are considered. Author

**ADAPTIVE CONTROL ROBUSTNESS IN FLEXIBLE AIRCRAFT APPLICATION**
E. N. SANCHEZ (NASA, Langley Research Center, Hampton, VA) American Control Conference, Seattle, WA, June 18-20, 1986, Paper. 4 p. refs

This paper presents the application of a model reference adaptive control (MRAC) algorithm to flexible aircraft flight control. The algorithm is an adaptive version of the Command Generator Tracking (CGT) control technique. This technique forces a dynamic system to follow a reduced-order model, allowing it to cope with the problem of unmodeled dynamics. The studies were made via simulation, using for the plant an aircraft dynamic model similar to the B1 bomber. This model is of a large aircraft with a reasonable amount of structural flexibility. In particular, flight configurations were analyzed where the influence of the flexible modes make it difficult to control the aircraft. The results indicate that the algorithm has good robustness properties vis-a-vis unmodeled dynamics and can force the flexible aircraft to follow rigid body responses. Author

A mechanical system to control the position of a rotating swashplate is developed. This system provides independent lateral cyclic, longitudinal cyclic and collective pitch control of a helicopter rotor attached to the swashplate, without use of a mixer box. The system also provides direct, linear readout of cyclic and collective swashplate positions. A swashplate control system has a first gimbal ring pivotally mounted along a longitudinal axis. A second gimbal ring is pivotally attached to the first gimbal ring along a lateral axis. A longitudinal cyclic actuator pivots the first gimbal ring along the longitudinal axis. A lateral cyclic actuator pivots the second gimbal ring along the lateral axis. The lateral cyclic actuator is mounted on the first gimbal ring. A swashplate is rotatably mounted on the second gimbal ring. Prior swashplate control systems required use of a mixer box to provide true decoupling of lateral and longitudinal cyclic input to the swashplate. Author

**EIGENSTRUCTURE ASSIGNMENT AND ITS APPLICATION IN DESIGN OF FLIGHT CONTROL SYSTEMS**
Z. GENG and D. FU May 1986 15 p refs Transl. by SCITRAN, Santa Barbara, Calif.
(Contract NASW-4004)
(NASA-TM-88411; NAS 1.15:88411) Avail: NTIS HC A02/MF A01 CSCL 01C

The present paper is concerned with an extension of the basic concept and the algorithm of eigenstructure assignment. A general conclusion is drawn regarding the assignment of freedoms in the case of the eigenstructure, taking into account a completely controllable linear time-invariant system. The new algorithms are provided for assigning the eigenstructure with multiple eigenvalues and/or with complex conjugate eigenvalues. The application of the eigenstructure assignment method to the design of a flight control system is illustrated with the aid of a numerical example involving an aircraft flight control system. In this research period a synthesis methodology for multifunctional robust aeroservoelastic systems was developed. The development consisted of the following stages: (1) development of an universal diagram to determine phase and gain margins of a multi-input multi-output (MIMO) system using singular value based stability margin criteria; (2) determination of singular value gradients with respect to design parameters and their application to improve stability margins of multiloop system; and (3) application of constrained optimization techniques to synthesize a low order robust controller for a high order MIMO aeroservoelastic system while satisfying several design constraints on the dynamic loads and responses and stability margins at the plant input and output. Overall research activities are summarized. Author

**LATERAL AND LONGITUDINAL AERODYNAMIC STABILITY AND CONTROL PARAMETERS OF THE BASIC VORTEX FLAP RESEARCH AIRCRAFT AS DETERMINED FROM FLIGHT TEST DATA**

W. T. SUIT and J. G. BATTERSON Apr. 1986 38 p
(NASA-TM-87711; NAS 1.15:87711) Avail: NTIS HC A03/MF A01 CSCL 01C

The aerodynamics of the basic F-106B were determined at selected points in the flight envelope. The test aircraft and flight procedures were presented. Aircraft instrumentation and the data system were discussed. The parameter extraction procedure was presented along with a discussion of the test flight results. The results were used to predict the aircraft motions for maneuvers that were not used to determine the vehicle aerodynamics. The control inputs used to maneuver the aircraft to get data for the determination of the aerodynamic parameters were discussed in the flight test procedures. The results from the current flight tests were compared with the results from wind tunnel test of the basic F-106B. B.G.

**EXPERIMENTAL STUDY OF APEX FENCES FOR LIFT ENHANCEMENT ON A HIGHLY SWEPT DELTA WING CONFIGURATION M.S. Thesis**

M. STUART Dec. 1985 197 p refs
(AD-A163877; AFIT/GAE/AA/85D-14) Avail: NTIS HC A09/MF A01 CSCL 12A

The longitudinal stability characteristics of a 60 deg. delta wing/body model equipped with various types of apex fences were studied experimentally. The experimental effort used force balance instrumentation and oil flow visualization. The locations of the fence-generated vortices and leading-edge vortices associated with highly swept wings were also determined. Five major fence parameters (shape, surface area, cant, length-to-height, movement) were studied and the results are given in a qualitative analysis. Results indicate a favorable application of apex fences for STOL operations. The fences increase lift and positive pitching moment which dictates the use of trailing edge flaps, further increasing the available maximum lift for takeoff and landing. Accompanying this is a large increase in drag at low angles of attack and a marginal increase at moderate to high angles. The relative strength of nose-down pitching moments at high (above 35 deg.) angles of attack produced by apex fences is slight. Apex fences seem to be a technology whose time may have come. Further research of the lateral behavior of a fenced aircraft appears warranted. GRA

**MULTIVARIABLE CONTROL LAW DESIGN FOR ENHANCED AIR COMBAT MANEUVERING. F-15/STOL (SHORT TAKE-OFF AND LANDING) DERIVATIVE FIGHTER M.S. Thesis**

K. A. SHEEHAN Dec. 1985 378 p refs
(AD-A164017; AFIT/GE/EE/85D-38) Avail: NTIS HC A17/MF A01 CSCL 01B

Proportional plus integral controllers are designed for the longitudinal mode using a multivariable control law theory developed by Professor Brian Porter of the University of Salford, England. Control laws are formulated by use of a computer-aided multivariable design program entitled MULTI. In addition MULTI performs a digital closed-loop simulation for controller performance analysis. The aircraft model is developed from linearized data. Decoupling of the longitudinal output variables is achieved and demonstrated by four maneuvers (pitch-pointing, vertical translation, direct climb, and constant g pull-up). Plant parameter variation effects are also examined. Destabilizing effects to include actuator and sensor dynamics computational time delay random Gaussian sensor noise and simulation nonlinearities are included. Results show stable responses for all simulations. Except for the most demanding simulations (all destabilizing effects considered), controller responses are smooth and well behaved. Recommendations include proposed future work in thrust vector modeling and suggested improvements to the computer-aided design program, MULTI. GRA

**LQG/LTR DESIGN OF A ROBUST FLIGHT CONTROLLER FOR THE STOL F-15 M.S. Thesis**

G. L. GROSS Dec. 1985 182 p refs
(AD-A164111; AFIT/GAE/ENG/85D-1) Avail: NTIS HC A09/MF A01 CSCL 17G

A robust controller for the approach and landing phase of the Short Take-off and Landing (STOL) F-15 is developed via LQG/LTR (Linear System model, Quadratic cost, Gaussian models of uncertainty, used for controller synthesis, with Loop Transmission Recovery techniques of tuning the filter in the loop for control robustness enhancement) methods. Reduced-order full-state feedback controllers are synthesized using CGT/PT (Command Generator Tracking feedforward compensator to incorporate handling qualities, with Proportional plus Integral feedback) synthesis, specifically using implicit model following to provide good robustness characteristics in the full-state feedback case. The robustness is fully assessed using realistic simulations of the real-world system with meaningful deviations from design conditions. Once a Kalman filter is embedded into the loop to estimate states rather than assuming artificial access to all states, LTR methodology is used to preserve as much robustness as possible. A full assessment of performance and robustness of these final implementable designs is provided. GRA

**ROLE OF OPTIMIZATION METHODS IN IMPROVEMENT OF FLIGHT CONTROL FOR AIRPLANES Abstract Only**
G. M. KASHIN *In its* USSR Report: Engineering and Equipment (JPRS-UEQ-86-002) p 10 7 Feb. 1986 Transl. into ENGLISH from Standarty i Kachestvo (Moscow, USSR), no. 12, Dec. 1984 p 15-18
Avail: NTIS HC A06/MF A01

While conventional computer aided automatic flight control alone improves the static and dynamic characteristics of aircraft, active automatic control can further improve the flight mechanics by means of reduction of takeoff mass. Such a control system is capable of performing other additional functions as well, namely relaxing the constraints on natural static stability, reducing the loads involved in maneuvers, increasing the stability margin under flutter, damping elastic vibrations in a turbulent atmosphere, direct control of lift and lateral forces, improving the flight aerodynamics, prevention of dives and spins, and improving passenger comfort. The stability margin is reduced by increasing the stability level. The design of such a system is based on analysis of surges and vibrations, requires inclusion of corrective filters, and calls for optimization of the control algorithm for the special application. One approach proposed is the approach taken for optimizing the parameters of standardization objects. Author

**ENGINEERING FLIGHT SIMULATION - A REVOLUTION OF CHANGE**
T. L. FRASER and C. E. PHILLIPS (Boeing Computer Services Flight Systems Laboratory, Seattle, WA) IN: Flight simulation/simulators; Proceedings of the Aerospace Technology Conference and Exposition, Long Beach, CA, October 14-17, 1985 . Warrendale, PA, Society of Automotive Engineers, Inc., 1985, p. 11-17.
(SAE PAPER 851901)

Issues which require consideration when developing an engineering simulation facility are presented, with emphasis placed on the incorporation of a dynamic computing technology into short and long-term planning. The effects of the operation environment, simulation growth, and simulation payoff are discussed in relation to external influences of computer architecture, re-education of the programmer, and simulation user help. It is concluded that new simulation technology may include the application of a modular computing architecture in the form of multi-processors and engineering workstations, as well as extensive input/output and file networking systems. Moreover, it would include the selection and education of new programming languages and the development of adequate help systems. K.K.

**A86-36944**
**CAPABILITIES OF AIRBORNE AND GROUND BASED FLIGHT SIMULATION**
S. R. MARKMAN (USAF, Flight Dynamics Laboratory, Wright-Patterson AFB, OH) IN: Flight simulation/simulators; Proceedings of the Aerospace Technology Conference and Exposition, Long Beach, CA, October 14-17, 1985 . Warrendale, PA, Society of Automotive Engineers, Inc., 1985, p. 35-42.
(SAE PAPER 851944)

Major capabilities and limitations of ground based and in-flight simulation are discussed, and the unique role of in-flight simulation for test pilot training is demonstrated. Inherent advantages of ground-based simulation include unlimited flexibility, easy design modification, the absence of flight safety issues and the early evaluation of new systems and aerodynamic effects. However, motion and visual cues are insufficiently simulated but they are readily available in in-flight simulation, together with greater control precision. Disadvantages associated with this mechanism include a lack of control power, less flexibility in reconfiguring cock-pit equipment, and a psychological barrier connected to safety-pilot presence. It is concluded that the use of both types of simulators in a combined flight simulation program is justified and desirable. K.K.

**THE DEVELOPMENT AND CALIBRATION OF AN ACOUSTIC WALL TRANSONIC TEST SECTION**

R. L. BENGELINK, R. P. DOERZBACHER, and A. J. KRYNYTZKY (Boeing Commercial Airplane Co., Seattle, WA) AIAA, Aerodynamic Testing Conference, 14th, West Palm Beach, FL, Mar. 5-7, 1986. 10 p. refs
(AIAA PAPER 86-0759)

The Boeing transonic wind tunnel has been equipped with an optional test section to allow near-field acoustic measurements for many types of models, including propfan-type propulsion simulators. Acoustic requirements led to a design using unventilated walls made of small cell, acoustic foam 12-in thick covered with a thin 50 percent porosity, perforated plate. In order to ensure maximum effectiveness of the sound material forward of the model noise-generating parts, a circumferential slot to reduce wall boundary layer momentum thickness is included in the configuration. Much of the test section development was accomplished using the 1/20-scale pilot transonic wind tunnel. Operational limits due to model blockage, wall divergence sensitivity, wall loads, and wall boundary layer slot performance were evaluated in the pilot facility. Also included in the development was a computational fluid dynamics Euler code analysis of a model with actuator disc for evaluation of wall interference due to propfan thrust. The code also addressed flow qualities around a propfan with wall boundary layer bleed. Author

Requirements for new technologies in the area of civil aircraft design are mainly related to the high cost involved in the purchase of modern, fuel saving aircraft. A second important factor is the long term rise in the price of fuel. The demonstration of the benefits of new technologies, as far as these are related to aerodynamics, will,for the foreseeable future, still be based on wind tunnel measurements. Theoretical computation methods are very successfully used in design work, wing optimization, and an estimation of the Reynolds number effect. However, wind tunnel tests are still needed to verify the feasibility of the considered concepts. Along with other costs, the cost for the wind tunnel tests needed for the development of an aircraft is steadily increasing. The present investigation is concerned with the effect of numerical aerodynamics and civil aircraft technology on the development of wind tunnels. Attention is given to the requirements for the wind tunnel, investigative methods, measurement technology, models, and the relation between wind tunnel experiments and theoretical methods. F.M.R.

**MATERIALS FOR EMERGENCY REPAIR OF RUNWAYS Final Report, 1 Apr. 1984 - 14 Feb. 1985**

S. POPOVICS 20 Mar. 1985 236 p refs
(Contract AF-AFOSR-0245-83)
(AD-A164225; REPT-001120-1; AFOSR-85-1229TR) Avail: NTIS HC A11/MF A01 CSCL 11B

The primary objective of this project was to identify or develop an inorganic cementing material that is suitable for emergency repair of damaged airport runways under war conditions. In the first half of the work several commercially available rapid hardening cements were screen-tested as presented in an earlier progress report. It was established on this basis that the SET-45 formulas and their modifications appeared to be the most promising for achieving the given objectives of this project. These objectives were: at least 2000 psi compressive strength at the age of 1 hour; adequately long setting time; good bond to old concrete; and minimum shrinkage under every weather condition. Since then both mechanical (compressive and flexural strengths, bond, shrinkage, etc.) and physicochemical tests (X-ray diffraction, scanning electron microscopy, infrared spectroscopy, etc.) were performed with these materials to see the technically important properties of these cements under various curing conditions and learn about the basic nature of these materials. **CAN WE DEVELOP THE 1.5 MILLION POUND AEROSPACE PLANE?**
D. J. HOLT Aerospace Engineering (ISSN 0736-2536), vol. 6, April 1986, p. 26-30.

A technology readiness and economic feasibility evaluation is made of hypersonic, 'transatmospheric' aerospace vehicles; attention is given to the prospects for propulsion systems capable of attaining the Mach 25 escape velocity needed to reach low earth orbits and duplicating many of the functions currently undertaken by the Space Shuttle. Either two integrated propulsion systems or two 'staged' vehicles may be employed to yield the requisite operational capabilities. The claims of competing airbreathing and nonairbreathing (rocket) propulsion systems are evaluated. O.C.

(SAWE PAPER 1674)

Future manned, reusable earth-to-orbit vehicles may be required to reach orbit within hours or even minutes of a mission decision. A study has been conducted to consider vehicles with such a capability. In the initial phase of the study, 11 vehicles were sized for deployment of 5000 lbs to a polar orbit. From this matrix, two of the most promising concepts were resized for a modified mission and payload. A key feature of the study was the use of consistent mass estimating techniques for a broad range of concepts, allowing direct comparisons of sizes and weights. Author

**PASSIVE EDDY-CURRENT DAMPING AS A MEANS OF VIBRATION CONTROL IN CRYOGENIC TURBOMACHINERY**
R. E. CUNNINGHAM Feb. 1986 14 p refs
(NASA-TP-2562; E-2762; NAS 1.60:2562) Avail: NTIS HC A02/MF A01 CSCL 13I

Lateral shaft vibrations produced by a rotating unbalance weight were damped by means of eddy currents generated in copper conductors that were precessing cyclicly in the gap formed by the pole faces of C-shaped, permanent magnets. The damper assembly, which was located at the lower bearing support of a vertically oriented rotor was completely immersed in liquid nitrogen during the test run. The test rotor was operated over a speed range from 800 to 10,000 rpm. Three magnet/conductor designs were evaluated. Experimental damping coefficients varied from 180 to 530 N sec/m. Reasonable agreement was noted for theoretical values of damping for these same assemblies. Values of damping coefficients varied from 150 to 780 N sec/m. The results demonstrate that passive eddy-current damping is a viable candidate for vibration control in cryogenic turbomachinery. Author

**COMPARISON OF AL ALLOYS AND CARBON FIBER COMPOSITE MATERIALS IN AIRCRAFT CONSTRUCTION [VERGLEICH VON AL-LEGIERUNGEN UND CFK-WERKSTOFFEN IM FLUGZEUGBAU]**
F. J. ARENDTS (Stuttgart, Universitaet, West Germany) DGLR, Jahrestagung, Bonn, West Germany, Sept. 30-Oct. 2, 1985. 43 p. In German. refs
(DGLR PAPER 85-136)

A comparison is made between Al alloys and carbon fiber composite (CFC) materials in static loading, emphasizing the adaptability of the results to a variety of situations. Results are presented for tension, pressure, Euler bending, buckling, shear, and torsion. The notch impact strength of CFC is taken into consideration. The fatigue behavior of both materials is compared. The damage in metal sheets under tension is compared with a crack in aluminum-lithium and a pressure-loaded laminate is compared with delamination in CFC. Results of an extended study on weight-optimal materials for a spherical pressure cup in a commercial aircraft are presented. The inherent tendency of orthotropic materials to form elastomechanical couplings vic the elasticity law is discussed. C.D.

**ARALL (ARAMID REINFORCED ALUMINIUM LAMINATES), - A HYBRID COMPOSITE WITH A GREAT RESISTANCE AGAINST FATIGUE CRACK PROPAGATION**
R. MARISSEN (DFVLR, Institut fuer Werkstoff-Forschung, Cologne, West Germany) DGLR, Jahrestagung, Bonn, West Germany, Sept. 30-Oct. 2, 1985. 28 p. DFG-supported research. refs
(DGLR PAPER 85-137)

Modern aircraft structures are subjected to high-level fatigue stresses, and suitable structural materials with a high resistance to such stresses are needed. The present paper is concerned with such a material, taking into account the hybrid composite Arall (Aramid Reinforced Aluminum Laminates). Advantages of Arall are related to extremely low crack growth rates, even at high stress levels, and a large critical crack length. The material consists of thin aluminum alloy sheets (0.3 to 0.5 mm) and layers in which Aramid fibers are incorporated in a structural adhesive. Attention is given to a description of Arall, the statical properties of Arall, the technological properties of Arall, its potential applications, and the observed fatigue mechanisms. G.R.

**STRAINING FOR WEIGHT SAVINGS IN ADVANCED COMPOSITES**

L. J. LINNER (Lockheed-California Co., Burbank, CA) Society of Allied Weight Engineers, Annual Conference, 44th, Arlington, TX, May 20-22, 1985. 70 p. refs

(SAWE PAPER 1685)

The use of advanced composites in aircraft structures is discussed with emphasis on the possibility of increasing the potential levels of strain allowables for the composites. In particular, attention is given to the principal design criteria, test results for new toughened resin systems, an analysis of the primary failure modes, and estimation of weight savings resulting from the use of advanced composites. The study provides a realistic approach to the use of advanced composites in structural design by taking advantage of the high strain allowables while addressing nonoptimum constraints. V.L.

**EFFECT OF FIBER AND MATRIX MAXIMUM STRAIN ON THE ENERGY ABSORPTION OF COMPOSITE MATERIALS**

G. L. FARLEY (NASA, Langley Research Center; U.S. Army, Structures Laboratory, Hampton, VA) IN: American Helicopter Society, Annual Forum, 41st, Fort Worth, TX, May 15-17, 1985, Proceedings . Alexandria, VA, American Helicopter Society, 1985, p. 583-588. refs

Static crushing tests were conducted on graphite composite tubes to examine the influence of fiber and matrix maximum strain at failure on the energy absorption capability of graphite reinforced composite material. Fiber and matrix maximum strain at failure were determined to significantly effect energy absorption. The higher strain at failure composite material system, AS-4/5245, exhibited superior energy absorption capability compared to AS-4/934, T300/5245 or T300/934 composite material. Results of this investigation suggest that to achieve maximum energy absorption from a composite material a matrix material that has a higher strain at failure than the fiber reinforcement should be used. **PROCESS DEVELOPMENT AND TEST EVALUATION OF CAST, HIP AND HEAT TREATED TITANIUM UH-60A M.R. DAMPER BRACKET**

J. KOPCHIK, M. M. SCHWARTZ, and S. SILVERSTEIN (United Technologies Corp., Sikorsky Aircraft Div., Stratford, CT) IN: American Helicopter Society, Annual Forum, 41st, Fort Worth, TX, May 15-17, 1985, Proceedings . Alexandria, VA, American Helicopter Society, 1985, p. 589-593. Army-supported research.

Sikorsky Aircraft recently completed this U.S. Army funded program which produced and qualified a cast titanium Main Rotor Damper Bracket for the UH-60A helicopter to replace the existing forged and machined titanium bracket at a lower cost. The Ti-6Al-4V investment casting was HIP, heat treated, machined and full scale fatigue tested as a part of the acceptance of the material properties and processing techniques needed for production implementation. A series of tensile and fatigue tests also were performed (as well as non-destructive, dimensional, and chemical evaluation of the cast parts). The material for these small scale and the full scale tests came from the successful preproduction of forty-four (44) full scale damper bracket investment castings. Author

**STRUCTURAL MATERIALS IN AERONAUTICS - PROSPECTS AND PERSPECTIVES**

G. G. POPE (Royal Aircraft Establishment, Farnborough, England) Aerospace (UK) (ISSN 0305-0831), vol. 13, April 1986, p. 16-22.

The factors influencing choices of materials for aircraft components are reviewed, along with recent advances in available materials and their applications. The primary concern is weight minimization, followed by maximized strength and stiffness, acceptable life cycle costs and fatigue resistance. The operational environment is of concern, especially near oceans due to corrosion for metals (which can be coated) and weakening of composites (due to water absorption). New aircraft propulsion system designs continually require higher operating temperatures with the concomitant desire for long-life materials. The features, performance and present and projected applications of various composites, Ti alloys, steels and Al alloys, particularly for military purposes, are examined. M.S.K.

**A86-36750**

**WHAT IS THE CHOICE FOR PRIMARY AIRCRAFT STRUCTURES - COMPOSITE OR ALUMINUM MATERIALS? [QUE FAUT-IL CHOISIR POUR LES OEUVRES VIVES - LES MATERIAUX COMPOSITES OU L'ALUMINIUM?]**

B. LIARD (Brochier, S.A., Nevilly-sur-Seine, France) Materiaux et Techniques (ISSN 0032-6895), vol. 74, Jan.-Feb. 1986, p. 37-39. In French.

Aluminum alloys have been the material of choice for aircraft structures for decades due to their light weight, strength and fatigue resistance. Composite materials, at first comprising glass fiber-reinforced polymers, have been used for radomes and secondary structures. The high strength, low weight and fatigue resistance of carbon fiber reinforced plastics (CFRP) have led to their consideration as replacements for aluminum. CFRP materials are at least as fatigue resistant and as stiff as steel and offer significant overall gains in weight reduction if used as aircraft primary structures relative to the same structures made from aluminum. CFRP helicopter blades have already lasted up to four times as long as metal blades, but must be proven to structually resist the separation, shocks and shear forces experienced by metallic aircraft components before being employed in wings and fuselages. The new PEEK-based CRFPs have satisfactory shock resistance, although no field-ready techniques have yet been developed for repairs. The large potential market for CFRPs of sufficient material properties is delineated, along with the properties of the competing Al-Li alloys for the next generations of aircraft. M.S.K.

**A TRANSPORT MODEL FOR FLAMMABILITY OF PREMIXED GASES**

A. J. SABER (Concordia University, Montreal, Canada) IN: Computers in engineering 1985; Proceedings of the International Computers in Engineering Conference and Exhibition, Boston, MA, August 4-8, 1985. Volume 3 . New York, American Society of Mechanical Engineers, 1985, p. 177-181. refs

(Contract NSERC-A-4209)

Criteria for the prediction of flammability limits of premixed gases are presented. The model used incorporates gas phase diffusion in the case of a relatively low pressure, stationary, one-dimensional flow. No additional physio-chemical properties are assumed. Applications include the selection of minimum air/fuel ratios for synthetic aircraft fuels. The model can be extended by relaxing the assumptions and the approach leads directly to numerical solution. Author

### DROP TESTING AND ANALYSIS OF SIX-FOOT DIAMETER GRAPHITE-EPOXY FRAMES

R. L. BOITNOTT (NASA, Langley Research Center; U.S. Army, Aerostructures Directorate, Hampton, VA) and H. D. CARDEN (NASA, Langley Research Center, Hampton, VA) AHS, National Specialist's Meeting on Crashworthy Design of Rotorcraft, Atlanta, GA, Apr. 7-9, 1986, Paper. 10 p. refs

Graphite-epoxy frames were drop tested onto a concrete floor to simulate crash loadings. The frames have Z-shaped cross-sections typical of designs often proposed for fuselage structure of advanced composite transports. The 6-foot diameter of the frames was chosen to reduce specimen fabrication costs and to facilitate testing. Response of the frames from accelerometer, strain gage, and photographic measurements are presented which characterize the behavior under 25-30 fps vertical impact velocity onto concrete. Failure of the graphite-epoxy frames involved a complete separation through the cross section near the impact point. All damage to the composite frame was confined to an area close to the impact point. Failure of aluminum frames tested for comparison were different from the composite specimens. The aluminum frames yielded (plastic hinges formed) at several locations around the lower portion of the frame without failing completely across the section. Author

### NA2SO4 INDUCED CORROSION OF NICKEL AT HIGH TEMPERATURE

A. K. MISRA (NASA, Lewis Research Center, Cleveland, OH) ASM, International Conference on Surface Modifications and Coatings, Toronto, Canada, Oct. 14-16, 1985, Paper. 18 p. refs

Sodium sulfate-induced corrosion of nickel was studied at 900 C as a function of oxygen partial pressure. For high O2 partial pressures, accelerated corrosion during the first few minutes occurred by rapid penetration of the melt along the metal grain boundaries. A mechanism is proposed to explain this phenomenon. Repetitive scale metal detachment was observed for corrosion in lower O2 partial pressures and during the later period of corrosion in higher O2 partial pressures. The effect of preoxidation on the hot corrosion has also been studied. An induction period is observed before the onset of rapid corrosion for the preoxidized samples; the onset of rapid corrosion is associated with sudden cracking of the scale. The length of the induction period for the preoxidized samples is a function of the length of preoxidation, and appears to be related to the structure of the oxide scale after the preoxidation treatment. Author

### COMPRESSIVE STRENGTH OF IMPACT DAMAGED GRAPHITE EPOXY LAMINATES

R. JONES and A. A. BAKER (Ministry of Defence, Aeronautical Research Laboratories, Melbourne, Australia) IN: Composite structures 3; Proceedings of the Third International Conference, Paisley, Scotland, September 9-11, 1985 . London, Elsevier Applied Science Publishers, 1985, p. 402-414. refs

A major long-term objective in the evolution of advanced fiber composites as aircraft structural materials must be the establishment of a damage tolerance methodology. The availability of this methodology would greatly aid the design of safe, efficient composite structures as well as their management in service. There are, however, many difficulties in meeting this objective, including the multiplicity of failure modes in the composites, the numerous types of potentially significant defects which may arise during manufacture or in service, and sensitivity to moisture and temperature. Author

**A86-37134**

### METHOD TO DETERMINE THE COMPLETE THREE-DIMENSIONAL ELASTIC COMPLIANCE MATRIX OF COMPOSITE MATERIALS

A. RUEBBEN and G. SCHARR (Aachen, Rheinisch-Westfaelische Technische Hochschule, West Germany) IN: Composite structures 3; Proceedings of the Third International Conference, Paisley, Scotland, September 9-11, 1985 . London, Elsevier Applied Science Publishers, 1985, p. 760-773. refs

The use of composite materials has rapidly progressed in the past years. Especially in aircraft and aerospace structures, the percentage of components made from composite materials constantly increases, yet the knowledge of many fundamental material properties is still insufficient. The correct calculation of the stress-strain behavior of space structures requires the exact determination of the complete compliance matrix, i.e. of the three-dimensional coefficients of elasticity. The present paper describes an extended testing and computing method to determine all three-dimensional elastic coefficients of composite materials dependent on temperature. The experiments are isothermal, static, short-term tensile tests and short-term torsion tests with low loading to secure elastic behavior. The torsion testing machine was developed according to Krabbe (1960) and Neuhaus (1981). The applied computing method derives from studies by Hoerig (1957). Author

### ADVANCED COMPOSITES - THE STRUCTURAL REVOLUTION

R. C. FORNEY (Du Pont de Nemours and Co., Wilmington, DE) Journal of Metals (ISSN 0148-6608), vol. 38, March 1986, p. 18-20.

An evaluation is made of the development status and development prospects of advanced composites, with attention to projected gains obtained by means of them in design practices, manufacturing methods, energy conservation, and product utility and diversity. Major performance improvements attributable to advanced composites are noted in the aerospace industry, where they have made possible such innovative aircraft configurations as the X-29 forward-swept wing aircraft, and in the automotive industry, where significant parts count reductions are expected from composites-based construction methods. Composites are also noted to lend themselves to automated production methods. Attention is given to the long term socioeconomic consequences of composite materials' increasing use. O.C.

**A86-37137**

### ARAMID FIBER COMPOSITES FOR GENERAL ENGINEERING

D. TANNER, A. K. DHINGRA, and J. J. PIGLIACAMPI (Du Pont de Nemours and Co., Textile Fibers Dept., Wilmington, DE) Journal of Metals (ISSN 0148-6608), vol. 38, March 1986, p. 21-25. refs

The para-aramid known commercially as poly p-phenyleneterephthalamide (PPD-T) consists of liquid crystalline domains oriented in the direction of applied shear during fiber extrusion operations. This high degree of orientation accounts for PPD-T's exceptional fiber strength and stiffness. It is projected that aircraft applications of PPD-T will emphasize damage tolerance and crashworthiness for primary structures. Attention is given to ongoing development efforts to improve matrix interface bonding in composites, including those with novel thermoplastic resin matrices, as well as antiballistic armor, asbestos-replacing composites, and rubber-matrix composites. O.C.

### EVALUATION OF CAPILLARY REINFORCED COMPOSITES Contractor Report, Sep. 1984 - Sep. 1985

J. E. CAHILL, J. F. HALASE, W. K. SOUTH, and L. J. STOFFER Sep. 1985 141 p Original contains color illustrations
(Contract NAS3-24386)
(NASA-CR-175061; NAS 1.26:175061) Avail: NTIS HC A07/MF A01 CSCL 11D

Anti-icing of the inlet of jet engines is generally performed with high pressure heated air that is directed forward from the

compressor through a series of pipes to various manifolds located near the structures to be anti-iced. From these manifolds, the air is directed to all flowpath surfaces that may be susceptible to ice formation. There the anti-icing function may be performed by either heat conduction or film heating. Unfortunately, the prospect of utilizing lighweight, high strength composites for inlet structures of jet engines has been frustrated by the low transverse thermal conductivity of such materials. It was the objective of this program to develop an advanced materials and design concept for anti-icing composite structures. The concept that was evaluated used capillary glass tubes embedded on the surface of a composite structure with heated air ducted through the tubes. An analytical computer program was developed to predict the anti-icing performance of such tubes and a test program was conducted to demonstrate actual performance of this system. Test data and analytical code results were in excellent agreement. Both indicate feasibility of using capillary tubes for surface heating as a means for composite engine structures to combat ice accumulation.

**ALTITUDE IGNITION/LEAN DECEL STUDY Final Report, Aug. 1983 - Jan. 1985**
D. ANDREADIS Nov. 1985 88 p
(Contract F33615-83-C-2329)
(AD-A163052; P/W/GPD-FR-18710; AFWAL-TR-85-2054) Avail: NTIS HC A05/MF A01 CSCL 21B

Analytical tasks consisting of new or improved models for predicting altitude ignition and lean deceleration blowout are developed. The approach taken was to describe the ignition and flame stabilization limits in terms of characteristic time models. Characterisitic times associated with chemical kinetics, fuel evaporation and hot flow residence are quantified for ignition and lean deceleration blowout limits. These expressions were interrelated according to the criteria for successful ignition and flame stabilization. Statistical analysis was used to compare the various expressions and select the appropriate terms that formulate models which best fit the data for altitude ignition and lean deceleration blowout. The models linearly correlate variations in combustor pressure, inlet temperature, fuel-air ratio, fuel temperature, air velocity, pressure drop, combustor front end geometry and injector size using existing data from USAF, Navy, NASA and P&W sponsored programs on operability performance of military and commercial gas turbine combustors. These models have been based entirely on full scale engine test. GRA

The main achievements of a 36-month research program are presented. The main objective was to gain more insight into the problem of crack growth under thermal mechanical fatigue (TMF) conditions. This program was conducted at M.I.T. for the period of September 1982 to September 1985. The program was arranged into five technical tasks. Under Task I, the literature of TMF data was reviewed. The goal was to identify the crack propagation conditions in aircraft engines (hot section) and to assess the validity of conventional fracture mechanics parameters to address TMF crack growth. The second task defined the test facilities, test specimen and the testing conditions needed to establish the effectiveness of data correlation parameters identified in Task I. Three materials (Inconel X-750, Hastelloy-X, and B-1900) were chosen for the program. Task II was accomplished in collaboration with Pratt & Whitney Aircraft engineers. Under Task III, a computerized testing system to measure the TMF behavior (LCF and CG behaviors) of various alloys systems was built. The software used to run isothermal and TMF tests was also developed. Built around a conventional servohydraulic machine, the system is capable of push-pull tests under stress or strain and temperature controlled conditions in the temperature range of 25C to 1050C. A crack propagation test program was defined and conducted under Task IV. The test variables included strain range, strain rate (frequency) and temperature. Task V correlated and generalized the Task IV data for isothermal and variable temperature conditions so that several crack propagation parameters could be compared and evaluated. The structural damage (mode of cracking and dislocation substructure) under TMF cycling was identified and contrasted with the isothermal damage to achieve a sound fundamental mechanistic understanding of TMF. **CONSTANT-LOAD-AMPLITUDE FATIGUE CRACK GROWTH TESTING OF CAST ALUMINUM ALLOYS A201-T7 AND A357-T6 Final Report, Mar. 1983 - Apr. 1984**
J. D. TIRPAK Nov. 1985 60 p refs
(AD-A163494; AFWAL-TR-85-4096) Avail: NTIS HC A04/MF A01 CSCL 11F

This report is a repository of constant-load-amplitude fatigue crack growth rate data for cast aluminum alloys A201-T7 and A357-T6. Conditions were R=0.1, room temperature, lab air, and growth rates were above .0000001 m/cycle. The data herein was published for use by the aerospace community. From this data, it appears as if cast aluminum alloys possess some variability with respect to fatigue crack growth rate. For the most part though, the data is to serve as a nucleus for evaluating fatigue and fracture data for aluminum casting alloys, and generating impetus for further evaluation of these alloys with respect to fracture. **ASPECTS OF SMALL CRACK GROWTH**
M. N. JAMES and J. F. KNOTT *In* AGARD Damage Tolerance Concepts for Critical Engine Components 16 p Oct. 1985 refs
Avail: NTIS HC A13/MF A01

The nature of small defects which occur in engineering components and structures, and their subsequent growth to a size detectable by nondestructive inspection techniques are discussed. Consideration is given to fundamental aspects such as the modifying influence of residual stresses and crack closure on the growth of small cracks. Possible differences between laboratory test data and in-service crack growth are highlighted. Practical aspects are illustrated with specific reference to the example of the safety-critical high pressure turbine disc of an aeroengine.

Over the past decade and a half progress in nondestructive evaluation (NDE) methods which yield quantitative flaw information has been considerable and has sparked a revolution in the way industry and government view the capabilities and benefits of quality assurance or component integrity. Almost no NDE technique, new or established, is selected for research and development without examining its potential for providing accurate, quantitative defect information. Concurrent with this trend has been the increasing use of fracture mechanics in the design and life management of aircraft systems, placing in turn stringent requirements on quantitative nondestructive evaluation (QNDE). Nowhere are these demands heavier than in the case of advanced aircraft engine alloys where critical flaw sizes are measured in hundredths of an inch. Research in NDE, therefore, has concentrated on improving defect sensitivity and reliability and providing the quantitative information essential to the new system maintenance philosphies, such as Retirement-for-Cause. In addition to the well known quantitative capabilities of standard techniques like radiography, dye penetrant, and in some cases, eddy current, developments in quantitative ultrasonics, eddy current, thermal wave techniques and exploitation of new medicial X-ray imaging methods offer alternatives with enhanced capabilities and possibly reduced cost. The state of the art in QNDE is discussed, as well as advanced methods currently in development. Author

**EMISSION FTIR ANALYSES OF THIN MICROSCOPIC PATCHES OF JET FUEL RESIDUES DEPOSITED ON HEATED METAL SURFACES Final Report**
J. L. LAUER and P. VOGEL 30 May 1986 95 p refs
(Contract NAG3-205)
(NASA-CR-176786; NAS 1.26:176786) Avail: NTIS HC A05/MF A01 CSCL 21D

The relationship of fuel stability to fuel composition and the development of mechanisms for deposit formation were investigated. Fuel deposits reduce heat transfer efficiency and increase resistance to fuel flow and are highly detrimental to aircraft performance. Infrared emission Fourier transform spectroscopy was chosen as the primary method of analysis because it was sensitive enough to be used in-situ on tiny patches of monolayers or of only a few molecular layers of deposits which generally proved completely insoluble in any nondestructive solvents. Deposits of four base fuels were compared; dodecane, a dodecane/tetralin blend, commercial Jet A fuel, and a broadened-properties jet fuel particularly rich in polynuclear aromatics. Every fuel in turn was provided with and without small additions of such additives as thiophene, furan, pyrrole, and copper and iron naphthenates. B.G.

**SHARP (STATIONARY HIGH ALTITUDE RELAY PLATFORMS) TELECOMMUNICATIONS MISSIONS AND SYSTEMS**
G. W. JULL, A. LILLEMARK, and R. M. TURNER (Canadian Department of Communications, Communications Research Centre, Ottawa, Canada) IN: GLOBECOM '85 - Global Telecommunications Conference, New Orleans, LA, December 2-5, 1985, Conference Record. Volume 2 . New York, Institute of Electrical and Electronics Engineers, Inc., 1985, p. 955-959. refs

The SHARP (Stationary High Altitude Relay Platform) system concept envisages use of microwave-powered airplanes, circling at an altitude of 21 km, as platforms to distribute telecommunications services within regions of up to about 600 km diameter. Various configurations of airplanes and power transmission systems have been examined. Studies have shown that SHARP would have the technical capability to distribute UHF mobile radio and radio telephone services along with SHF direct broadcast TV channels to rural regions. Unique features of SHARP were found to include capabilities to provide reliable radio telephone service to low power user sets and to permit frequency reuse to meet expanding traffic capacity requirements. **SHARP (STATIONARY HIGH ALTITUDE RELAY PLATFORM) - RECTENNA AND LOW ALTITUDE TESTS**
J. J. SCHLESAK, A. ALDEN, and T. OHNO (Canadian Department of Communications, Communications Research Centre, Ottawa, Canada) IN: GLOBECOM '85 - Global Telecommunications Conference, New Orleans, LA, December 2-5, 1985, Conference Record. Volume 2 . New York, Institute of Electrical and Electronics Engineers, Inc., 1985, p. 960-964. refs

This paper describes a planned low-altitude microwave-powered flight test to demonstrate several key features of the SHARP (Stationary High Altitude Relay Platform) concept. A small-scale airplane will be flown at an altitude of about 50 m, powered by microwave energy transmitted from the ground. RF power at a frequency of 2.45 GHz will be converted to dc by an array of rectennas mounted on the lower surfaces of the airplane's wings. A novel dual-polarized rectenna system has been developed for powering the scaled model. The RF to dc power conversion efficiency of this rectenna is about 60 percent. Author

**INTERNATIONAL SYMPOSIUM ON LASER ANEMOMETRY, 2ND, MIAMI BEACH, FL, NOVEMBER 17-22, 1985, PROCEEDINGS**
A. DYBBS, ED. (Case Western Reserve University, Cleveland, OH) and P. A. PFUND, ED. (Babcock and Wilcox Co., New York) Symposium sponsored by ASME. New York, American Society of Mechanical Engineers (Fluids Engineering Symposia Series. Volume FED-33), 1985, 311 p. For individual items see A86-34408 to A86-34441.

Recent developments in laser anemometry are discussed under the following headings: industrially relevant flows, optical techniques and new instrumentation, turbulent flows and boundary layers, signal processing techniques, and external and internal flows. Papers are presented on intrablade velocity mapping in transonic fan passages of gas turbine, velocity measurements within boundary layer roughness using index matching, laser-based method for analyzing speed and vorticity, and a technique to measure the size of particles in laser Doppler velocimetry applications. Other topics discussed include experiments in polydisperse two-phase turbulent flows, filter induced errors in laser anemometry using counter-processor, and physical properties of separated flows behind two-dimensional bluff bodies in uniform flows. V.L.

### LASER ANEMOMETER MEASUREMENTS OF THE FLOW FROM A SIMULATED FUEL NOZZLE

D. R. ZIMMERMAN (General Motors Corp., Allison Gas Turbine Div., Indianapolis, IN) IN:. International Symposium on Laser Anemometry, 2nd, Miami Beach, FL, November 17-22, 1985, Proceedings . New York, American Society of Mechanical Engineers, 1985, p. 13-18. Research supported by General Motors Corp.

(Contract N00140-83-C-8894)

Two-color, two-dimensional, laser anemometer measurements were made of the axis-symmetric, swirling flow from a gas-turbine-engine, fuel-nozzle model. The flow field is characterized by two concentric, swirling, annular jets with an enclosed centerbody. The three mean velocity components, three normal stresses and two shear stresses were measured as a function of radial and axial location and Reynolds number for five geometrical configurations. The two most distinctly different geometries, co-rotating and counter-rotating annular jets, are discussed. Author

### ADVANCED TOPICS IN BOUNDARY ELEMENT ANALYSIS; PROCEEDINGS OF THE WINTER ANNUAL MEETING, MIAMI BEACH, FL, NOVEMBER 17-22, 1985

T. A. CRUSE, ED. (Southwest Research Institute, San Antonio, TX), A. B. PIFKO, ED., and H. ARMEN, ED. (Grumman Aerospace Corp., Bethpage, NY) Meeting sponsored by ASME. New York, American Society of Mechanical Engineers , 1985, 296 p. For individual items see A86-34443 to A86-34454.

The papers presented in this volume provide an overview of current developments in boundary element methodology. Topics discussed include stress analysis of gas turbine engine structures using the boundary element method, advanced three-dimensional dynamic analysis by boundary element methods, a recursive integration technique for boundary element methods in elastostaatics, and boundary element treatment of three-dimensional elastic fracture mechanics problems. Papers are also presented on error control in three-dimensional crack modeling using the boundary element method, adaptive mesh refinement techniques for boundary element methods, and parallel processing and the solution of boundary element equations. V.L.

### STRESS ANALYSIS OF GAS TURBINE ENGINE STRUCTURES USING THE BOUNDARY ELEMENT METHOD

R. B. WILSON, D. W. SNOW (United Technologies Corp., Engineering Div., Hartaford, CT), and P. K. BANERJEE (New York, State University, Buffalo) IN: Advanced topics in boundary element analysis; Proceedings of the Winter Annual Meeting, Miami Beach, FL, November 17-22, 1985 . New York, American Society of Mechanical Engineers, 1985, p. 45-63. refs

(Contract NAS3-23697)

The theory of the boundary element method is briefly reviewed with particular reference to the feasibility of elastic and inelastic three-dimensional stress analysis of complex structures characteristic of gas turbine engine components. Particular requirements of gas turbine analysis are defined, and examples of the use of a boundary element code designed for the three-dimensional stress analysis of turbine components are presented. It is shown that the general-purpose boundary element code can accurately and efficiently analyze many of the gas turbine engine structures. V.L.

### 757 MAJOR STATIC TEST INSTRUMENTATION SYSTEMS

J. P. WALLACE (Boeing Commercial Airplane Co., Seattle, WA) IN: 1985 SEM Spring Conference on Experimental Mechanics, Las Vegas, NV, June 9-14, 1985, Proceedings . Brookfield Center, CT, Society for Experimental Mechanics, Inc., 1985, p. 634-645.

Several instrumentation systems were designed and built to support the 757 Major Static Test Program. These systems included a 36 channel Sound Detection System, a 48 channel Inertia Detection System, an Airplane Attitude Display System and two large scale Data Acquisition and Display Systems capable of recording and displaying up to 1536 channels of data. Graphic displays were developed for plotting the test data on-line. CAD/CAM systems were used to produce strain gage location drawings. The supporting software that was developed and the graphic display systems resulted in significant cost savings over previous major test programs. Author

### PHOTOGRAMMETRY AS A MEANS OF MAPPING POSTBUCKLED COMPOSITE SURFACES

T. S. GATES (Rockwell International Corp., Los Angeles, CA) IN: 1985 SEM Spring Conference on Experimental Mechanics, Las Vegas, NV, June 9-14, 1985, Proceedings . Brookfield Center, CT, Society for Experimental Mechanics, Inc., 1985, p. 667-674. refs

Experimental results are discussed which indicate that nontopographic photogrammetry (NTP) can provide accurate, meaningful data for experimentally analyzing aspects of postbuckled structures. In particular, it is shown that the capability of NTP to supply data on initial imperfections, buckle geometry, edge effects, and transverse displacements exceeds the capability of moire or displacement transducers. By combining NTP with moire, strain gauges, and LDVTs, a complete and comprehensive data base can be formed to verify the analytical methodology required for efficient composite aircraft design. C.D.

### THE DEVELOPMENT OF A SYSTEM FOR THE STUDY OF FATIGUE CRACK GROWTH UP TO 2000 HZ

A. PETROVICH and W. BESSLER (Mechanical Technology, Inc., Latham, NY) IN: 1985 SEM Spring Conference on Experimental Mechanics, Las Vegas, NV, June 9-14, 1985, Proceedings . Brookfield Center, CT, Society for Experimental Mechanics, Inc., 1985, p. 682-687.

A system constructed for the study of fatigue crack growth under combined high/low cycle loading is described. Based on a voice coil electro-hydraulic servo-valve, the system was used to study fatigue crack growth in aircraft turbine disk alloy 718 under combined high and low cycle loading with a high cycle frequency up to 2000 Hz. A specimen was designed to minimize the frequency ranges over which dynamic stresses due to resonance are significant. The procedures for verifying the elimination of these dynamic stresses is described. The achievement of similar stress distributions over a range from 200 to 2000 Hz allowed observation of the frequency dependence of the transition from low cycle to high cycle dominated crack growth with varying high cycle stress intensity factor range. ### THE EFFECT OF CENTER DELAMINATION ON THE INSTABILITY OF COMPOSITE CYLINDRICAL PANELS

A. PALAZOTTO (USAF, Institute of Technology, Wright-Patterson AFB, OH) and G. SEIFERT IN: 1985 SEM Spring Conference on Experimental Mechanics, Las Vegas, NV, June 9-14, 1985, Proceedings . Brookfield Center, CT, Society for Experimental Mechanics, Inc., 1985, p. 707-711. refs

The buckling loads of 8-ply graphite-epoxy delaminated cylindrical panels were determined experimentally. The study included two different ply orientations, two different aspect ratios (length/chord), two different delamination sizes, and one set of boundary conditions; clamped along the top and bottom edges and simply supported along the vertical sides. The experimental test results were compared to the linear bifurcation loads obtained from the STAGSC-1 finite element computer code and the buckling loads of panels with square cutouts which were also obtained from STAGSC-1. **A WEIGHT METHOD FOR STRUCTUAL BOXES**

A. H. SCHMIDT (Boeing Vertul Co., Philadelphia, PA) Society of Allied Weight Engineers, Annual Conference, 44th, Arlington, TX, May 20-22, 1985. 17 p. refs

(SAWE PAPER 1680)

A fast and relatively simple method is described to predict the weight of aluminum wing and tail structural boxes simultaneously loaded for bending and torsion. The basic data were derived from an extensive compression testing study on stiffened panels of NACA 24S-T and 75S-T aluminum (identifical to current use 2024-T3 and 7075-T6. There are two equations, one for Z-stiffened 24S-T, and one for 75S-T. A graphite composite material was estimated for one structural configuration using the ratios of the modulus of elasticity for aluminum and graphite and the aluminum stiffened sheet curves. The method, which has its primary application to subsonic aircraft, yields accurate results. As in most weight estimating methods, good judgement is required in selecting the values for the nonoptimum factor, the rib material factor, and the effective height factor. I.S.

**A86-35225**

**AN OPTIMIZATION PROCEDURE FOR A REDUNDANT WING STRUCTURE**

L. A. RIEDINGER (Northrop Corp., Advanced System Div., Pico Rivera, CA) Society of Allied Weight Engineers, Annual Conference, 44th, Arlington, TX, May 20-22, 1985. 14 p.

(SAWE PAPER 1684)

A procedure is described whereby a minimum-weight wing may be obtained by calculating the optimum bending moment of inertia for each of the two spars (or boxes). This is accomplished by forcing each spar to support a proportionate amount of bending moment resulting in the maximum Mc/I stress equal to the damage tolerance allowable for the critical loading condition. The procedure described involves two initial analyses whereby an equation is obtained for the percent of bending in each spar as a function of the ratio of the moments of inertia. From this, a particular ratio of moments of inertia of the two spars is calculated to ensure that each spar is working to its allowable stress. According to the optimal stress theory, any other ratio would result in greater spar weight for bending. Three cases are used in the examples provided: constant height, same allowable stress; different heights, same allowable stress; and different heights, different materials; therefore, different allowable stresses. This procedure can save at least four weeks of design sizing iterations since it determines the optimum ratio of moments of inertia of the spars without iterations.

**GEARBOX CONFIGURATION ANALYSIS**

H. COCKING (Westland Helicopters, Ltd., Yeovil, England) IN: American Helicopter Society, Annual Forum, 41st, Fort Worth, TX, May 15-17, 1985, Proceedings . Alexandria, VA, American Helicopter Society, 1985, p. 153-161. refs

In the design of any new gearbox, a conflict arises as to whether the gearbox should have an epicyclic or parallel shaft output stage. A method is derived which enables the relative merits of the two systems to be compared and the weight of each accurately predicted in the design stage. The method shows the actual relationship between the various gear design variables and the gear weight. A new factor called the 'configuration factor' is identified, which dominates the prediction of gearbox weight. It is shown how this factor is used to assess gearbox designs and identifies three features common to any low-weight gearbox. Finally, combining these features in a semiskeletal case results in an Advanced Engineering Gearbox, with a weight of only 62 percent of the current comparable gearbox. Author

**POSTBUCKLING AND CRIPPLING BEHAVIOR OF GRAPHITE/EPOXY THIN-WALLED AIRFRAME MEMBERS**

A. D. REDDY and L. W. REHFIELD (Georgia Institute of Technology, Atlanta) IN: American Helicopter Society, Annual Forum, 41st, Fort Worth, TX, May 15-17, 1985, Proceedings . Alexandria, VA, American Helicopter Society, 1985, p. 609-615. Research supported by the United Technologies Corp. refs

(Contract DAAG29-82-K-0094)

Test specimens employing plain-woven C3000 graphite/epoxy with five different ply layup geometries are the bases of the present study of buckling, postbuckling and crippling behavior in graphite/epoxy thin walled I-section airframe structure members. Boundary conditions at the web/flange interface, postbuckling stiffnesses, and the crippling loads and modes are determined. Nondimensional crippling curves are presented, on the basis of the preliminary data obtained, which may be used for predicting the crippling strengths of similar material systems; these curves are compared with existing ones for metals. O.C.

**A86-35651**

**ASSESSMENT OF STRUCTURAL DAMAGE IN COMPOSITES UTILIZING ACOUSTIC EMISSION TECHNOLOGY**

W. C. BOYCE (United Technologies Corp., Sikorsky Aircraft Div., Stratford, CT) and R. K. MILLER (United Technologies Research Center, East Hartford, CT) IN: American Helicopter Society, Annual Forum, 41st, Fort Worth, TX, May 15-17, 1985, Proceedings . Alexandria, VA, American Helicopter Society, 1985, p. 665-677. refs

AE can be used in the quantitative characterization of structural damage in composite structures by means of a nonresonant point contact transducer (PCT), together with broadband signal processing; experimental results thus obtained have revealed unique signatures for matrix failures, delaminations, and fiber breaks. Attention is presently given to the development status and prospects for the application of PCT-based AE to full scale fatigue testing of helicopter dynamic components, as well as to the development of signal processing algorithms for the evaluation and tracking of structural damage propagation in composites.

O.C.

**A86-35658**

**ADVANCED STRUCTURAL CASTING APPLICATIONS FOR A GAS TURBINE ENGINE**

E. F. BISHOP, J. N. FLECK, and T. M. REGAN (General Electric Co., Lynn, MA) IN: American Helicopter Society, Annual Forum, 41st, Fort Worth, TX, May 15-17, 1985, Proceedings . Alexandria, VA, American Helicopter Society, 1985, p. 777-784.

Attention is given to the methods and results of a program to convert complex gas turbine engine structural elements into precision castings that do not compromise design function, weight, and performance characteristics. Significant cost reductions are noted to result from the obviation of materials and labor otherwise required for fabrication by other means; welding, brazing and other joining operations are eliminated, and the inventory of components and subassemblies is reduced. Illustrative examples are noted in the case of the T700 gas turbine helicopter engine family's investment castings. O.C.

**A86-35659**

**APPLICATION OF CLOSED-LOOP MACHINING IN THE MANUFACTURE OF GAS TURBINES**

S. M. BURGESS and M. H. WOLLOWITZ (General Electric Co., Aircraft Engine Business Group, Lynn, MA) IN: American Helicopter Society, Annual Forum, 41st, Fort Worth, TX, May 15-17, 1985, Proceedings . Alexandria, VA, American Helicopter Society, 1985, p. 785-791.

The in-process adaptive control system designated 'closed loop machining' (CLM), which employs machine-mounted probes to automatically correct process and machine errors, is presently applied to the manufacture of gas turbine components to reduce both manufacturing losses and product costs. The CLM system is incorporated into computer numerical control lathes. Attention is given to hardware concepts used in implementation, as well as to software design and programming requirements. The sources of probing system errors are discussed, together with comments on CLM systems obtained from machine operators, numerical control programmers, and production managers. O.C.

**A86-35660**

### ROBOTICS IN AIRCRAFT MANUFACTURING

J. J. BARTO, JR. (United Technologies Corp., Sikorsky Aircraft Div., Stratford, CT) IN: American Helicopter Society, Annual Forum, 41st, Fort Worth, TX, May 15-17, 1985, Proceedings . Alexandria, VA, American Helicopter Society, 1985, p. 793-800.

Attention is given to two robotic installations for the manufacture of helicopter airframe components: a small hole-drilling and deburring system, an assembly system for drill/wet-seal/rivet operations. The multistation drilling system employs a robot to drill pilot holes in a family of machined aluminum cabin frame structures, and also brush-deburrs the machined surfaces. The assembly system involves a track-mounted robot designed to drill, wet-seal, and rivet Kevlar and aluminum panels onto preassembled frames that are positioned in a work cell arrangement. O.C.

### THE EFFECT OF THE ELECTRODE GAP GEOMETRY ON CURRENT DISTRIBUTION DURING ELECTROCHEMICAL ROUNDING OF EDGES [VLIIANIE GEOMETRII MEZHELEKTRODNOGO PROMEZHUTKA NA RASPREDELENIE TOKA PRI ELEKTROKHIMICHESKOM SKRUGLENII KROMOK]

IU. M. VAKHITOV and A. KH. KARIMOV Aviatsionnaia Tekhnika (ISSN 0579-2975), no. 4, 1985, p. 20-24. In Russian.

In order to increase the reliability and life of gas-turbine engines it is necessary that sharp edges on some parts be rounded and then polished. The objective of the present study was to investigate the possibility of controlling current density by varying the shape and size of the working surface of the electrode tool and of the insulating screen during the electrochemical rounding of edges. Analog modeling using an electrointegrator has made it possible to obtain a number of practical recommendations concerning the design of the electrode tool and instrumentation. V.L.

**A86-35997**

### USING THE PERTURBATION METHOD FOR DETERMINING THE DIE FORGING PARAMETERS FOR AIRCRAFT PARTS [ISPOL'ZOVANIE METODA VOZMUSHCHENII PRI OPREDELENII TEKHNOLOGICHESKIKH PARAMETROV SHTAMPOVKI AVIATSIONNYKH DETALEI]

I. P. POPOV and V. D. MASLOV Aviatsionnaia Tekhnika (ISSN 0579-2975), no. 4, 1985, p. 93-96. In Russian.

The perturbation method with a series expansion of the solution in powers of the small operator is used to obtain simple analytical expressions for determining the principal process variables for the die forging of aircraft parts. The changes in the thickness of the part during the die forging operation are described in the form of a power-law function with allowance for the hardening of the material on the basis of the energy criterion of plasticity. The approach proposed here is demonstrated through an example. V.L.

### THE POSSIBILITY OF USING ION IMPLANTATION FOR INCREASING THE LIFE OF THE COMPRESSOR BLADES OF GAS-TURBINE AIRCRAFT ENGINES [O VOZMOZHNOSTI ISPOL'ZOVANIIA IONNOI IMPLANTATSII DLIA POVYSHENIIA DOLGOVECHNOSTI LOPATOK KOMPRESSORA GAZOTURBINNYKH AVIATSIONNYKH DVIGATELEI]

A. V. FEDOROV Aviatsionnaia Tekhnika (ISSN 0579-2975), no. 4, 1985, p. 96, 97. In Russian.

**A86-35999**

### SOME CHARACTERISTICS OF STRUCTURE FORMATION IN FORGED SEMIFINISHED PRODUCTS OF V93PCH ALUMINUM ALLOY [O NEKOTORYKH ZAKONOMERNOSTIAKH FORMIROVANIIA STRUKTURY V KOVANYKH POLUFABRIKATAKH IZ ALIUMINIEVOGO SPLAVA V93PCH]

A. IA. CHERNIAK, E. L. SHIF, and A. G. KARAKOZOVA Aviatsionnaia Tekhnika (ISSN 0579-2975), no. 4, 1985, p. 97-99. In Russian.

The formation of a local coarse-grained structure in forged semifinished products of V93pch, an Al-Zn-Mg-Cu alloy commonly used in aircraft engineering, is investigated as a function of the structure of the alloy (polygonized or recrystallized) prior to the final stage of forging, temperature, and the extent of deformation. It is found that the formation of coarse-grained zones in V93pch alloy is largely due to the nonuniformity of deformation and to the excessively wide temperature range of forging. In order to obtain a sufficiently fine-grained recrystallized structure, it is recommended that the temperature of the final stage of forging do not exceed 610 K. V.L.

**A86-36176**

### SOME ASPECTS OF VARIABILITY IN FATIGUE CRACK INITIATION AND PROPAGATION IN THICK ALUMINIUM ALLOY SECTIONS

J. Y. MANN, R. A. PELL, and A. S. MACHIN (Department of Defence, Aeronautical Research Laboratories, Melbourne, Australia) International Journal of Fatigue (ISSN 0142-1123), vol. 8, April 1986, p. 59-66. refs

As part of an investigation to extend the lives of wings of the Mirage IIIO aircraft, a fatigue testing program and extensive fractographic examination was undertaken on thick specimens representing the critical section of the spar to provide information on variability in fatigue crack initiation and propagation. A good linear relationship was found between the log life and log crack depth for individual specimens. At the smallest crack depth used for analysis (0.3 mm) no significant differences were found between the standard deviations of log life to crack initiation, for propagation or to final failure, nor in the corresponding standard deviations of arithmetic lives. However, in considering the more general question of whether the greater contribution to variability in total life comes from that in initiation life or that in propagation life, it is shown that account must be taken of the analytical basis of the assessment - whether arithmetic or logarithmic. ### THERMAL SCENE GENERATORS

A. PRITCHARD (British Aerospace, PLC, Research Dept., Bristol, England) Aerospace Dynamics (ISSN 0263-2012), vol. 18, Winter 1986, p. 17-22.

Design and performance features are discussed for Thermal Scene Generators (TSG) for hardware flight simulation testing of heat seeking missiles. The TSG must match the seeker's field of view, have a suitable range and resolution for the seeker design envelope, and have a response speed suitable for the trials run. The Bly cell, a thin membrane with favorable light absorption, thermal conductivity and emissivity properties, can be image-heated in a vacuum to a temperature corresponding to a visible image. A massive monolithic transducer can be employed to provide closed loop moving imagery through resistance heating. Sample imagery and circuitry diagrams are provided from experimental testing of the latter method by means of the application of thin film hybrid technology. M.S.K.

**ON THE METHODOLOGY OF AN INTERACTIVE COMPUTER-AIDED OPTIMAL DESIGN OF A DUAL-VALVE LINKAGE**
D. E. ARMY, JR. (United Technologies Corp., Hamilton Standard Div., Windsor Locks, CT), R. C. AZAR, and S. CHANDRASHEKHAR (Western New England College, Springfield, MA) IN: Computers in engineering 1985; Proceedings of the International Computers in Engineering Conference and Exhibition, Boston, MA, August 4-8, 1985. Volume 3 . New York, American Society of Mechanical Engineers, 1985, p. 339-345. refs

This paper presents a methodology for obtaining a set of on-line optimal dual-valve linkages using an interactive computer-aided design approach. The dual-valve linkage is used in aircraft environmental systems wherein airflow in two ducts is controlled using a common valve actuator. The throttle and the bypass valves must open or close a desired amount according to a design schedule, so an efficient synthesis method has to be employed. A least-squares method along with Freudenstein's equation is used to minimize an objective function and thereby reduce the difference between the desired output and the measured output over the domain of operation. The software package developed enables a user to interact with the computer to determine a number of alternative designs depending upon the weight, the torque ratios and the effective valve area. This allows the user to choose from a number of options in a relatively short period of time and thus significantly reduce the design time. Author

**IMPLICIT, VECTORIZABLE SCHEMES FOR THE FLUX-DIFFERENCE SPLIT, THREE-DIMENSIONAL NAVIER-STOKES EQUATIONS**
C. H. LIU, P.-M. HARTWICH, and C.-H. HSU (NASA, Langley Research Center, Hampton, VA) Chinese Aerodynamics Research Society, International Conference on Numerical Methods in Fluid Dynamics, 10th, Beijing, People's Republic of China, June 23-27, 1986, Paper. 4 p. refs

Two hybrid upwind models are defined for solving the Euler equations. The algorithms both employ approximate factorization (AF) in crossplane and symmetric block Gauss-Seidel relaxation in the third direction. One approach adds an additional factorization step to lower the number of required grid point operations for inversion of the block tridiagonal matrices; however, the move permits only one third of the operations to be vectorized. Finite difference solutions are calculated on a C-H-type grid, in this case enveloping a slender, sharp-edged delta wing. Sample data are provided for the calculated vortex flow for Re of 10,000, at a 20.5 deg angle of attack, represented in a crossflow velocity vector plot and in a spanwise pressure coefficient distribution. The AF scheme, without additional factorization, when used with a grid covering 51 x 51 x 72 points provides a convergent solution with no time step lasting longer than 0.00001 sec. M.S.K.

**CHARACTERISTICS PERTAINING TO A STIFFNESS CROSS-COUPLED JEFFCOTT MODEL**
K. L. SPANYER (NASA, Marshall Space Flight Center, Huntsville, AL) ASME, Conference and Exhibit on Mechanical Vibration and Noise, Cincinnati, OH, Sept. 10-13, 1985. 12 p. refs
(ASME PAPER 85-DET-144)

Rotordynamic studies of complex systems utilizing multiple degree-of-freedom analysis have been performed to understand response, loads, and stability. In order to understand the fundamental nature of rotordynamic response, the Jeffcott rotor model has received wide attention. The purpose of this paper is to provide a generic rotordynamic analysis of a stiffness cross-coupled Jeffcott rotor model to illustrate characteristics of a second order stiffness-coupled linear system. The particular characteristics investigated were forced response, force vector diagrams, response orbits, and stability. Numerical results were achieved through a fourth order Runge-Kutta method for solving differential equations and the Routh Hurwitz stability criterion. The numerical results were verified to an exact mathematical solution for the steady state response. Author

**TECHNIQUES FOR INCREASING THE UPDATE RATE OF REAL-TIME DYNAMIC COMPUTER GRAPHIC DISPLAYS**
W. M. KAHLBAUM, JR. (NASA, Langley Research Center, Hampton, VA) Association for Computing Machinery, SIGGRAPH 86, Dallas, TX, Aug. 18-22, 1986, Paper. 22 p.

This paper describes several techniques which may be used to increase the animation update rate of real-time computer raster graphic displays. The techniques were developed on the ADAGE RDS 3000 graphic system in support of the Advanced Concepts Simulator at the NASA Langley Research Center. The first technique involves pre-processing of the next animation frame while the previous one is being erased from the screen memory. The second technique involves the use of a parallel processor, the AGG4, for high speed character generation. The description of the AGG4 includes the Barrel Shifter which is a part of the hardware and is the key to the high speed character rendition. The final result of this total effort was a four fold increase in the update rate of an existing primary flight display from 4 to 16 frames per second. Author

**THE DEVELOPMENT OF LASER SPECKLE VELOCIMETRY FOR THE MEASUREMENT OF VORTICAL FLOW FIELDS**
C. A. SMITH (NASA, Ames Research Center, Moffett Field, CA), L. M. M. LOURENCO, and A. KROTHAPALLI (Florida State University, Tallahassee) AIAA, Aerodynamic Testing Conference, 14th, West Palm Beach, FL, Mar. 5-7, 1986. 15 p. refs
(AIAA PAPER 86-0768)

A new velocity measurement technique is described that provides the simultaneous visualization of a two-dimensional streamline pattern and the quantification of the velocity field. The main advantage of this technique is that the velocity field can be measured with sufficient accuracy and spatial resolution so that the vorticity field can be readily obtained. This technique is ideally suited for the study of unsteady vortical flows, which occur in rotorcraft and in high-angle-of-attack aerodynamics. The technique, some of the important parameters that affect its use, and some recent examples are described. Author

(Contract MOD-2037/0230/XR/STR)

A series of postbuckling tests have been conducted on thin rectangular quasi-isotropic CFRP panels. The testing machine allowed careful control of panel loading and by using acoustic emission as a diagnosis it was possible to monitor the onset and progress of failure before compression collapse destroyed the evidence. The panels exhibited substantial postbuckled strength, safely supporting at least twice their buckling load. Inspection of damaged panels revealed that postbuckling failure was caused by the rapid growth of edge delamination from positions corresponding to a node line in the buckled mode shape. Author

A design development has been presented of a damage tolerant composite multirib wing structural box section. A gradual advancing of the design through testing, evaluation of results and potential design modification at various specimen complexity levels has been applied here. This traditional building block approach is found to be valid and valuable. The specimen complexity levels include flat, simple coupons of a wide range of sizes and built-up wing cover panels with three and five stiffeners. The design development tests have demonstrated adequate damage tolerance of the blade-stiffened and the RTD I-stiffened designs. Findings from investigation of a premature fatigue failure of a moisture preconditional I-stiffened panel may cause its design modification. This design is used in the large box component whose tests are to qualify the component design and verify the composite damage tolerance requirements applied in designing the box. Author

The American Electronics Laboratory (AEL), Allaire, NJ, was tasked by the U.S. Army Avionics Research and Development Laboratory (SAVAA-M), Fort Monmouth, NJ, to develop replacement breadband matching modules for the CU-942B and the FM 10-30-1 antenna to satisfy specified requirements for Project SINCGARS. AEL was further tasked to test various candidate antennas provided by commercial vendors that are mechanically interchangeable with the CU-942B and the FM 10-30-1. After completion of the AEL development/test program, AVRADA tasked an independent, non-based Government antenna test facility to conduct prescribed antenna verification tests in accordance with an agreed upon test plan. This technical report describes communications antenna systems provided by Dayton-Granger, Inc (DGI), American Electronics Lab (AEL), and Avionics Antenna Systems (AVANT). The test measurements were conducted at the Naval Air Development Center, Antenna Test Facility located in Warminster, PA. The information in this report provides, in part, the technical data for the protection data package of adequate VHF-FM Communications antennas for the UH-1 helicopter when used with the new SINCGARS Radio. A computer based system utilizing an inexpensive off-the-shelf personal computer and original interface design centered around a 68000 microprocessor for real-time monitoring of a time division multiplexed pulse code modulated (TDM/PCM) data stream was designed and constructed. This system is a prototype of a low-cost, portable PCM data acquistion monitor intended for use in flight test programs by the 4950th Test Wing at Wright-Patterson AFB, Oh. It will accept a single Armed Forces Instrumentation Standard NRZ or split-phase (Manchester) baseband data stream at rates up to 100 KBPS, display selected data words in graphical or numerical format, and alarm the user when data exceeds certain limits. It will provide a real-time verification that the data being generated and recorded during a test is of acceptable quality, allowing the option of continuation of the test, or termination. The system is capable of automatically determining the data rate and signaling format and synchronizing itself with the incoming signal. GRA

**UNSTEADY HEAT TRANSFER AND DIRECT COMPARISON TO STEADY-STATE MEASUREMENTS IN A ROTOR-WAKE EXPERIMENT**
J. E. OBRIEN, R. J. SIMONEAU, J. E. LAGRAFF (Syracuse Univ.), and K. A. MOREHOUSE Jan. 1986 21 p refs Presented at the 8th International Heat Transfer Conference, San Francisco, Calif., 17-22 Aug. 1986
(NASA-TM-87220; E-2757; NAS 1.15:87220) Avail: NTIS HC A02/MF A01 CSCL 20D

Circumferentially local and time-resolved heat transfer measurements were obtained for a circular cylinder in crossflow located downstream of a rotating spoked wheel wake generator in a steady flow tunnel. The unsteady heat transfer effects were obtained by developing an extension of a thin film gauge technique employed to date exclusively in short-duration facilities. The time-average thin film results and conventional steady-state heat transfer measurements were compared. Time-averaged wake-induced stagnation heat transfer enhancement levels above the nowake case were about 10% for the four cylinder Reynolds numbers. This enhancement level was nearly independent of bar passing frequency and was related directly to the time integral of the heat transfer spikes observed at the bar passing frequency. It is observed that the wake-induced heat transfer spikes have peak magnitudes averaging 30 to 40% above the interwake heat transfer level. E.A.K.

**AN EXPERIMENTAL INVESTIGATION ON LOCATION OF BOUNDARY LAYER TRANSITION ON THE NACA 0012 USING SURFACE HOT FILM GAGES**
T. C. WANG Mar. 1986 10 p refs Transl. into ENGLISH from Acta Aeronautica et Astronautica Sinica, v. 5, no. 4, Dec. 1984 p 401-405 Original language document was announced in IAA as A85-43231 Transl. by SCITRAN, Inc., Santa Barbara, Calif. Original doc. was prep. by Nanjing Aeronautical Inst.
(Contract NASW-4004)
(NASA-TM-88285; NAS 1.15:88285) Avail: NTIS HC A02/MF A01 CSCL 20D

Hot film gages were attached flush to the upper surface of a NACA-type 0012 airfoil in order to locate the boundary layer transitions corresponding to a range of distances from the leading edge. The measurements were carried out in a low-speed wind tunnel at Nanjing Aeronautical Institute. During the wind-tunnel tests, Reynolds numbers were kept constant at 200,000 Re(b), while the angle of attack of the airfoil was varied continuously. The locations on the airfoil of boundary layer separation and turbulent boundary layer attachment are shown in a diagram. It is found that the location of boundary layer transitions using hot film gages is a feasible and practical technique. Author

**DUAL MODE HEAT EXCHANGER Patent Application**
F. E. ALTOZ, inventor (to Air Force) 3 Dec. 1985 18 p refs
(AD-D012156; US-PATENT-APPL-SN-804193) Avail: NTIS HC A02/MF A01 CSCL 20M

The invention comprises a compact, light weight, dual mode heat transfer device. The dual mode heat transfer device provides for air cooling of heat dissipating electronic components at moderate aircraft speeds and when available ambient air is below a preselected temperature. At elevated aircraft speeds when the ambient air temperature is above the preselected temperature a coolant liquid is converted to steam or vapor in order to cool the heat dissipating electronic components. A preferred embodiment of the invention includes a cold plate for conducting heat away from the heat dissipating components and radiator fins for dissipating cold plate heat to a air cooling flow. **REVIEW AND EVALUATION OF RECENT DEVELOPMENTS IN MELIC INLET DYNAMIC FLOW DISTORTION PREDICTION AND COMPUTER PROGRAM DOCUMENTATION AND USER'S MANUAL ESTIMATING MAXIMUM INSTANTANEOUS INLET FLOW DISTORTION FROM STEADY-STATE TOTAL PRESSURE MEASUREMENTS WITH FULL, LIMITED, OR NO DYNAMIC DATA Final Report**
W. G. SCHWEIKHARD and S. R. DENNON Apr. 1986 257 p refs
(Contract NAG3-11)
(NASA-CR-176765; NAS 1.26:176765) Avail: NTIS HC A12/MF A01 CSCL 20D

A review of the Melick method of inlet flow dynamic distortion prediction by statistical means is provided. These developments include the general Melick approach with full dynamic measurements, a limited dynamic measurement approach, and a turbulence modelling approach which requires no dynamic rms pressure fluctuation measurements. These modifications are evaluated by comparing predicted and measured peak instantaneous distortion levels from provisional inlet data sets. A nonlinear mean-line following vortex model is proposed and evaluated as a potential criterion for improving the peak instantaneous distortion map generated from the conventional linear vortex of the Melick method. The model is simplified to a series of linear vortex segments which lay along the mean line. Maps generated with this new approach are compared with conventionally generated maps, as well as measured peak instantaneous maps. Inlet data sets include subsonic, transonic, and supersonic inlets under various flight conditions. Author

Disclosed is a laser beam duct pressure controller system for maintaining a spatially uniform pressure in a flowing gas volume which is subjected to temporal pressure variations. This desired result is accomplished with cooperating structural components (and gases therein), which eliminate the axial flow of a conditioning gas within the laser beam duct by matching the time rate of change of the pressure of the flowing conditioning gas to the time rate of change of the pressure in the cavity of an operably associated laser beam turret. **SYSTEM LIFE AND RELIABILITY MODELING FOR HELICOPTER TRANSMISSIONS Final Report**
M. SAVAGE and C. K. BRIKMANIS Washington Apr. 1986 202 p refs
(Contract NAG3-55)
(NASA-CR-3967; E-2889; NAS 1.26:3967) Avail: NTIS HC A10/MF A01 CSCL 05C

A computer program which simulates life and reliability of helicopter transmissions is presented. The helicopter transmissions may be composed of spiral bevel gear units and planetary gear units - alone, in series or in parallel. The spiral bevel gear units may have either single or dual input pinions, which are identical. The planetary gear units may be stepped or unstepped and the number of planet gears carried by the planet arm may be varied. The reliability analysis used in the program is based on the Weibull distribution lives of the transmission components. The computer calculates the system lives and dynamic capacities of the transmission components and the transmission. The system life is defined as the life of the component or transmission at an output torque at which the probability of survival is 90 percent. The dynamic capacity of a component or transmission is defined as the output torque which can be applied for one million output shaft cycles for a probability of survival of 90 percent. A complete summary of the life and dynamic capacity results is produced by the program. Author

**TESTING OF YUH-61A HELICOPTER TRANSMISSION IN NASA LEWIS 2240-KW (3000-HP FACILITY**
A. M. MITCHELL, F. B. OSWALD, and F. T. SCHULLER Mar. 1986 28 p refs
(NASA-TP-2538; E-2801; NAS 1.60:2538) Avail: NTIS HC A03/MF A01 CSCL 01C

A helicopter transmission that was being considered for the Army's Utility Tactical Transport Attack System (UTTAS) was tested in the NASA Lewis 2240-kW (3000-hp) test facility to obtain the transmission's operational data. The results will form a vibration and efficiency data base for evaluation similar-class helicopter transmissions. The transmission's mechanical efficiency was determined to be 98.7 percent at its rated power level of 2080 kW (2792 hp). At power levels up to 113 percent of rated the transmission displayed 56 percent higher vibration acceleration levels on the right input than on the left input. Both vibration signature analysis and final visual inspection indicated that the right input spiral-bevel gear had poor contact patterns. The highest vibration meter level was 52 g's rms at the accessory gear, which had free-wheeling gearsets. At 113 percent power and 100 percent rated speed the vibration meter levels generally ranged from 3 to 25 g's rms. Author

**AUTOMATING KNOWLEDGE ACQUISITION IN A FLIGHTLINE ROBOT M.S. Thesis**
W. M. CLIFFORD Dec. 1985 170 p refs
(AD-A163829; AFIT/GE/ENG/85D-7) Avail: NTIS HC A08/MF A01 CSCL 06D

Robots enjoy widespread use in industry on simplistic repetitive tasks in a controlled environment. Tasks in the military domain, particularly the flightline, require mobility and intelligence. While the mobility issue is being addressed, the intelligence issue is not. By giving the robot the ability to learn from a novice, the robot could be placed on the flightline and learn what it needs to know from the domain experts. Rather than deal with a toy problem, this work takes the actual refueling Job Guides for two aircraft and shows how these can be used directly by a computer. The process involves three steps. First, the text is transformed into a common natural language processor form. Second, the forms are examined to allow the commonalty between the two refueling tasks to be extracted. The forms are expanded by applying expert system and planning techniques to include missing domain and world

knowledge. Finally, the forms are examined to allow the commanalty between the two refueling tasks to be extracted.

(Contract NAS3-23939)
(NASA-CR-174952; NAS 1.26:174952; PWA-5968-19) Avail: NTIS HC A09/MF A01 CSCL 14D

This report presents the results of the first year of a program designed to develop life prediction and constitutive models for two coated single crystal alloys used in gas turbine airfoils. The two alloys are PWA 1480 and Alloy 185. The two oxidation resistant coatings are PWA 273, an aluminide coating, and PWA 286, an overlay NiCoCrAlY coating. To obtain constitutive and/or fatigue data, tests were conducted on coated and uncoated PWA 1480 specimens tensilely loaded in the 100 , 110 , 111 , and 123 directions. A literature survey of constitutive models was completed for both single crystal alloys and metallic coating materials; candidate models were selected. One constitutive model under consideration for single crystal alloys applies Walker's micromechanical viscoplastic formulation to all slip systems participating in the single crystal deformation. The constitutive models for the overlay coating correlate the viscoplastic data well. For the aluminide coating, a unique test method is under development. LCF and TMF tests are underway. The two coatings caused a significant drop in fatigue life, and each produced a much different failure mechanism.

**CRACK GROWTH IN NEAR-ALPHA TITANIUM ALLOYS**
C. R. GOSTELOW *In* AGARD Damage Tolerance Concepts for Critical Engine Components 5 p Oct. 1985 refs
Avail: NTIS HC A13/MF A01

Ever since the first gas turbine aero engine entered into service there has been pressure to develop more powerful yet more efficient and lightweight units. To this end manufacturers have endeavored to increase overall pressure ratios and maximum cycle temperatures while trying to limit engine size by using materials having higher strength-to-weight ratios and higher temperature capability. Two main material approaches were followed in order to help meet these requirements. These are the development of high strength, high temperature capability nickel base superalloys for extensive use in the turbine and the replacement of heavy steels and nickel alloys in the compressor by advanced lightweight titanium alloys. The latter approach was the driving force behind the development in the UK of a unique range of creep-resistant near-alpha titanium alloys suitable for use up to 600 C. A variety of parameters are described which can influence the crack growth characteristics of near-alpha titanium alloys, with particular reference to the UK alloy IMI685. The relevance of these laboratory data to actual engine operation is assessed.

**SMALL DEFECT CHARACTERIZATION IN POWDER METALLURGY MATERIALS**
S. R. FIORENTIN and H. WALTHER (Fiat Aviazione S.p.A., Turin, Italy) *In* AGARD Damage Tolerance Concepts for Critical Engine Components 12 p Oct. 1985 refs
Avail: NTIS HC A13/MF A01

Powder metallurgy nickel base superalloys are becoming important structural materials for the manufacturing of critical complex-shaped aircraft components (e.g. turbine disks). Since fatigue life is largely affected by the presence of defects, in order to extend the limit of application of PM materials as far as possible, the need is felt for a nondestructive technique capable of detecting defects of size down to approximately 50 micrometers. An ultrasonic technique is presented which allows the detection and characterization of such small defects. It is based on the analysis of the signals backscattered by the material lying in the focal region of a short pulse transducer. During a first overall inspection of the component a real time data processing allows both the detection of critical defects and the evaluation of average grain size. In successive local inspections, confined in the regions where inclusions have been detected, further information on their characteristics may be collected. Some experimental results obtained on powder metallurgy samples containing seeded inclusions are presented.

**MULTIAXIAL AND THERMOMECHANICAL FATIGUE CONSIDERATIONS IN DAMAGE TOLERANT DESIGN**
G. E. LEESE and R. C. BILL (Army Research and Technology Labs., Cleveland, Ohio) *In* AGARD Damage Tolerance Concepts for Critical Engine Components 17 p Oct. 1985 refs
Avail: NTIS HC A13/MF A01

In considering damage tolerant design concepts for gas turbine hot section components, several challenging concerns arise: Complex multiaxial loading situations are encountered; thermomechanical fatigue loading involving very wide temperature ranges is imposed on components; some hot section materials are extremely anisotropic; and coatings and environmental interactions play an important role in crack propagation. The effects of multiaxiality and thermomechanical fatigue are considered from the standpoint of their impact on damage tolerant design concepts. Recently obtained research results as well as results from the open literature are examined and their implications for damage tolerant design are discussed. Three important needs required to advance analytical capabilities in support of damage tolerant design become readily apparent: (1) a theoretical basis to account for the effect of nonproportional loading (mechanical and mechanical/thermal); (2) the development of practical crack growth parameters that are applicable to thermomechanical fatigue situations; (3) the development of crack growth models that address multiple crack failures.

**TURBISTAN: A STANDARD LOAD SEQUENCE FOR AIRCRAFT ENGINE DISCS**
A. J. A. MOM, W. J. EVANS (Royal Aircraft Establishment, Farnborough, England), and A. A. TENHAVE *In* AGARD Damage Tolerance Concepts for Critical Engine Components 12 p Oct. 1985 refs
Avail: NTIS HC A13/MF A01

The development of TURBISTAN is a joint international effort to derive a loading standard representative for fighter aircraft engine disc usage. A representative loading standard offers considerable potential advantages over the present zero-max type of loading used for disc material evaluation. This is because the standard incorporates the effects of subcycles, their number, magnitude and sequence, which are known to seriously affect disc life and for which current life prediction techniques only partly account. Therefore usage of the standard in fatigue tests provides an improved evaluation of material properties, structural details, fabrication techniques, surface quality and life prediction. The compilation of operational flight data is described along with their analysis and the the generation of a preliminary TURBISTAN sequence for 'cold' compressor discs. The sequence contains about 8000 cycles which represent 100 flights. In addition, the background and philosophy of a material testing program meant to assess the effectiveness of the standard and to explore the validity of the assumptions made in its derivation is described.

**N86-25381#** Rolls-Royce Ltd., Derby (England).
**AN ANALYSIS OF RIG TEST DISC FAILURES**
G. ASQUITH *In* AGARD Damage Tolerance Concepts for Critical Engine Components 10 p Oct. 1985 refs
Avail: NTIS HC A13/MF A01

A major objective in gas turbine engineering is the design and manufacture of discs that are reliable in service. Much depends on the accurate prediction of safe total lives and inspection intervals. Accurate predictions come from a complete understanding of material behavior involving experimentation, interpretation and quantification, for which a balanced program of laboratory specimen and full sized disc evaluation is required. Cyclic testing of full size discs is essential, this allows each disc to do its own 'Monte Carlo' evaluation of the large number of variables that affect the final result. Where life can be predictd entirely by linear elastic fracture mechanics some simplification can be introduced; this encourages studies in the quantification of short crack propagation behavior. **NORMAL FORCE CHARACTERISTICS OF SHARP NOSED BODIES OF REVOLUTION AT HIGH ANGLES OF ATTACK IN SUBSONIC AND TRANSONIC FLOW Abstract Only**
X. TU and W. WU *In its* China Report: Science and Technology (JPRS-CST-86-011) p 102 31 Mar. 1986 Transl. into ENGLISH from Kongqidonglixue Xuebao (Mianyang, China), no. 4, 1985 p 81-89
Avail: NTIS HC A07/MF A01

The normal force characteristics of sharp nosed bodies of revolution were investigated experimentally at high angles of attack in a Mack number range form 0.35 to 1.20. The test results were analyzed. It was shown that both the Mach number and the Reynolds number strongly influence the normal force characteristics. The calculation methods based on crossflow theory had not taken into account the effects of viscosity and compressibility, so the actual phenomenon could not be represented. The present research also investigated the effect of rolling orientation on the normal force characteristics experimentally. It was shown that the vortex pattern on the leeside surface has a considerable effect on the normal force coefficient. The difference of the normal force coefficient for different rolling orientations is approximately the same as the magnitude of the Mack number effect. For sharp nosed bodies of revolution the vortex pattern on the leeside surface cannot be predicted precisely. For the same model, at the same angle of attack, the vortex pattern is different with different rolling orientations. Therefore, we can predict that the aerodynamic characteristics of sharp nosed bodies of revolution at high angles of attack should not be unique, and they can vary within a certain range. Author

T. KUZNETSOVA *In its* USSR Report: Engineering and Equipment (JPRS-UEQ-86-002) p 1-2 7 Feb. 1986 Transl. into ENGLISH from Pravda Ukrainy (Kiev, USSR), 26 May 1985 p 1
Avail: NTIS HC A06/MF A01

Development of the wide-body transport aircraft AN-124 is described. The aircraft has a large payload capacity, an airspeed of 800 to 850 kilometers an hour at an altitude of 10 to 12 kilometers, one third the fuel consumption, and the ability to use runways that are not concrete. The AN-124 is equipped with the latest navigation and piloting equipment, as well as an automated electrohydromechanical control system with quadruple redundancy, which ensures a high degree of reliability. The aircraft is also equipped with an onboard automatic monitoring complex which oversees all parameters, runs a comparison check, and warns ground services in the event of a malfunction. B.G.

Avail: NTIS HC A15/MF A01; also available from COSMIC, Athens, Ga. CSCL 20K

NASTRAN and COPES/CONMIN were used in the early-stage design optimization of a propeller and shaft. The work was undertaken, in part, to assess the performance of these programs for such a task. While the optimization was successful, some drawbacks to the approach surfaced and are discussed. Author

**FLUTTER ANALYSIS OF LOW ASPECT RATIO WINGS**
L. A. PARNELL *In* Computer Software Management and Information Center Fourteenth NASTRAN Users' Colloquium p 247-263 May 1986 refs
Avail: NTIS HC A15/MF A01; also available from COSMIC, Athens, Ga. CSCL 20K

Several very low aspect ratio flat plate wing configurations are analyzed for their aerodynamic instability (flutter) characteristics.

All of the wings investigated are delta planforms with clipped tips, made of aluminum alloy plate and cantilevered from the supporting vehicle body. Results of both subsonic and supersonic NASTRAN aeroelastic analyses as well as those from another version of the program implementing the supersonic linearized aerodynamic theory are presented. Results are selectively compared with the experimental data; however, supersonic predictions of the Mach Box method in NASTRAN are found to be erratic and erroneous, requiring the use of a separate program. **AN INTERCOMPARISON OF TURBULENCE DATA OBTAINED BY TWO AIRCRAFT DURING KONTUR**

A. GRANT (Meteorological Office, Bracknell, England) and S. ZANK (Hamburg, Universitaet, West Germany) Beitraege zur Physik der Atmosphaere (ISSN 0005-8173), vol. 59, Feb. 1986, p. 185-194. refs

To ensure that the data obtained by the two aircraft, the Falcon 20 and the Hercules C-130 which took part in the 1981 KonTur experiment, were compatible a number of side by side intercomparison runs were carried out. This paper concentrates on the results of a comparison of the turbulence data, to document the accuracy, as well as the limitations of aircraft measurements in present field studies. Agreement between velocity component power spectra is found to be within the limits of natural variability for independently measured data. Stress cospectra and covariances show good agreement. Agreement between corresponding temperature power spectra as well as between corresponding heat flux cospectra is poor. The corresponding humidity power spectra as well as flux cospectra show good qualitative agreement. Because of the lack of humidity fluxes from the intercomparisons the quantitative agreement is illustrated by humidity flux profiles. Author

**THE IMPORTANCE OF DYNAMIC STALL IN AERODYNAMIC MODELING OF THE DARRIEUS ROTOR [IMPORTANCE DU DECROCHAGE DYNAMIQUE DANS LES CALCULS AERODYNAMIQUES DU ROTOR DARRIEUS]**

P. FRAUNIE, C. BEGUIER (Aix-Marseille II, Universite, Marseille, France), and I. PARASCHIVOIU (Montreal, Universite, Montreal, Canada) Journal de Mecanique Theorique et Appliquee (ISSN 0750-7240), vol. 4, no. 6, 1985, p. 785-804. In French. refs

The CAARDEX program is defined for analyzing the behavior of Darrieus wind turbines in terms of the Reynolds number, the geometrical characteristics of the wind turbine and the spreading of the stream tubes traversing the rotor volume. It is demonstrated that the maximum power conversion efficiency of the Darrieus rotor is 0.4, with the energy capture being divided at a 4:1 ratio upstream to downstream rotor. The model shows that the velocity induced on the rotor is a function of the specific velocity and solidity, and that previous stream tube theories are valid only at low values of these parameters. CARDAAX treats the rotor disk in terms of horizontal slices of stream tubes modeled separately for the upstream and downstream segments. Account is taken of the velocity profile in the atmospheric boundary layer, which can vary significantly in the case of large wind turbines, i.e., several hundred feet high. When applied to predicting the performance of a 1 kW, 2.6 m diam prototype Darrieus wind turbine in a 10 mps flow, fair agreement is obtained for power capture/wind velocity and cyclic aerodynamic forces. Additional flow visualization data is provided to illustrate the production of turbulence in the form of vortices shed between the blades. M.S.K.

**PROBABILISTIC MODELING OF FIELDS OF ATMOSPHERIC TURBULENCE AND SEA ROUGHNESS WITH REFERENCE TO THE STUDY OF COMPLEX SYSTEMS [VEROIATNOSTNOE MODELIROVANIE POLEI TURBULENTNOSTI ATMOSFERY I MORSKOGO VOLNENIIA PRI ISSLEDOVANII SLOZHNYKH SISTEM]**

IU. I. PALAGIN, S. V. FEDOTOV, and A. S. SHALYGIN Radiotekhnika i Elektronika (ISSN 0033-8494), vol. 31, April 1986, p. 721-727. In Russian. refs

Simulation models of atmospheric turbulence and sea roughness are developed on the basis of parametric representations of random fields. The models do not exhibit errors in relation to the spectral-correlation characteristics, require a limited computation volume, and are convenient for implementation on both digital and analog processors. The present approach is applied to the statistical modeling of the motion-control system of a flight vehicle with a radar altimeter. Author

**COMPARISON OF ADVANCED TURBOPROP AND CONVENTIONAL JET AND PROPELLER AIRCRAFT FLYOVER NOISE ANNOYANCE - PRELIMINARY RESULTS**

D. A. MCCURDY (NASA, Langley Research Center, Hampton, VA) ASA, Meeting, 110th, Nashville, TN, Nov. 4-8, 1985, Paper. 30 p. refs

A laboratory experiment was conducted to compare the flyover noise annoyance of proposed advanced turboprop aircraft with that of conventional turboprop and jet aircraft. The effects of fundamental frequency and tone-to-broadband noise ratio on advanced turboprop annoyance were also examined. A computer synthesis system was used to generate 18 realistic, time varying simulations of propeller aircraft takeoff noise in which the harmonic content was systematically varied to represent the factorial combinations of six fundamental frequencies ranging from 67.5 Hz to 292.5 Hz and three tone-to-broadband noise ratios of 0, 15, and 30 dB. These advanced turboprop simulations along with recordings of five conventional turboprop takeoffs and five conventional jet takeoffs were presented at D-weighted sound pressure levels of 70, 80, and 90 dB to 32 subjects in an anechoic chamber. Analyses of the subjects' annoyance judgments compare the three categories of aircraft and examine the effects of the differences in harmonic content among the advanced turboprop noises. The annoyance prediction ability of various noise measurement procedures and corrections is also examined. Author

**AN ASSESSMENT OF DATA QUALITY AND QUANTITY FROM AIRBORNE CLOUD PHYSICS PROJECTS FROM 1974 THROUGH 1984 Final Report, Apr. 1983 - Dec. 1984**

R. K. JECK Dec. 1985 144 p refs

(Contract DTFA03-83-A-00309)

(DOT/FAA/CT-85/37; NRL-8951) Avail: NTIS HC A07/MF A01

Airborne cloud physics projects are reviewed to assess the quantity, quality, and availability of microphysical data from clouds above the freezing level. In particular, available information is analyzed to determine whether adequate data on supercooled liquid water content (SLWC) and snow currently exist for reliably characterizing aircraft icing conditions at altitudes up to 30,000 feet over the conterminous United States (CONUS). About 1700 flights in cold clouds over CONUS are documented, and the number and value of flights having data on SLWC, snow and other hydrometeors are tabulated. B.G.

**AFOS (AUTOMATION OF FIELD OPERATIONS AND SERVICES) TERMINAL FORECAST DECODING**
D. J. VERCELLI, G. A. NORMAN, and M. M. HEFFERNAN Oct. 1985 23 p
(PB86-147360; NOAA-NWS-TDL-CP-85-2) Avail: NTIS HC A2/MF A01 CSCL 04B

Terminal forecasts (FT's) are issued by Weather Service Forecast Offices (WSFO's) for approximately 500 airports nationwide. A regularly scheduled FT is valid for the 24-h period following its issuance. The FT's are prepared manually each day at WSFO's which have FT responsibilities. Once prepared, they are then stored in the local Automation of Field Operations and Services (AFOS) database and transmitted over the AFSO communications circuits. The information in the forecasts can also be used by various applications programs at the local office (e.g., Vercelli and Norman, 1985). To do this, however, the forecasts must first be decoded. The paper describes two formula translation (FORTRAN) subroutine programs which together with their subordinate subroutines can be used to decode FT's. GRA

**DFW (DALLAS-FT. WORTH) MICROBURST ON AUGUST 2, 1985**
T. T. FUJITA 1986 162 p
(Contract NGR-14-001-008; NA85AA-DR-064; NSF ATM-81-09828)
(NASA-CR-176794; NAS 1.26:176794; PB86-131638; SMRP-RP-217; LC-85-52386) Avail: NTIS HC A08/MF A01 CSCL 04B

The features of the microburst on August 2, 1985, related to the Delta 191 accident during the approach to Runway 17L of the Dallas-Ft. Worth Airport is described. Both radar and satellite data, along with ground-based measurements, were used in determining the characteristics of the parent cloud which spawned the most complicated microburst winds ever analyzed by the author. The detailed reconstruction of the airflow and the aircraft's maneuver were made possible by a series of computer analyses of the Digital Flight Data Recorder (DFDR) readout. Both measured and computed values in color diagrams that can be evaluated readily by meteorologists, pilots, structural engineers, and other interested persons in preventing microburst-related accidents in future years are presented. A. L. LIPPAY, M. KING, R. V. KRUK (CAE Electronics, Ltd., Montreal, Canada), and M. MORGAN (National Aeronautical Establishment, Ottawa, Canada) (CASI, Annual General Meeting, 32nd, Montreal, Canada, May 27, 1985) Canadian Aeronautics and Space Journal (ISSN 0008-2821), vol. 31, Dec. 1985, p. 335-345. refs

In a given control task, human error rate may increase in proportion to the number of control devices and mental transformations. A single device whose degrees of freedom coincide spatially with the principal task parameters, and whose dynamic characteristics provide a modicum of feedback representing the demands imposed on the system, should permit a reduction of the (human) control problem. A deflection-type side-arm controller developed in Montreal is described, which enables axis-by-axis or co-ordinated control in up to six degrees of freedom with one hand. The design minimizes unwanted inputs and cross-coupling between axes. Six-axis control was established in several spacecraft and manipulator simulations. A four-axis version has been installed in a research helicopter. Preliminary testing indicated good pilot acceptance, reduced training/familiarization requirements and - in some cases - significant improvement in control performance. A second generation engineering effort is currently in progress to produce high quality units for formal testing and eventual flight qualification. Author

**PILOT VEHICLE INTERFACES WITH SMART AVIONICS SYSTEMS**
L. D. POHLMANN, J. B. SHELNUTT, and J. D. GILMOUR (Boeing Military Airplane Co., Seattle, WA) IN: Aerospace Behavioral Engineering Technology Conference, 4th, Long Beach, CA, October 14-17, 1985, Proceedings . Warrendale, PA, Society of Automotive Engineers, Inc., 1985, p. 47-53. refs
(SAE PAPER 851923)

Design goals for the development of smart pilot vehicle interfaces (PVIs) are examined. The basic characteristics of smart PVIs and the pilot's role in combat aircraft are described. The need for the PVIs to anticipate pilot-system communication requirements, and the pilot/PVIs interaction required for evaluating situations are studied. Methods of presenting and regulating the PVIs information for the pilots are discussed. The ability of the PVIs to discuss abstract ideas such as strategy, risk, and tactics, and the use of direct communication of the pilot's intent to the avionics systems are proposed. I.F.

**AN INTEGRATED DISPLAY FOR VERTICAL AND TRANSLATIONAL FLIGHT EIGHT FACTORS AFFECTING PILOT PERFORMANCE**
J. S. TATRO (Bell Helicopter Textron, Fort Worth, TX) and S. N. ROSCOE (New Mexico State University, Las Cruces) Human Factors (ISSN 0018-7208), vol. 28, Feb. 1986, p. 101-120. refs
(Contract N00014-81-K-0439)

As part of an overall research program to optimize both forward-looking and downward-looking tactical situation displays for all-weather instrument flight in vertical takeoff and landing (VTOL) aircraft, an integrated horizontal situation display was developed for both vertical and translational flight. This paper covers the developed and initial experimentation of the downward-looking portion of the overall display and control system. The effects of eight factors on pilot performance were tested, and a multiple regression model of VTOL pilot performance as a function of those eight factors was derived for each of three dependent performance measures. Factors having important effects were position error magnification, control order, prediction time, control gain, tracking mode, and several of their interactions. Author

**THE USE OF ELLIPSOIDAL SOLIDS TO DISPLAY HUMAN BODY DYNAMIC RESPONSE**
D. H. LAANANEN and D. KALITA (Arizona State University, Tempe) IN: Computers in engineering 1985; Proceedings of the International Computers in Engineering Conference and Exhibition, Boston, MA, August 4-8, 1985. Volume 2 . New York, American Society of Mechanical Engineers, 1985, p. 11-17. refs
(Contract DOT-FA03-84-P-01649)

An algorithm for displaying the human body modeled as a set of ellipsoids with hidden lines omitted is described. The algorithm is implemented as a post-processor for a dynamic simulation of an aircraft occupant and seat in a crash environment. It includes consideration of complete penetration of one ellipsoid into another and total obscuration of one by another, features which are desirable for display of the abnormal body positions that can result in a vehicle crash. Also, interaction of the ellipsoids with the polygonal representations of the restraint system and seat has been considered. Results are illustrated by examples of output produced for an aircraft crash simulation. Author

**SIMULATION OF AIRCRAFT SEAT RESPONSE TO A CRASH ENVIRONMENT**
D. H. LAANANEN (Arizona State University, Tempe) IN: Computers in engineering 1985; Proceedings of the International Computers in Engineering Conference and Exhibition, Boston, MA, August 4-8, 1985. Volume 3 . New York, American Society of Mechanical Engineers, 1985, p. 241-246. refs
(Contract DOT-FA03-84-P-01649)

A three-dimensional mathematical model of an aircraft seat, occupant, and restraint system has been developed for use in analysis of light aircraft crashworthiness. Because of the significant role played by the seat in overall system crashworthiness, a finite element model of the seat structure is included. The seat model can accommodate large displacements, nonlinear material behavior, and local buckling of tubular elements. The occupant model consists of twelve segments whose dimensions and inertial properties have been determined from studies of human body anthropometry and kinematics and from measurements of anthropomorphic test dummies. The seat and occupant models are described, along with the simulation program, and some examples of output data are provided. Author

**THE ROLE OF FLIGHT SIMULATION IN HELICOPTER CREW STATION DESIGN**
J. N. DEMASI and H. P. HARPER (Sikorsky Aircraft, Stratford, CT) IN: Flight simulation/simulators; Proceedings of the Aerospace Technology Conference and Exposition, Long Beach, CA, October 14-17, 1985 . Warrendale, PA, Society of Automotive Engineers, Inc., 1985, p. 1-10. refs
(SAE PAPER 851900)

The need for simulation is assessed in the context of changing missions and technology; and the helicopter simulation facilities at the Sikorsky Aircraft Division are described in detail. These facilities include the human factors engineering laboratory, the avionics laboratory, the fixed-base simulator, the motion base simulator, and an in-flight simulator. It has been shown that simulation, an essential part of the crew station design process, can be applied at many levels. Simulator capabilities must cover a broad spectrum of fidelity levels with the capability to tie real hardware with the software simulation. It is concluded that in-flight simulation is necessary to provide realism for critical mission elements and to provide a validation of anchor points. Block diagrams are included. K.K.

**N86-25113#** Defence and Civil Inst. of Environmental Medicine, Downsview (Ontario).
**A REVIEW OF THE PILOT BACKACHE PROBLEM IN THE CH113 LABRADOR HELICOPTER**
A. BEACH Dec. 1985 26 p refs
(AD-A164011; DCIEM-85-R-49) Avail: NTIS HC A03/MF A01 CSCL 06S

In response to an Unsatisfactory Condition Report, complaints of back pain and discomfort induced by the pilots' seat of the CH113 Labrador helicopter were investigated. Several published reports dealing with the problem are reviewed and summarized in terms of incidence and prevalence rates, frequency, intensity, duration, location and time to pain onset. A questionnaire was developed and distributed to CH113 Labrador helicopter pilots in order to determine how closely the backache characteristics of the pilots match the characteristics reported by the general population. In addition, an evaluation of the size and shape of the Labrador seat was conducted and results were compared to published seat design guidelines and recommendations. Questionnaire results indicate that the typical backache reported by Labrador pilots is similar to the backache reported by other helicopter pilots. It is usually a dull pain in the lumbar area, most often experienced during flight and usually lasting after the mission ends. Subjective results also indicate that backache may be negatively correlated with regular exercise. Based on the symptoms identified in the questionnaire and the causes identified by other investigators, design principles for an improved seat incorporating an inflatable lumbar support and a more effective load bearing seat cushion were established. GRA

**A COMPLETELY INTEGRATED SYSTEM FOR THE TREATMENT OF CRACK GROWTH TEST DATA**

B. J. SCHWARTZ and D. T. HUNTER (United Technologies Corp., Pratt and Whitney, Div., West Palm Beach, FL) IN: 1985 SEM Spring Conference on Experimental Mechanics, Las Vegas, NV, June 9-14, 1985, Proceedings . Brookfield Center, CT, Society for Experimental Mechanics, Inc., 1985, p. 606-611. USAF-supported research. refs

The process of recording, analyzing, and modeling experimental data needed for fracture mechanics calculations is typically both time consuming and expensive. This paper describes the features and operation of a computer-assisted system, that is capable of automatically performing complete engineering analysis and documentation of crack growth test data. Author

**A86-35204**

**THE DEVELOPMENT OF AN ADVANCED WEIGHT ESTIMATION TECHNIQUE FOR AIRCRAFT CONCEPTUAL DESIGN**

M. J. LOGAN (LTV Aerospace and Defense Co., Vought Aero Products Div., Dallas, TX) Society of Allied Weight Engineers, Annual Conference, 44th, Arlington, TX, May 20-22, 1985. 14 p. (SAWE PAPER 1645)

The development of an advanced weight estimation methodology is necessary to keep pace with ever changing aircraft technology. One such method uses state-of-the-art computer concepts to provide flexible, accurate and comprehensive weight estimation capability. Using the proposed method, structural and nonstructural weights can be computed from the actual geometry of the aircraft, the materials used, and the various design, mission, and customer requirements information. Systems and equipment weights can be accurately assessed from a data library showing actual component applications. Accuracy can be ensured through the use of only those equation which are appropriate to the aircraft type being analyzed. It is concluded that with the advent of a completely interactive, menu driven system, the weight engineer's function is significantly altered. K.K.

**EIGENSTRUCTURE ASSIGNMENT: A TUTORIAL - I THEORY**

K. M. SOBEL (Lockheed California Co., Burbank) and E. Y. SHAPIRO (HR Textron, Inc., Valencia, CA) IN: 1985 American Control Conference, 4th, Boston, MA, June 19-21, 1985, Proceedings. Volume 1 . New York, Institute of Electrical and Electronics Engineers, 1985, p. 456-467. refs

A linear time invariant system and the output feedback eigenstructure problem are considered, taking into account a theorem which provides a solution to the problem. Attention is given to the problems of characterizing eigenvectors which can be assigned as closed-loop eigenvectors. Questions of feedback gain computation are explored, and aspects of constrained output feedback are discussed. A description of the application of eigenstructure assignment to flight control system design has been provided by Shapiro and Chung (1981), and by Andry et al. (1983). In this paper a review is presented of questions regarding the choice of eigenvectors for a stability augmentation system and for an autopilot for the lateral dynamics of an aircraft. The use of both output feedback and constrained output feedback is illustrated with the aid of an example. G.R.

**HIGH-SPEED, AUTOMATIC CONTROLLER DESIGN CONSIDERATIONS FOR INTEGRATING ARRAY PROCESSOR, MULTI-MICROPROCESSOR, AND HOST COMPUTER SYSTEM ARCHITECTURES**

S. A. JACKLIN, J. A. LEYLAND, and W. WARMBRODT (NASA, Ames Research Center, Moffett Field, CA) IN: 1985 American Control Conference, 4th, Boston, MA, June 19-21, 1985, Proceedings. Volume 3 . New York, Institute of Electrical and Electronics Engineers, 1985, p. 1223-1232. refs

Modern control systems must typically perform real-time identification and control, as well as coordinate a host of other activities related to user interaction, online graphics, and file management. This paper discusses five global design considerations which are useful to integrate array processor, multimicroprocessor, and host computer system architectures into versatile, high-speed controllers. Such controllers are capable of very high control throughput, and can maintain constant interaction with the nonreal-time or user environment. As an application example, the architecture of a high-speed, closed-loop controller used to actively control helicopter vibration is briefly discussed. Although this system has been designed for use as the controller for real-time rotorcraft dynamics and control studies in a wind tunnel environment, the controller architecture can generally be applied to a wide range of automatic control applications. **THE POSSIBILITY OF ACHIEVING HIGH PRODUCTIVITY WITH VECTOR-PIPELINE PROCESSORS IN SOLVING PROBLEMS OF MATHEMATICAL PHYSICS [O VOZMOZHNOSTIAKH DOSTIZHENIIA VYSOKOI PROIZVODITEL'NOSTI NA VEKTORNO-KONVEIERNYKH EVM PRI RESHENII ZADACH MATEMATICHESKOI FIZIKI]**

A. V. BABAKOV, O. S. BATSUKOV, O. M. BELOTSERKOVSKII, and L. N. STOLIAROV Zhurnal Vychislitel'noi Matematiki i Matematicheskoi Fiziki (ISSN 0044-4669), vol. 26, April 1986, p. 601-613. In Russian. refs

The paper examines aspects of the analysis of algorithms for solving problems of mathematical physics (e.g., of flow around aircraft structures) with the aim of programming these algorithms on vector-pipeline processors. The proposed method makes it possible to match the algorithm with the machine architecture, and to obtain a high-efficiency program. The proposed approach is demonstrated on a difference scheme for solving the problem of flow around a cylinder. The response-time characteristics of the program are evaluated, and it is shown that there is a five-fold increase in productivity as compared with a program obtained through translation from a high-level language. (Contract F33615-82-C-3604; F33615-83-C-3619)

An account is given of work of the Flight Dynamics Laboratory, which is sponsoring research on the use of systolic array processor concepts for real-time control computations for aircraft and spacecraft. The motivation for the work is given and progress is documented. To date, most of the work has focused on linear multivariable control problems. Several different linear multivariable control schemes are being implemented for vibration damping in a low-frequency cantilevered beam, at sample rates up to 2000 Hz, using the PC-1000 Systolic Array Processor. Additional work has begun on a 32-processor array optimized to solve nonlinear two-point boundary value problems (such as those occurring in flight control gain optimization) in real time. D.H.

**TOO LITTLE TIME - TOO LITTLE MONEY**

C. A. BOHN and B. J. LEIDEN (IBM Corp., Federal Systems Div., Owego, NY) IN: Flight simulation/simulators; Proceedings of the Aerospace Technology Conference and Exposition, Long Beach, CA, October 14-17, 1985 . Warrendale, PA, Society of Automotive Engineers, Inc., 1985, p. 29-34.

(SAE PAPER 851904)

An alternative to the high cost and long time associated with typical flight simulation efforts is proposed. A facility is described whereby low fidelity simulation is used early in a development program to provide empirical data for decision making in the design process. Five DOD mission tasks were identified for implementation: (1) assault, (2) antisubmarine warfare, (3) rescue, (4) scout, and (5) command and control. The underlying laboratory characteristic is reconfigurability, which is achieved in all areas via a modular approach and everything is simplified into basic components with flexibility in how the individual components are joined for any simulation. Computer operator crew station equipment and computer generation equipment together comprise the primary parts of the lab. A brief review of the experience gained in its first six months of use is provided with a simulation sample. K.K.

(SAE PAPER 851964)

This paper presents the impact of Ada on software engineering of simulation training equipment. The advantages of Ada as the programming language for Simulators are examined. The feasibility of the use of Ada for developing simulation software and the associated cost impact are discussed. Problem areas such as real-time issues, concurrency, data identification, multi-tasking, portability and reconfigurability of software are addressed. Author

**AN EMPIRICAL STUDY OF FLIGHT CONTROL SOFTWARE RELIABILITY Final Report**

J. R. DUNHAM and J. L. PIERCE Mar. 1986 46 p refs

(Contract NAS1-16489)

(NASA-CR-178058; NAS 1.26:178058; REPT-412U-2094-22)

Avail: NTIS HC A03/MF A01 CSCL 09B

The results of a laboratory experiment in flight control software reliability are reported. The experiment tests a small sample of implementations of a pitch axis control law for a PA28 aircraft with over 14 million pitch commands with varying levels of additive input and feedback noise. The testing which uses the method of n-version programming for error detection surfaced four software faults in one implementation of the control law. The small number of detected faults precluded the conduct of the error burst analyses. The pitch axis problem provides data for use in constructing a model in the prediction of the reliability of software in systems with feedback. The study is undertaken to find means to perform reliability evaluations of flight control software. E.A.K.

**COMPARISON OF ABSORPTION AND RADIATION BOUNDARY CONDITIONS USING A TIME-DOMAIN THREE-DIMENSIONAL FINITE DIFFERENCE ELECTROMAGNETIC COMPUTER CODE M.S. Thesis**

C. F. WILLIFORD Dec. 1985 186 p refs

(AD-A163828; AFIT/GE/ENG/85D-53) Avail: NTIS HC A09/MF A01 CSCL 20C

The Three-Dimensional Finite Difference (3DFD) computer code is compared using Absorption Boundary Conditions (ABS) versus Radiation Boundary Conditions (RBC). This comparison is made when the 3DFD code is used to study the interaction of lightning with an aircraft. The 3DFD computer code is a modified version of Rymes' 3DFD. The aircraft modeled for the paper is and F-16 Fighting Falcon. The ABC used simulates an infinite free-space by setting the conductivity of the boundary space to that of distilled water, to absorb the outgoing electromagnetic waves. The RBC simulates free-space by assigning the boundary fields to a previously calculated value. The value is calculated with a parabolic interpolation of three previous field values, which are offset in space. Therefore, the calculated value is also extrapolated to account for the time delay and position change. The results of incorporating RBC were dramatic. The ten locations sampled for the test showed marked improvement in the waveforms when using RBC's. Depending on the purpose of the analysis, this improved waveform output may be overshadowed by the 25% increase in CPU time that is needed for the more sophisticated RBC. GRA

This project involved studying the real-time avionics environment in which Ada will become the primary programming language in the near future. A set of issues of concern regarding the use of Ada within this environment was identified and described. Test programs, including the new Prototype Ada Compiler Evaluation Capability, were evaluated as to their applicability to these issues. The applicable test program were compiled and executed using two validated Ada compilers. Compile time and run time statistics were gathered to form a baseline against which other Ada compilers (preferably MIL-STD-1750a Ada compilers) may be compared. GRA

**THEORETICAL THREE-AND FOUR-AXIS GIMBAL ROBOT WRISTS**
L. K. BARKER and J. A. HOUCK May 1986 38 p refs
(NASA-TP-2564; L-16042; NAS 1.60:2564) Avail: NTIS HC A03/MF A01 CSCL 09B

In high-performance flight simulations, a four-axis gimbal system allows all possible rotations with acceptable gimbal angle rates while it avoids the so-callled 'gimbal lock' that occurs when gimbal rotational axes are colinear. In this paper, pertinent equations (including quaternions) are assembled for a hypothetical robot wrist, functionally equivalent to this four-axis gimbal system, and also for a true three-axis gimbal robot wrist. These equations are used to simulate the rotation of a robot hand by the robot wrist in response to operator rotational velocity commands to the robot hand. Near gimbal lock (wrist singularity), excessive rotational rates occur. Scaling the rates, which is necessary for the three-gimbal robot wrist to prevent rate limiting, introduces an undesirable time delay in the robot hand rotation with respect to the commanded rotation. However, the merit of the four-gimbal robot wrist is that the fourth gimbal angle keeps the robot wrist away from the singularity so that the robot hand moves exactly as commanded. It appears that in a 'worst-type' maneuver of the robot hand, the fourth gimbal angle can be defined so that none of the gimbal angle rates exceed about twice the commanded rates. Author

A self-organizing controller is developed for a simplified two-dimensional aircraft model. The Controller learns how to pilot the aircraft through a navigational mission without exceeding pre-established position and velocity limits. The controller pilots the aircraft by activating one of eight directional actuators at all times. By continually monitoring the aircraft's position and velocity with respect to the mission, the controller progressively modifies its decision rules to improve the aircraft's performance. When the controller has learned how to pilot the aircraft, two actuators fail permanently. Despite this malfunction, the controller regains proficiency at its original task. The experimental results reported show the controller's capabilities for self-organizing control, learning, and malfunction recovery. Author

This thesis examines the feasibility and a method of extending continuous domain Quantitative Feedback Theory (QFT) flight control system designs to the discrete domain. The results of two previous QFT analog design efforts are modified for a digital implementation. The first design effort is for the KC-135 transport aircraft. Robust analog fixed compensators are designed for three different flight conditions. The second design effort is for the AFTI/F-16 aircraft. In this design, parameter variation is due to both varying flight conditions and different aircraft configurations caused by failed surfaces. GRA

This project produced a run-time math library for the MIL-STD-1750A embedded computer architectures. The math library consists of the algebraic functions. In addition, the steps required for a performance analysis of the math library have been outlined. Several approximation methods were investigated. The Chebyshev Economization of Maclaurin series polynomials, and rational approximations derived from the second algorithm of Remes were determined to be the best methods available. Each function's implementation was designed to take advantage of features MIL-STD-1750A architectures. The recommended test procedures provide measures of the average and worst case generated errors within each approximation. Author (GRA)

The aspect of Robustness for linear multivariable systems in time domain is the central theme of the research under the present contract. Upper bonds on the linear, structured, time varying perturbation of an asymptotically stable linear time invariant regulator are obtained to maintain both stability and acceptable regulation, using Lyapunov approach. Improvement of the proposed measures over existing measures is illustrated with the help of examples. It is shown that by employing a scaling transformation on the nominal system, it is possible to further improve the upper bound. The proposed Perturbation Round Analysis is used to design robust controllers for Linear Quadratic Regulators with structured uncertainity. Introducing quantitative measures called Stability Robustness Index and Performance Robustness Index, design algorithms are presented by which one can achieve a trade off between nominal performance, stability robustness and performance robustness. Applications considered include aircraft control problems, large space structure control problems having uncertain modal data and mode truncation as the perturbations. GRA

**SIMULATION PROBLEM OF CONTROLLING LATERAL MOVEMENT OF AIRCRAFT DURING LANDING APPROACH Abstract Only**
N. D. BOTKIN, V. M. KEYN, and V. S. PATSKO *In its* USSR Report: Physics and Mathematics (JPRS-UPM-86-001) p 69-70 21 Jan. 1986 Transl. into ENGLISH from Prikladnaya Matematika i Mekhanika (Moscow, USSR), v. 48, no. 4, Jul. - Aug. 1984 p 560-567
Avail: NTIS HC A05

The problem of controlling lateral movement of an aircraft in the final phase of landing under windy condition is investigated. A vector differential equation is derived to describe the lateral movement of an aircraft in linear approximation. The problem is formalized as an antagonistic positional differential close-end game between two players with a convex payoff function. The controlling parameter of the first player is a scalar, so that a universal stable optimum strategy exists for the first player. The movements of the initial system of equations are modeled for the initial conditions of one of the parameters at the moment T sub o = 0. It is found that a linear control principle does not guarantee a successful landing approach under extreme perturbation, but that a combined method does provide such a guarantee. Linear control likewise does not guarantee a successful landing in the absence of extreme perturbations if initial deviations, which the combined control principle can handle, are large. Author

Avail: NTIS HC A05

Optimization of the measurement processing algorithm employed in automated air traffic control systems is investigated with respect to such observation parameters as the number of measurements processed, the digitization interval and the weighted coefficients of the algorithm. The longitudinal and lateral components of the ground speed vector are calculated by the least squares method, using a linear approximation function. The variance of the approximating function in the region of the airport is defined as the efficiency indicator in the problem of parametric optimization of the traffic control algorithm. The approach employed makes it possible to make maximum use of the capabilities of existing automated air traffic control systems and to improve ground speed determination accuracy. Author

**WEAKLY NONLINEAR ACOUSTIC AND SHOCK-WAVE THEORY OF THE NOISE OF ADVANCED HIGH-SPEED TURBOPROPELLERS**
C. K. W. TAM (Florida State University, Tallahassee) and M. SALIKUDDIN (Lockheed-Georgia Co., Marietta) Journal of Fluid Mechanics (ISSN 0022-1120), vol. 164, March 1986, p. 127-154. Research supported by the Lockheed-Georgia Independent Research and Development Program. refs

The problem of the acoustic field generated by a supersonic turbopropeller is formulated and solved as a boundary-value problem with the equations of motion of an inviscid compressible fluid used as the governing equations. In the blade-fixed cylindrical coordinate system used here, the disturbance field is time independent so that the solution is a function of the spatial coordinate alone; the problem is further simplified by adopting the thin-airfoil approximation. Weakly nonlinear propagation effects are incorporated into the solution following Whitham's (1974) nonlinearization procedure. Numerical results of the present theory are compared with the measurements of the Jetstar flight experiment and low-cruise Mach number open-wind-tunnel data, and good overall agreement is found. M. KALLERGIS (DFVLR, Institut fuer Entwurfs-Aerodynamik, Brunswick, West Germany) DGLR, Jahrestagung, Bonn, West Germany, Sept. 30-Oct. 2, 1985. 20 p. In German.
(DGLR PAPER 85-112)

An understanding of the relations between operative and blade-geometrical parameters, and the resulting acoustic pressure/time signal is of particular importance for the successful development of a quiet propeller drive. This report presents experimental data which can contribute to a solution of the considered problem. Studies on the basis of measurements utilizing passing flight conditions in the free atmosphere make it possible to avoid certain difficulties which arise in wind-tunnel investigations. Measurements regarding the remote acoustic radiation field were conducted with the aid of a research aircraft and a glider. The glider was employed for the storage of acoustic signals and distance measurements. Supplementary near-field measurements were performed with another research aircraft. In this case, a microphone-array system at the wing was utilized. Details regarding the employment of gliders in the considered acoustic investigations are discussed, and a description is given of the approach employed to separate engine noise and propeller noise in near-field measurements. **THE ROLE OF SCALE MODELS IN THE DESIGN OF 'LOW BVI NOISE' ROTORCRAFT**
K. R. SHENOY (United Technologies Corp., Sikorsky Aircraft Div., Stratford, CT) IN: American Helicopter Society, Annual Forum, 41st, Fort Worth, TX, May 15-17, 1985, Proceedings . Alexandria, VA, American Helicopter Society, 1985, p. 239-248. refs

Results from two scale model rotor acoustic tests conducted in the NASA 4mX7m wind tunnel and the United Technologies Acoustic Research Tunnel are presented to illustrate the effects of scale, blade tip shapes, thrust and flight parameters on the acoustic characteristics of helicopter rotors. The Blade-Vortex-Interaction noise is shown to be a discrete noise source which significantly affects the mid-frequency region. Further, the effect of Reynold's number at 1/20 scale is shown to be significant. The results also show that the Blade-Vortex-Interaction noise can be controlled by proper blade tip design and by undertaking proper flight procedures. Author

A study was made of helicopter tail rotor noise, particularly that due to interactions with the wakes of the main rotor, hub, and fuselage, and with the engine exhaust. Both harmonic and broadband noise were analyzed. The disturbed flow into the tail rotor was modeled using combinations of aerodynamic and acoustic flow codes along with some necessary estimates of turbulence properties. Representative calculations show that the main rotor wake is the strongest contributor to both harmonic and broadband tail rotor noise. The fuselage separation wake and the engine exhaust flow are also very important to both harmonic and broadband noise. The hub and hub-shaft wakes are important contributors to the broadband noise only. The tip vortices do not seem to be important to broadband noise, but their effects on harmonic noise were not modeled accurately enough to draw any conclusions from this study. Author

**FAA/HAI HELICOPTER FLIGHT OPERATIONS NOISE TESTS AND INITIAL RESULTS**

S. A. YOSHIKAMI (FAA, Washington, DC) and C. R. COX (Bell Helicopter Textron, Fort Worth, TX) IN: American Helicopter Society, Annual Forum, 41st, Fort Worth, TX, May 15-17, 1985, Proceedings . Alexandria, VA, American Helicopter Society, 1985, p. 263-275. refs

This paper discusses a noise test program of eight helicopters conducted jointly by the Federal Aviation Administration and the Helicopter Association International. The program emphasized the gathering of helicopter operational noise data and information appropriate to en route and heliport land use planning. The tests are described highlighting the extensive data acquisition systems used and the varied flight operations studied. Noise levels and acoustic directivity characteristics of the eight helicopters are presented for each flight operation. Trends in the data established by these characteristics are used to identify noise abatement operational procedures. Some of the procedures are shown to be applicable to all helicopter types, while others are configuration specific. Author

(Contract NAG2-182)

A novel data acquisition system has been designed which allows a transfer of pressure transducer and hot film data from a rotating frame to a stationary one, while collecting both loading and far field acoustic measurements simultaneously; this permits correlations to be made between experimental and theoretical predictions of blade loads and the resulting far field acoustics. The comparison of predicted acoustic pulse with experimental measurements has verified the assumptions made in the Widnall and Wolf (1980) theory for the case of low speed incompressible flow. The theory is also shown to be very sensitive to the interaction geometry and trajectory of the blade trailing vortex. O.C.

**HELICOPTER ROTOR NOISE DUE TO INGESTION OF ATMOSPHERIC TURBULENCE Final Report**

J. C. SIMONICH, R. K. AMIET, R. H. SCHLINKER, and E. M. GREITZER (Massachussetts Inst. of Technology, Cambridge) Washington NASA May 1986 150 p refs

(Contract NAS1-17096)

(NASA-CR-3973; NAS 1.26:3973) Avail: NTIS HC A07/MF A01 CSCL 20A

A theoretical study was conducted to develop an analytical prediction method for helicopter main rotor noise due to the ingestion of atmospheric turbulence. This study incorporates an atmospheric turbulence model, a rotor mean flow contraction model and a rapid distortion turbulence model which together determine the statistics of the non-isotropic turbulence at the rotor plane. Inputs to the combined mean inflow and turbulence models are controlled by atmospheric wind characteristics and helicopter operating conditions. A generalized acoustic source model was used to predict the far field noise generated by the non-isotropic flow incident on the rotor. Absolute levels for acoustic spectra and directivity patterns were calculated for full scale helicopters, without the use of empirical or adjustable constants. Comparisons between isotropic and non-isotropic turbulence at the rotor face demonstrated pronounced differences in acoustic spectra. Turning and contraction of the flow for hover and low speed vertical ascent cases result in a 3 dB increase in the acoustic spectrum energy and a 10 dB increase in tone levels. Compared to trailing edge noise, turbulence ingestion noise is the dominant noise mechanism below approximately 30 rotor harmonics, while above 100 harmonics, trailing edge noise levels exceed turbulence ingestion noise by 25 dB. **AN ESTIMATE OF THE ENROUTE NOISE OF AN ADVANCED TURBOPROP AIRPLANE NASA-TM-87302 E-3020 NAS 1.15:87302 HC A02/MF A01**

J. H. DITTMAR Apr. 1986 24 p refs

(NASA-TM-87302; E-3020; NAS 1.15:87302) Avail: NTIS HC A02/MF A01 CSCL 20A

The enroute noise of an Advanced Turboprop powered aircraft was estimated. The measured noise levels were roughly equivalent in annoyance to the noise 15.24 m from an automobile traveling at 80 km/h. It is felt that these levels would not illicit noise complaints from urban areas during the day but might be a slight annoyance in rural areas or in urban areas at night. Although it is not felt that the enroute noise is a major problem, it is indicated that a reduction in the enroute noise could improve the acceptability of advance turboprop airplanes. Author

**AN EXPERIMENTAL INVESTIGATION OF REDUCING ADVANCED TURBOPROP CABIN NOISE BY WING SHIELDING**

J. H. DITTMAR 1986 37 p refs Presented at the 10th Aeroacoustics Conference, Seattle, Wash., 9-11 Jul. 1986; sponsored by AIAA

(NASA-TM-87112; E-2713; NAS 1.15:87112) Avail: NTIS HC A03/MF A01 CSCL 20A

An experimental investigation was undertaken to determine if wing shielding could reduce the noise impacting the fuselage of an advanced turboprop airplane. Four wings were tested behind two eight-bladed propeller models. Significant shielding of the propeller noise was observed and a particular wing-propeller geometry was identified to provide the most shielding. Specifically, an up-inboard rotation would be needed for a low-wing airplane and a down-inboard rotation for a high-wing airplane. As the axial Mach number was increased, the position where the shielding starts moved farther downstream. This shift in the start of shielding was roughly a straight line with respect to Mach number between M = 0.7 and M = 0.8. At M = 0.85 the start of shielding does not shift any farther downstream. A simple barrier noise-reduction model gave the same trends with transducer positions as did the data, and, if corrected for Mach number shift, the model might be used to provide estimates of the wing shielding. Besides providing a barrier to the noise reaching the shielded area, the wing also reflects some of the noise back onto the unshielded area. This can make the noise difference between the unshielded and shielded areas of the fuselage larger than would be expected by simple wind shielding. Author

The prediction sequence used in the aircraft noise prediction program (ANOPP) is described. The elements of the sequence are called program modules. The first group of modules analyzes the propeller geometry, the aerodynamics, including both potential and boundary-layer flow, the propeller performance, and the surface loading distribution. This group of modules is based entirely on aerodynamic strip theory. The next group of modules deals with the first group. Predictions of periodic thickness and loading noise are determined with time-domain methods. Broadband noise is predicted by a semiempirical method. Near-field predictions of fuselage surface pressrues include the effects of boundary layer refraction and scattering. Far-field predictions include atmospheric and ground effects. Author

P. J. W. BLOCK Apr. 1986 33 p refs Original contains color illustrations

(NASA-TP-2541; L-16046; NAS 1.60:2541) Avail: NTIS HC A03/MF A01 CSCL 20A

Measurements which are required to define the directivity and the level of propeller noise were studied. The noise radiation pattern for various single-rotation (SR) propeller and counter-rotation (CR) propeller installations were mapped. The measurements covered + or - 60 deg from the propeller disk plane and + or - 60 deg in the cross-stream direction. Configurations examined included SR and CR propellers at angle of attack and an SR pusher installation. The increases in noise that arise from an unsteady loading operation such as an SR pusher or a CR exceeded 15 dB in the forward axial direction. Most of the additional noise radiates in the axial directions for unsteady loading operations of both the SR pusher and the CR tractor. E.A.K.

**HELICOPTER TAIL ROTOR NOISE ANALYSES Final Technical Report, 1 Jun. 1985 - 31 Jan. 1986**

A. R. GEORGE and S. T. CHOU Jan. 1986 66 p refs

(Contract NAG1-590)

(NASA-CR-176829; NAS 1.26:176829) Avail: NTIS HC A04/MF A01 CSCL 20A

A study was made of helicopter tail rotor noise, particularly that due to interactions with the main rotor tip vortices, and with the fuselage separation mean wake. The tail rotor blade-main rotor tip vortex interaction is modelled as an airfoil of infinite span cutting through a moving vortex. The vortex and the geometry information required by the analyses are obtained through a free wake geometry analysis of the main rotor. The acoustic pressure-time histories for the tail rotor blade-vortex interactions are then calculated. These acoustic results are compared to tail rotor loading and thickness noise, and are found to be significant to the overall tail rotor noise generation. Under most helicopter operating conditions, large acoustic pressure fluctuations can be generated due to a series of skewed main rotor tip vortices passing through the tail rotor disk. The noise generation depends strongly upon the helicopter operating conditions and the location of the tail rotor relative to the main rotor. Author

**HELICOPTER CUSTOMER SUPPORT - ARE WE AWARE OF HOW GREAT IT CAN BE**

J. J. ALEXANDER (Aerospatiale Helicopter Corp., Grand Prairie, TX) IN: American Helicopter Society, Annual Forum, 41st, Fort Worth, TX, May 15-17, 1985, Proceedings . Alexandria, VA, American Helicopter Society, 1985, p. 617-622. refs

Helicopter manufacturers' customer support services encompass the provision of spare parts, maintenance and repair equipment, and technical expertise, to customers on the basis of analyses of product histories. The manufacturer must address the service requirements of pilots, maintenance personnel, and spare parts inventory managers, in addition to members of administrative and financial departments. Attention is presently given to support service requirement information flowing from customers to manufacturers, typical product accident/incident cause analysis, and both obvious and hidden expenditures by customers that must be anticipated by support services. O.C.

**THE FIELD REPRESENTATIVE 'FRONT LINE ACTIONEER'**

W. G. TRIPP (United Technologies Corp., Sikorsky Aircraft Div., Stratford,, CT) IN: American Helicopter Society, Annual Forum, 41st, Fort Worth, TX, May 15-17, 1985, Proceedings . Alexandria, VA, American Helicopter Society, 1985, p. 623-627.

A helicopter manufacturer's field service representative must address the maintenance, operation and support requirements of customers operating one or several of the manufacturer's products. In addition to the technical expertise required to soundly advise operators on cost-minimizing procedures in operations, maintenance and repair, the representative must also possess and exercise evaluative judgment through which the manufacturer's staff can act on customers feedback. The degree to which a field service representative's work will enhance customer performance and satisfaction is presently assessed. O.C.

**A86-35647**
**SPARE PARTS PRICING - IMPACT ON LOGISTICS SUPPORT**
J. K. HANCOCK (Boeing Vertol Co., Ridley Park, PA) IN: American Helicopter Society, Annual Forum, 41st, Fort Worth, TX, May 15-17, 1985, Proceedings . Alexandria, VA, American Helicopter Society, 1985, p. 635-637.

A task force composed of management-level representatives from all major organizations of a military helicopter manufacturer was formed in response to a 10-point program, promulgated in July 1983 by the Secretary of Defense, in order to reform spare parts procurement practices. A corporate spares policy was duly formulated by October 1983. Attention is given to the effects of this policy on price lists, recommended minimum quantities, combined buy practices, low intrinsic value spares, ground support equipment, spare parts data tracking, and cost avoidance. O.C.

**N86-25300#** Army Aviation Systems Command, St. Louis, Mo.
**COST ESTIMATING RELATIONSHIPS FOR FIXED WING AIRCRAFT: LIST PRICE VERSUS EMPTY WEIGHT Final Report**
W. J. DITTO Sep. 1985 15 p refs
(AD-A164196; USAAVSCOM-TM-85-F-7) Avail: NTIS HC A02/MF A01 CSCL 15E

This Cost Estimating Relationship (CER) for fixed wing aircraft was developed to estimate the unit cost of a twin engine, commercial, turboprop aircraft procured off the shelf. The Army has a limited fixed wing capability and most of this capability is procured in a commercial environment instead of through a typical rotor wing procurement cycle. The list price in the commercial market includes both engines and standard avionics, while in a typical government rotor wing procurement these items are Government Furnished Equipment. Therefore, this CER was developed using the parameter of empty weight and aircraft commercial list price. The data collected were analyzed using the Statistical Analysis System (SAS) on the AVSCOM Scientific and Engineering Computer System. The program developed is a linear regression of the form ($y = a + bx$), and the results are shown in the report. GRA

## GENERAL

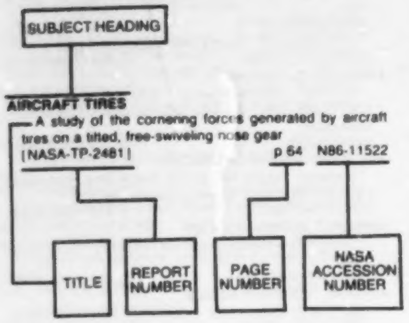
**N86-26276*#** National Aeronautics and Space Administration. Langley Research Center, Hampton, Va.
**LANGLEY AEROSPACE TEST HIGHLIGHTS, 1985**
May 1986 100 p
(NASA-TM-87703; NAS 1.15:87703) Avail: NTIS HC A05/MF A01 CSCL 05A

The role of the Langley Research Center is to perform basic and applied research necessary for the advancement of aeronautics and space flight, to generate new and advanced concepts for the accomplishment of related national goals, and to provide research advice, technological support, and assistance to other NASA installations, other government agencies, and industry. Significant tests which were performed during calendar year 1985 in Langley test facilities, are highlighted. Both the broad range of the research and technology activities at the Langley Research Center and the contributions of this work toward maintaining United States leadership in aeronautics and space research, are illustrated. Other highlights of Langley research and technology for 1985 are described in Research and Technology-1985 Annual Report of the Langley Research Center. Author

# SUBJECT INDEX

**AERONAUTICAL ENGINEERING** / *A Continuing Bibliography (Supplement 204)* SEPTEMBER 1986

### Typical Subject Index Listing



SUBJECT HEADING
AIRCRAFT TIRES
A study of the cornering forces generated by aircraft tires on a tilted, free-swiveling nose gear
[NASA-TP-2481] p 64 N86-11522
TITLE
REPORT NUMBER
PAGE NUMBER
NASA ACCESSION NUMBER

The subject heading is a key to the subject content of the document. The title is used to provide a description of the subject matter. When the title is insufficiently descriptive of the document content, the title extension is added, separated from the title by three hyphens. The (NASA or AIAA) accession number and the page number are included in each entry to assist the user in locating the abstract in the abstract section. If applicable, a report number is also included as an aid in identifying the document. Under any one subject heading, the accession numbers are arranged in sequence with the AIAA accession numbers appearing first.

## A

**A-310 AIRCRAFT**
A comparison of solutions of the complete potential equation and the Euler equations for the transonic flow around the DFVLR-F4-wing
[DGLR PAPER 85-121] p 475 A86-35171

**A-320 AIRCRAFT**
Details on the optimization of cruising drag of the Airbus A320
[DGLR PAPER 85-089] p 487 A86-35152
Front seat on the future --- in airbus 320
p 509 A86-35563

**ABSORPTION**
An internal variable assisted formulation of moisture sorption models for polymers and composites
p 515 A86-34650

**ACCESS CONTROL**
LQG/LTR design of a robust flight controller for the STOL F-15
[AD-A164111] p 512 N86-24708

**ACCIDENT PREVENTION**
DFW (Dallas-Ft. Worth) microburst on August 2, 1985
[NASA-CR-176794] p 529 N86-25956

**ACCURACY**
Increments in aerofoil maximum lift coefficient due to deployment of various high-lift devices
[ESDU-85033] p 480 N86-25325

**ACOUSTIC EMISSION**
Assessment of structural damage in composites utilizing acoustic emission technology p 521 A86-35651

**ACOUSTIC MEASUREMENT**
The development and calibration of an acoustic wall transonic test section
[AIAA PAPER 86-0759] p 514 A86-37090

**ACOUSTIC PROPAGATION**
Weakly nonlinear acoustic and shock-wave theory of the noise of advanced high-speed turbopropellers
p 534 A86-35146

**ACTIVE CONTROL**
Helicopter gust alleviation, attitude stabilization, and vibration alleviation using individual-blade-control through a conventional swash plate p 510 A86-35604
A research program in active control/aeroelasticity
[NASA-CR-176773] p 511 N86-24702
Role of optimization methods in improvement of flight control for airplanes p 513 N86-25603

**ADA (PROGRAMMING LANGUAGE)**
Ada for Simulators
[SAE PAPER 851984] p 532 A86-36945
Using Ada in the real-time avionics environment Issues and conclusions
[AD-A163844] p 533 N86-25151

**ADAPTIVE CONTROL**
Adaptive flutter suppression in the presence of turbulence p 508 A86-35370
Adaptive fuel control testing p 502 A86-35615
Application of closed-loop machining in the manufacture of gas turbines p 521 A86-35659
Adaptive control robustness in flexible aircraft application p 511 A86-37070
An application of adaptive learning to malfunction recovery
[NASA-CR-166620] p 533 N86-25169

**ADIABATIC CONDITIONS**
Experimental study of the supersonic turbulent boundary layer on a blunted axisymmetric body
[AD-A163736] p 479 N86-24669

**AERIAL RECONNAISSANCE**
Developmental sciences prepares Skyeye for Army competition p 495 A86-36819
Army completing development tests for Lockheed Aquila RPV system p 495 A86-36820
U. S. Army plans to evaluate Canadair CL-227 sentinel
p 495 A86-36821
Northrop delivers RPVs to Navy to aid in development proposal p 496 A86-36822

**AEROACOUSTICS**
Measurements regarding the emission angle dependence of propeller-acoustic pressure/time signals, taking into account passing flight conditions
[DGLR PAPER 85-112] p 534 A86-35165
The role of scale models in the design of 'low BVI noise' rotorcraft p 534 A86-35617
A comparative study of tail rotor noise mechanisms
p 534 A86-35618
Model helicopter blade slap at low tip speeds - Theoretical and experimental correlations
p 535 A86-35621
Flow field and near and far sound field of a subsonic jet p 476 A86-35855
Aircraft Noise Prediction Program theoretical manual: Propeller aerodynamics and noise
[NASA-TM-83199-PT-3] p 536 N86-25220
The development and calibration of an acoustic wall transonic test section
[AIAA PAPER 86-0759] p 514 A86-37090
Rotor performance characteristics from an aeroacoustic helicopter wind-tunnel test program
[NASA-TM-87661] p 479 N86-24665
Evaluation of propfan propulsion applied to general aviation
[NASA-CR-175020] p 503 N86-24695
Evaluating turbine engine operating characteristics
[FAA-AC-25.939-1] p 504 N86-24696
Lateral and longitudinal aerodynamic stability and control parameters of the basic vortex flap research aircraft as determined from flight test data
[NASA-TM-87711] p 512 N86-24703
Unsteady heat transfer and direct comparison to steady-state measurements in a rotor-wake experiment
[NASA-TM-87220] p 524 N86-24934
Flow around delta wings with broken-line leading edges p 481 N86-25560
Information on new AN-124 giant cargo plane
p 498 N86-25601
Role of optimization methods in improvement of flight control for airplanes p 513 N86-25603

**AERODYNAMIC BALANCE**
The effect of the admissible centering misalignment of a transport aircraft on its mass p 495 A86-35981

**AERODYNAMIC CHARACTERISTICS**
Rising of the Ferrie point on the windward side of delta wings p 474 A86-34485
A vortex lattice method for calculating nonlinear aerodynamic characteristics of interfering airfoils
[DGLR PAPER 85-122] p 475 A86-35172
Estimation of transport airplane aerodynamics using multiple stepwise regression p 489 A86-35385
Calculation of the dynamic response of a flight vehicle using a discrete-continuous model p 476 A86-35979
Classification of flight vehicles according to the type of propulsion - Determination of the type and number of lift solutions p 473 A86-35983
Calculation of the aerodynamic characteristics of three-dimensional wings of finite span in a potential incompressible flow p 476 A86-35985
Group studies of equations of the laminar boundary layer on a rotating wing p 476 A86-35994
The method of fundamental solutions in aerodynamics. II Applications to the theory of lifting surfaces in supersonic flow p 477 A86-36285
Nonlinear lift control at high speed and high angle of attack using vortex flow technology p 478 A86-37050

**AERODYNAMIC COEFFICIENTS**
Analytic representation of steady and unsteady aerodynamic coefficients of modern helicopter rotors
[DGLR PAPER 85-114] p 474 A86-35167
Experimental assessment of vortex retaining cavity flaps for maneuverability improvement on delta wing fighter aircraft
[AD-A164104] p 497 N86-24690
Increments in aerofoil maximum lift coefficient due to deployment of various high-lift devices
[ESDU-85033] p 480 N86-25325

**AERODYNAMIC CONFIGURATIONS**
Roll-damping measurements on two flight body configurations in the Goettingen DFVLR-AVA transonic wind tunnel
[DGLR PAPER 85-090] p 508 A86-35153
Configuration aspects of modern high-performance aircraft
[DGLR PAPER 85-130] p 488 A86-35176
Analytical tools for systematic transonic design
p 477 A86-36201
Study of the effects of discretizing quantitative feedback theory analog control system designs
[AD-A164209] p 533 N86-25174
Flutter analysis of low aspect ratio wings
p 527 N86-25838
Langley aerospace test highlights, 1985
[NASA-TM-87703] p 537 N86-26276

**AERODYNAMIC DRAG**
Details on the optimization of cruising drag of the Airbus A320
[DGLR PAPER 85-089] p 487 A86-35152
The behaviour and performance of leading edge vortex flaps
[CAR-8601] p 479 N86-24666
In-flight measurements of wing ice shapes and wing section drag increases caused by natural icing conditions
[NASA-TM-87301] p 479 N86-24667

**AERODYNAMIC FORCES**
Loads and motions of an F-106B flying through thunderstorms
[NASA-TM-87671] p 483 N86-24672

**AERODYNAMIC INTERFERENCE**
Simulation and measurement of engine influences in a two-jet aircraft model using model engines
[DGLR PAPER 85-092] p 513 A86-35155
Unsteady transonic flow calculations for wing-fuselage configurations
[NASA-TM-87707] p 478 N86-24657

**AERODYNAMIC LOADS**
Hovering rotor airload prediction using a full potential flow analysis with realistic wake geometry
p 475 A86-35636
Loads and motions of an F-106B flying through thunderstorms
[NASA-TM-87671] p 483 N86-24672

**AERODYNAMIC NOISE**
Weakly nonlinear acoustic and shock-wave theory of the noise of advanced high-speed turbopropellers p 534 A86-35146

**AERODYNAMIC STABILITY**
Bifurcation techniques for nonlinear dynamic analysis of compressor stall phenomena p 501 A86-35403
Correlation of stability test results and analysis for the 1/5 scale V-22 aeroelastic model p 490 A86-35603
Flutter analysis of low aspect ratio wings p 527 N86-25838

**AERODYNAMIC STALLING**
Bifurcation techniques for nonlinear dynamic analysis of compressor stall phenomena p 501 A86-35403
The importance of dynamic stall in aerodynamic modeling of the Darrieus rotor p 528 A86-36448
Increments in aerofoil maximum lift coefficient due to deployment of various high-lift devices [ESDU-85033] p 480 N86-25325
Pitch-location effects on dynamic stall [AD-A164322] p 480 N86-25329

**AERODYNAMICS**
The induced downwash and lift on a wing of high aspect ratio in unsteady motion p 474 A86-34160
Application of elliptic continuation method for transonic aerofoil design and experimental verification p 477 A86-36206

**AEROELASTICITY**
Correlation of stability test results and analysis for the 1/5 scale V-22 aeroelastic model p 490 A86-35603
Effects of analytical modeling assumptions on the predicted stability of a model hingeless rotor p 490 A86-35605
Unsteady transonic flow calculations for wing-fuselage configurations [NASA-TM-87707] p 478 N86-24657

Evaluating turbine engine operating characteristics
[FAA-AC-25.939-1] p 504 N86-24696
Damage Tolerance Concepts for Critical Engine Components
[AGARD-CP-393] p 506 N86-25360
TURBISTAN: A standard load sequence for aircraft engine discs p 526 N86-25380

**AIRCRAFT EQUIPMENT**
Frameless transparencies for aircraft cockpit enclosures
[AD-D012155] p 497 N86-24689
A review of the pilot backache problem in the CH113 Labrador helicopter
[AD-A164011] p 530 N86-25113

**AIRCRAFT FUEL SYSTEMS**
Digital correction of the readings of an aircraft fuel-measurement system p 500 A86-36725

**AIRCRAFT FUELS**
Emission FTIR analyses of thin microscopic patches of jet fuel residues deposited on heated metal surfaces
[NASA-CR-176786] p 519 N86-25502

**AIRCRAFT GUIDANCE**
Guidance, navigation, and control for 21st century aircraft p 508 A86-34194
A preliminary study of the basic display/guidance requirements for flying near optimal trajectories
p 499 A86-35366
Simulation of time-control procedures for terminal area flow management p 484 A86-35369
Guidance studies for curved, descending approaches using the Microwave Landing System (MLS)
[NASA-CR-178030] p 486 N86-25335

**AIRCRAFT HYDRAULIC SYSTEMS**
Evolving 8000 psi hydraulic systems
p 487 A86-34196

**AIRCRAFT INSTRUMENTS**
Studies on turning errors of the magnetic compass in flight experiments p 499 A86-34276

**AIRCRAFT LANDING**
New developments in antennas of classical radio navigational and landing sytems p 484 A86-33741
Multivariable output control law design for the STOL (Short Takeoff and Landing) F-15 in landing configuration
[AD-A164516] p 498 N86-25340
Simulation problem of controlling lateral movement of aircraft during landing approach p 534 N86-26180

**AIRCRAFT LIGHTS**
Aircraft lighting systems p 491 A86-35607

**AIRCRAFT MAINTENANCE**
Simulation of aircraft components for training purposes
[SAE PAPER 851965] p 496 A86-36946
Automating knowledge acquisition in a flightline robot
[AD-A163829] p 525 N86-24997

**AIRCRAFT MANEUVERS**
On the vertical turns sustaining corner velocity --- optimal control in aircraft minimum time pull-ups from dives
p 507 A86-33979
Estimation of transport airplane aerodynamics using multiple stepwise regression p 489 A86-35385
Helicopter handling requirements based on analysis of flight maneuvers p 510 A86-35625
AV-8B High Angle of Attack/departure resistance system flight test program
[AIAA PAPER 86-9729] p 496 A86-37082
Use of state estimation to calculate angle-of-attack position error from flight test data
[AD-A163962] p 480 N86-24670
Lateral and longitudinal aerodynamic stability and control parameters of the basic vortex flap research aircraft as determined from flight test data
[NASA-TM-87711] p 512 N86-24703
Multivariable control law design for enhanced air combat maneuvering. F-15/STOL (Short Take-Off and Landing) derivative fighter
[AD-A164017] p 512 N86-24706

**AIRCRAFT MODELS**
Correlation of stability test results and analysis for the 1/5 scale V-22 aeroelastic model p 490 A86-35603
Effects of analytical modeling assumptions on the predicted stability of a model hingeless rotor
p 490 A86-35605
A study of a collision avoidance system mounted on a curved ground plane
[NASA-CR-176771] p 485 N86-24677
Multivariable control law design for enhanced air combat maneuvering. F-15/STOL (Short Take-Off and Landing) derivative fighter
[AD-A164017] p 512 N86-24706

**AIRCRAFT NOISE**
757 Major Static Test instrumentation systems
p 520 A86-34636
The role of scale models in the design of 'low BVI noise' rotorcraft p 534 A86-35617
A comparative study of tail rotor noise mechanisms
p 534 A86-35618
FAA/HAI helicopter flight operations noise tests and initial results p 535 A86-35619
Rotor performance characteristics from an aeroacoustic helicopter wind-tunnel test program
[NASA-TM-87661] p 479 N86-24665
An estimate of the enroute noise of an advanced turboprop airplane NASA-TM-87302 E-3020 NAS 1.15:87302 HC A02/MF A01
[NASA-TM-87302] p 535 N86-25217
An experimental investigation of reducing advanced turboprop cabin noise by wing shielding
[NASA-TM-87112] p 536 N86-25218
Aircraft Noise Prediction Program theoretical manual: Propeller aerodynamics and noise
[NASA-TM-83199-PT-3] p 536 N86-25220

**AIRCRAFT PARTS**
Preliminary estimate of fatigue life for dynamic components of a new helicopter p 493 A86-35639
Spare parts pricing - Impact on logistics support
p 537 A86-35647
Using the perturbation method for determining the die forging parameters for aircraft parts p 522 A86-35997
Simulation of aircraft seat response to a crash environment p 530 A86-36879
On the methodology of an interactive computer-aided optimal design of a dual-valve linkage
p 523 A86-36887
Simulation of aircraft components for training purposes
[SAE PAPER 851965] p 496 A86-36946
Structural certification and in-service flight experience of the RB 211-524 fan cowl doors utilising carbon fibre composite materials p 496 A86-37108

**AIRCRAFT PERFORMANCE**
Configuration aspects of modern high-performance aircraft
[DGLR PAPER 85-130] p 488 A86-35176
Cockpit automation - Design and implementation issues
[SAE PAPER 851921] p 529 A86-35431
Pilot vehicle interfaces with smart avionics systems
[SAE PAPER 851923] p 529 A86-35432
Tiltrotor - 'Copter and plane in one
p 490 A86-35565
The performance characteristics of simulated ice on rotorcraft airfoils p 482 A86-35656

Sukhoi frogfoot p 495 A86-36333

Pacific aerosystems continues development of Heron 26 vehicle p 495 A86-36818

Airstart performance of a digital electronic engine control system on an F100 engine
[PAPER-8] p 505 N86-25350

**AIRCRAFT PILOTS**

Twin-engine transport extended range operations
[SAE PAPER 851960] p 482 A86-35456

**AIRCRAFT POWER SUPPLIES**

Application of digital/electric systems to advanced technology aircraft
[SAWE PAPER 1639] p 488 A86-35203

**AIRCRAFT PRODUCTION**

From wind tunnel to large aircraft
[DGLR PAPER 85-086] p 487 A86-35151

Robotics in aircraft manufacturing p 522 A86-35860

**AIRCRAFT RELIABILITY**

Extended range operation of twin-engine commercial airplanes
[SAE PAPER 851959] p 490 A86-35455

The health and usage monitoring of helicopter systems - The next generation p 491 A86-35613

Evaluating turbine engine operating characteristics
[FAA-AC-25.939-1] p 504 N86-24696

**AIRCRAFT SAFETY**

Cockpit and cabin crew coordination and communication
[SAE PAPER 851918] p 473 A86-35448

Cockpit communication and aircraft safety - An empirical study
[SAE PAPER 851858] p 482 A86-35451

Extended range operation of twin-engine commercial airplanes
[SAE PAPER 851959] p 490 A86-35455

The design of the EH101 for safety and performance p 491 A86-35629

Ice detector
[NASA-CASE-LAR-13403-1] p 483 N86-24673

KRASH dynamics analysis modeling: Transport airplane controlled impact demonstration test
[DOT/FAA/CT-85/9-REV] p 483 N86-25331

**AIRCRAFT STABILITY**

Adaptive flutter suppression in the presence of turbulence p 508 A86-35370

Preliminary design of low authority SAS. I -- stability augmentation system p 510 A86-36772

**AIRCRAFT STRUCTURES**

Photogrammetry as a means of mapping postbuckled composite surfaces p 520 A86-34639

The effect of center delamination on the instability of composite cylindrical panels p 520 A86-34642

An internal variable assisted formulation of moisture sorption models for polymers and composites p 515 A86-34650

Straining for weight savings in advanced composites
[SAWE PAPER 1685] p 516 A86-35226

The Hughes integrated approach to helicopter crashworthiness Past, present, and future p 494 A86-35663

A reliability concept in structural optimization of flight vehicles p 494 A86-35677

Some aspects of variability in fatigue crack initiation and propagation in thick aluminium alloy sections p 522 A86-36176

Structural materials in aeronautics - Prospects and perspectives p 516 A86-36335

What is the choice for primary aircraft structures - Composite or aluminum materials? p 516 A86-36750

Drop testing and analysis of six-foot diameter graphite-epoxy frames p 517 A86-37066

Ice detector
[NASA-CASE-LAR-13403-1] p 483 N86-24673

Application of artificial intelligence to improve aircraft survivability
[AD-A164172] p 483 N86-24674

Evaluation of capillary reinforced composites
[NASA-CR-175061] p 517 N86-24760

**AIRCRAFT SURVIVABILITY**

Application of artificial intelligence to improve aircraft survivability
[AD-A164172] p 483 N86-24674

**AIRCRAFT TIRES**

The optimal take-off run of an aircraft on an unpaved surface p 494 A86-35978

**AIRFOIL PROFILES**

Velocity distribution around a wing in a wind tunnel Verification of a calculation method by means of a laser anemometer p 476 A86-35925

Application of elliptic continuation method for transonic aerofoil design and experimental verification p 477 A86-36206

**AIRFOILS**

A vortex lattice method for calculating nonlinear aerodynamic characteristics of interfering airfoils
[DGLR PAPER 85-122] p 475 A86-35172

Inverse method with geometric constraints for transonic aerofoil design p 477 A86-36202

ALESEP. Part 2: A computer program for the analysis of leading edge separation bubbles on infinite swept wings
[NASA-CR-178015] p 479 N86-24664

In-flight measurements of wing ice shapes and wing section drag increases caused by natural icing conditions
[NASA-TM-87301] p 479 N86-24667

An experimental investigation on location of boundary layer transition on the NACA 0012 using surface hot film gages
[NASA-TM-88265] p 524 N86-24936

Life prediction and constitutive models for engine hot section anisotropic materials program
[NASA-CR-174952] p 526 N86-25003

Increments in aerofoil maximum lift coefficient due to deployment of various high-lift devices
[ESDU-85033] p 480 N86-25325

Transonic airfoil analysis and design in nonuniform flow
[NASA-CR-3991] p 480 N86-25328

Pitch-location effects on dynamic stall
[AD-A164322] p 480 N86-25329

Helicopter tail rotor noise analyses
[NASA-CR-176829] p 536 N86-26163

**AIRFRAME MATERIALS**

Postbuckling and crippling behavior of graphite/epoxy thin-walled airframe members p 521 A86-35643

**AIRFRAMES**

An airframer's view of an electric fighter
[SAWE PAPER 1662] p 488 A86-35206

Frameless transparencies for aircraft cockpit enclosures
[AD-D012155] p 497 N86-24689

Constant-Load-Amplitude fatigue crack growth testing of cast aluminum alloys A201-T7 and A357-T6
[AD-A163494] p 518 N86-24821

**AIRLINE OPERATIONS**

Extended range operation of twin-engine commercial airplanes
[SAE PAPER 851959] p 490 A86-35455

**AIRPORTS**

Computed centerline MLS (Microwave Landing System) approach demonstration at Washington National Airport
[AD-A163722] p 486 N86-24681

Materials for emergency repair of runways
[AD-A164225] p 514 N86-25385

AFOS (Automation of Field Operations and Services) terminal forecast decoding
[PB86-147360] p 529 N86-25954

DFW (Dallas-Ft. Worth) microburst on August 2, 1985
[NASA-CR-176794] p 529 N86-25956

**AIRSPACE**

Pressure based separation in the upper airspace
[CAR-8614] p 486 N86-24679

**AIRSPEED**

Conversion of air-data system pressure errors into height and speed corrections
[ESDU-85036] p 497 N86-25336

**ALGORITHMS**

The evaluation of the OSGLR algorithm for restructurable controls
[NASA-CR-178083] p 485 N86-24678

A real-time simulation evaluation of an advanced detection, isolation and accommodation algorithm for sensor failures in turbine engines
[NASA-TM-87289] p 504 N86-24697

Eigenstructure assignment and its application in design of flight control systems
[NASA-TM-88411] p 511 N86-24701

Real-time in-flight thrust calculation on a digital electronic engine control-equipped F100 engine in an F-15 airplane
[PAPER-13] p 506 N86-25355

Parametric optimization of algorithm for estimating values of one class of unsteady random processes p 534 N86-26161

**ALTIMETERS**

Pressure based separation in the upper airspace
[CAR-8614] p 486 N86-24679

**ALTITUDE**

Altitude ignition/lean decel study
[AD-A163052] p 518 N86-24781

**ALUMINUM ALLOYS**

Comparison of Al alloys and carbon fiber composite materials in aircraft construction
[DGLR PAPER 85-136] p 515 A86-35179

Impact of advanced materials on aircraft design weights - The weight improvement factor
[SAWE PAPER 1636] p 488 A86-35202

A weight method for structual boxes
[SAWE PAPER 1680] p 521 A86-35221

Some characteristics of structure formation in forged semifinished products of V93pch aluminum alloy p 522 A86-35869

Some aspects of variability in fatigue crack initiation and propagation in thick aluminium alloy sections p 522 A86-36176

Comparison of the strength and damage tolerance of aluminium alloys p 516 A86-36178

What is the choice for primary aircraft structures - Composite or aluminum materials? p 516 A86-36750

Constant-Load-Amplitude fatigue crack growth testing of cast aluminum alloys A201-T7 and A357-T6
[AD-A163494] p 518 N86-24821

**ANGLE OF ATTACK**

The optimal take-off run of an aircraft on an unpaved surface p 494 A86-35978

AV-8B High Angle of Attack/departure resistance system flight test program
[AIAA PAPER 86-9729] p 495 A86-37062

A numerical analysis applied to high angle of attack three-dimensional inlets
[NASA-TM-87298] p 478 N86-24658

Experimental study of the supersonic turbulent boundary layer on a blunted axisymmetric body
[AD-A163736] p 479 N86-24669

Use of state estimation to calculate angle-of-attack position error from flight test data
[AD-A163962] p 480 N86-24670

Experimental assessment of vortex retaining cavity flaps for maneuverability improvement on delta wing fighter aircraft
[AD-A164104] p 497 N86-24690

Pitch-location effects on dynamic stall
[AD-A164322] p 480 N86-25329

Hypersonic flow around a wing at large angles of attack with detached compression jump p 480 N86-25534

Normal force characteristics of sharp nosed bodies of revolution at high angles of attack in subsonic and transonic flow p 527 N86-25555

**ANGULAR VELOCITY**

Pitch-location effects on dynamic stall
[AD-A164322] p 480 N86-25329

**ANTONOV AIRCRAFT**

Information on new AN-124 giant cargo plane p 498 N86-25601

**APPROACH**

Computed centerline MLS (Microwave Landing System) approach demonstration at Washington National Airport
[AD-A163722] p 486 N86-24681

**APPROACH CONTROL**

Guidance studies for curved, descending approaches using the Microwave Landing System (MLS)
[NASA-CR-178090] p 486 N86-25335

**ARCHITECTURE (COMPUTERS)**

High-speed, automatic controller design considerations for integrating array processor, multi-microprocessor, and host computer system architectures p 531 A86-35409

The possibility of achieving high productivity with vector-pipeline processors in solving problems of mathematical physics p 531 A86-36574

Techniques for increasing the update rate of real-time dynamic computer graphic displays p 523 A86-37072

Control technology for future aircraft propulsion systems
[PAPER-14] p 506 N86-25356

**AREA NAVIGATION**

Time navigation benefits in en route metered ATC p 482 A86-35366

**ARTIFICIAL INTELLIGENCE**

Application of artificial intelligence to improve aircraft survivability
[AD-A164172] p 483 N86-24674

An application of adaptive learning to malfunction recovery
[NASA-CR-166620] p 533 N86-25109

**ASBESTOS**

Aramid fiber composites for general engineering p 517 A86-37137

**ASCENT PROPULSION SYSTEMS**

Control technology for future aircraft propulsion systems
[PAPER-14] p 506 N86-25356

**ASYMMETRY**

Experimental assessment of vortex retaining cavity flaps for maneuverability improvement on delta wing fighter aircraft
[AD-A164104] p 497 N86-24690

**ASYMPTOTIC METHODS**

Time domain control design for robust stability of linear regulators - Application to aircraft control p 508 A86-35383

The effect of random forces on nonlinear oscillating systems p 535 A86-36710

**ATMOSPHERIC BOUNDARY LAYER**

An intercomparison of turbulence data obtained by two aircraft during KonTur p 528 A86-36308

**ATMOSPHERIC MODELS**

Probabilistic modeling of fields of atmospheric turbulence and sea roughness with reference to the study of complex systems --- for flight control p 526 A86-36480

**ATMOSPHERIC PRESSURE**

Pressure based separation in the upper airspace [CAR-8614] p 486 N86-24670

**ATMOSPHERIC TURBULENCE**

Fatigue life in a coupled problem concerning the motion of a flexible wing p 474 A86-35062

An intercomparison of turbulence data obtained by two aircraft during KonTur p 528 A86-36308

Probabilistic modeling of fields of atmospheric turbulence and sea roughness with reference to the study of complex systems --- for flight control p 526 A86-36480

Helicopter rotor noise due to ingestion of atmospheric turbulence [NASA-CR-3973] p 535 N86-25216

DFW (Dallas-Ft. Worth) microburst on August 2, 1985 [NASA-CR-178794] p 529 N86-25956

**ATTITUDE CONTROL**

Multivariable output control law design for the STOL (Short Takeoff and Landing) F-15 in landing configuration [AD-A164516] p 498 N86-25340

**ATTITUDE STABILITY**

Helicopter gust alleviation, attitude stabilization, and vibration alleviation using individual-blade-control through a conventional swash plate p 510 A86-35604

**AUGMENTATION**

Augmentor transient capability of an F100 engine equipped with a digital electronic engine control [PAPER-11] p 505 N86-25353

**AUTOMATED EN ROUTE ATC**

Time navigation benefits in en route metered ATC p 482 A86-35386

**AUTOMATED PILOT ADVISORY SYSTEM**

Stored terrain data base aided pilotage for helicopters p 499 A86-35606

**AUTOMATIC CONTROL**

Cockpit automation technology - A further look p 499 A86-33814

Design of the CL-227 air vehicle p 487 A86-34924

1985 American Control Conference, 4th, Boston, MA, June 19-21, 1985, Proceedings. Volumes 1, 2, & 3 p 531 A86-35326

Cockpit automation - Design and implementation issues [SAE PAPER 851921] p 529 A86-35431

**AUTOMATIC FLIGHT CONTROL**

Flying hands off to a hover --- automatic flight control in helicopters p 507 A86-34193

SR-71 digital automatic flight and inlet control system [SAE PAPER 851977] p 509 A86-35457

**AUTOMATIC PILOTS**

Coordinated bank-to-turn autopilot design p 509 A86-35384

A computer controlled autopilot and an annunciation system for light aircraft p 511 A86-36871

**AUTOMATIC TEST EQUIPMENT**

A completely integrated system for the treatment of crack growth test data p 531 A86-34635

**AUTOMATION**

Robotics in aircraft manufacturing p 522 A86-35660

**AUTOMOBILES**

Advanced composites - The structural revolution p 517 A86-37136

**AVERAGE**

Propulsion and Energetics Panel Working Group 14 on suitable averaging techniques in non-uniform internal flows [AD-A133968] p 503 N86-24692

**AVIATION PSYCHOLOGY**

Faulty cockpit communication as a factor in the failure of flight 90 [SAE PAPER 851859] p 482 A86-35452

**AVIONICS**

Weight assessment of electronic boxes --- for aircraft design [SAWE PAPER 1661] p 499 A86-35207

Pilot vehicle interfaces with smart avionics systems [SAE PAPER 851923] p 529 A86-35432

American Helicopter Society, Annual Forum, 41st, Fort Worth, TX, May 15-17, 1985, Proceedings p 473 A86-35601

An avionics software test and evaluation technique p 499 A86-35650

Integrated avionics suite as implemented on the Agusta A-129 p 500 A86-35666

A computer controlled autopilot and an annunciation system for light aircraft p 511 A86-36871

An engineering approach to the use of expert systems technology in avionics applications [NASA-TM-88263] p 497 N86-24687

Using Ada in the real-time avionics environment issues and conclusions [AD-A163844] p 533 N86-25151

Cost estimating relationships for fixed wing aircraft: List price versus empty weight [AD-A164198] p 537 N86-25300

AN-124 airplane's cargo-handling and automation equipment p 527 N86-25600

Development and evaluation of math library routines for a 1750A airborne microcomputer [AD-A164050] p 533 N86-26030

Langley aerospace test highlights, 1985 [NASA-TM-87703] p 537 N86-26276

**AXIAL FLOW**

The superposition distortion index --- in axial flow fans of turbofan engines p 500 A86-34279

Laser beam duct pressure controller system [AD-D012017] p 525 N86-24984

Dynamic and aeroelastic analyses of turbosystems in NASTRAN p 527 N86-25826

**AXISYMMETRIC BODIES**

Experimental study of the supersonic turbulent boundary layer on a blunted axisymmetric body [AD-A163736] p 479 N86-24669

**AZIMUTH**

Computed centerline MLS (Microwave Landing System) approach demonstration at Washington National Airport [AD-A163722] p 486 N86-24681

## B

**BALL BEARINGS**

Review and critical analysis: Rolling-element bearings for system life and reliability [NASA-CR-174710] p 525 N86-24991

**BEARINGS**

Passive eddy-current damping as a means of vibration control in cryogenic turbomachinery [NASA-TP-2562] p 515 N86-24722

**BELL AIRCRAFT**

Flight investigation of Bell model 206 ring fin p 491 A86-35624

A comparative study of an articulated integrated side-arm controller in a variable stability helicopter p 510 A86-35626

**BENDING MOMENTS**

An optimization procedure for a redundant wing structure [SAWE PAPER 1684] p 521 A86-35225

**BIODYNAMICS**

The use of ellipsoidal solids to display human body dynamic response p 530 A86-36852

**BIOLOGICAL MODELS (MATHEMATICS)**

The use of ellipsoidal solids to display human body dynamic response p 530 A86-36852

**BLADE TIPS**

Model helicopter blade slap at low tip speeds - Theoretical and experimental correlations p 535 A86-35621

Free-tip-rotor wind-tunnel test results p 491 A86-35628

One-piece HPTR blade squealer tip [AD-D012003] p 504 N86-24698

**BLOWOUTS**

Altitude ignition/lean decel study [AD-A163052] p 518 N86-24781

**BLUNT BODIES**

Experimental study of the supersonic turbulent boundary layer on a blunted axisymmetric body [AD-A163736] p 479 N86-24669

Supersonic flow around blunt perforated shields p 480 N86-25558

**BO-105 HELICOPTER**

Development of the BO 105 LS p 487 A86-34920

**BODY-WING CONFIGURATIONS**

Unsteady transonic flow calculations for wing-fuselage configurations [NASA-TM-87707] p 478 N86-24657

Experimental study of apex fences for lift enhancement on a highly swept delta wing configuration [AD-A163877] p 512 N86-24705

**BOEING 757 AIRCRAFT**

757 Major Static Test instrumentation systems p 520 A86-34636

**BOUNDARY ELEMENT METHOD**

Advanced topics in boundary element analysis; Proceedings of the Winter Annual Meeting, Miami Beach, FL, November 17-22, 1985 p 520 A86-34442

Stress analysis of gas turbine engine structures using the boundary element method p 520 A86-34444

**BOUNDARY LAYER EQUATIONS**

Group studies of equations of the laminar boundary layer on a rotating wing p 476 A86-35994

**BOUNDARY LAYER SEPARATION**

Experimental study of the supersonic turbulent boundary layer on a blunted axisymmetric body [AD-A163736] p 479 N86-24669

**BOUNDARY LAYER TRANSITION**

Advanced boundary layer transition measurement methods for flight applications [AIAA PAPER 86-9786] p 500 A86-37083

An experimental investigation on location of boundary layer transition on the NACA 0012 using surface hot film gages [NASA-TM-88285] p 524 N86-24936

**BOUNDARY LAYERS**

Natural laminar flow flight experiments on a swept wing business jet-boundary layer stability analyses [NASA-CR-3975] p 478 N86-24659

**BOUNDARY VALUE PROBLEMS**

Comparison of absorption and radiation boundary conditions using a time-domain three-dimensional finite difference electromagnetic computer code [AD-A163826] p 532 N86-25149

Movement of flexible wing at supersonic velocity under influence of random gust p 481 N86-25562

**BRACKETS**

Process development and test evaluation of cast, HIP and heat treated titanium UH-60A M.R. Damper Bracket p 516 A86-35641

**BRAKES (FOR ARRESTING MOTION)**

Fireproof hydraulic brake system [AD-A163542] p 497 N86-24686

**BRANCHING (MATHEMATICS)**

Bifurcation techniques for nonlinear dynamic analysis of compressor stall phenomena p 501 A86-35403

**BUBBLES**

ALESEP. Part 2: A computer program for the analysis of leading edge separation bubbles on infinite swept wings [NASA-CR-178015] p 479 N86-24664

**BUCKLING**

Photogrammetry as a means of mapping postbuckled composite surfaces p 520 A86-34639

Postbuckling and crippling behavior of graphite/epoxy thin-walled airframe members p 521 A86-35643

Postbuckling failure of composite panels p 523 A86-37112

## C

**CANARD CONFIGURATIONS**

Multivariable control law design for enhanced air combat maneuvering F-15/STOL (Short Take-Off and Landing) derivative fighter [AD-A164017] p 512 N86-24706

**CAPACITORS**

Ice detector [NASA-CASE-LAR-13403-1] p 483 N86-24673

**CAPILLARY FLOW**

Evaluation of capillary reinforced composites [NASA-CR-175061] p 517 N86-24760

**CARBON FIBER REINFORCED PLASTICS**

Comparison of Al alloys and carbon fiber composite materials in aircraft construction [DGLR PAPER 85-136] p 515 A86-35179

The material development, component manufacture and post-service evaluation of RB 211-524 cowl doors utilising carbon fibre composite materials p 523 A86-37106

Structural certification and in-service flight experience of the RB 211-524 fan cowl doors utilising carbon fibre composite materials p 496 A86-37108

Postbuckling failure of composite panels p 523 A86-37112

**CASCADE FLOW**

Intrablade velocity mapping in transonic fan passages of gas turbine p 474 A86-34411

Inverse design of supercritical nozzles and cascades p 477 A86-36207

**CAST ALLOYS**

Advanced structural casting applications for a gas turbine engine p 521 A86-35658

Constant-Load-Amplitude fatigue crack growth testing of cast aluminum alloys A201-T7 and A357-T6 [AD-A163494] p 518 N86-24821

**CASTINGS**

One-piece HPTR blade squealer tip [AD-D012003] p 504 N86-24698

**CASUALTIES**

Aircraft accident report: Air Canada flight 797, McDonnell Douglas DC-9-32, C-FTLU, Greater Cincinnati International Airport, Covington, Kentucky, June 2, 1983 [PB86-910402] p 483 N86-25332

**CATASTROPHE THEORY**

Bifurcation techniques for nonlinear dynamic analysis of compressor stall phenomena p 501 A86-35403

**CAVITIES**
Experimental assessment of vortex retaining cavity flaps for maneuverability improvement on delta wing fighter aircraft
[AD-A164104] p 497 N86-24680
**CENTER OF GRAVITY**
Requirements for second generation aircraft weighing systems
[SAWE PAPER 1669] p 513 A86-35213
**CERTIFICATION**
Structural certification and in-service flight experience of the RB 211-524 fan cowl doors utilising carbon fibre composite materials p 496 A86-37108
**CH-47 HELICOPTER**
Higher harmonic control - Wind tunnel demonstration of fully effective vibratory hub force suppression
p 509 A86-35602
**CHANNEL FLOW**
Velocity distribution around a wing in a wind tunnel Verification of a calculation method by means of a laser anemometer p 476 A86-35925
**CHEMICAL COMPOSITION**
Emission FTIR analyses of thin microscopic patches of jet fuel residues deposited on heated metal surfaces
[NASA-CR-176786] p 519 N86-25502
**CIRCULATION CONTROL AIRFOILS**
Applied aerodynamics of circuation control airfoils and rotors p 475 A86-35634
**CIRCULATION CONTROL ROTORS**
X-wing potential for Navy applications
p 492 A86-35631
Applied aerodynamics of circulation control airfoils and rotors p 475 A86-35634
**CIVIL AVIATION**
United Airlines windshear training update
[SAE PAPER 851920] p 482 A86-35450
Evaluation of propfan propulsion applied to general aviation
[NASA-CR-175020] p 503 N86-24695
**CLASSIFICATIONS**
Classification of flight vehicles according to the type of propulsion - Determination of the type and number of lift solutions p 473 A86-35983
**CLIMBING FLIGHT**
On the vertical turns sustaining corner velocity --- optimal control in aircraft minimum time pull-ups from dives
p 507 A86-33979
**CLOSURES**
One-piece HPTR blade squealer tip
[AD-D012003] p 504 N86-24698
**CLOUD PHYSICS**
An assessment of data quality and quantity from airborne cloud physics projects from 1974 through 1984
[DOT/FAA/CT-85/37] p 528 N86-25079
**CLOUDS (METEOROLOGY)**
An assessment of data quality and quantity from airborne cloud physics projects from 1974 through 1984
[DOT/FAA/CT-85/37] p 528 N86-25079
DFW (Dallas-Ft. Worth) microburst on August 2, 1985
[NASA-CR-176794] p 529 N86-25956
**COCKPIT SIMULATORS**
A preliminary study of the basic display/guidance requirements for flying near optimal trajectories
p 499 A86-35366
**COCKPITS**
Pilot error accidents - A total system approach to analysis p 481 A86-33799
Cockpit automation technology - A further look
p 499 A86-33814
Cockpit automation - Design and implementation issues
[SAE PAPER 851921] p 529 A86-35431
Cockpit and cabin crew coordination and communication
[SAE PAPER 851918] p 473 A86-35448
Cockpit communication and aircraft safety - An empirical study
[SAE PAPER 851858] p 482 A86-35451
Faulty cockpit communication as a factor in the failure of flight 90
[SAE PAPER 851859] p 482 A86-35452
Front seat on the future --- in airbus 320
p 509 A86-35563
The role of flight simulation in helicopter crew station design
[SAE PAPER 851900] p 530 A86-36940
Frameless transparencies for aircraft cockpit enclosures
[AD-D012155] p 497 N86-24689
**COEFFICIENT OF FRICTION**
Fireproof hydraulic brake system
[AD-A163542] p 497 N86-24688
**COLLISION AVOIDANCE**
The consideration of pilot factors in development of future collision avoidance systems
[SAE PAPER 851807] p 484 A86-35437
A study of a collision avoidance system mounted on a curved ground plane
[NASA-CR-176771] p 485 N86-24677
Pilot evaluation of TCAS in the Long Ranger helicopter
[FAA/PM-85/30] p 486 N86-25334
**COMBAT**
Application of helicopter air-to-air combat test (AACT) data to current LHX concerns p 491 A86-35627
**COMBINED STRESS**
A weight method for structual boxes
[SAWE PAPER 1680] p 521 A86-35221
**COMBUSTION**
Data sources for parameters used in predictive modeling of fire growth and smoke spread
[PB86-130986] p 518 N86-24788
**COMBUSTION CHAMBERS**
Altitude ignition/lean decel study
[AD-A163052] p 518 N86-24781
**COMBUSTION CHEMISTRY**
A transport model for flammability of premixed gases
p 516 A86-36874
**COMMERCIAL AIRCRAFT**
An application of self-tuning regulator to GLA system of an aircraft --- Gust Load Alleviation
p 508 A86-34926
Extended range operation of twin-engine commercial airplanes
[SAE PAPER 851959] p 490 A86-35455
Wind tunnel technology for the development of future commercial aircraft
[NASA-TM-88390] p 514 N86-24710
**COMMUNICATING**
Faulty cockpit communication as a factor in the failure of flight 90
[SAE PAPER 851859] p 482 A86-35452
**COMMUNICATION EQUIPMENT**
SHARP (Stationary High Altitude Relay Platforms) Telecommunications missions and systems
p 519 A86-33943
**COMMUNICATION NETWORKS**
AFOS (Automation of Field Operations and Services) terminal forecast decoding
[PB86-147360] p 529 N86-25954
**COMPENSATORS**
Study of the effects of discretizing quantitative feedback theory analog control system designs
[AD-A164209] p 533 N86-25174
**COMPILERS**
Using Ada in the real-time avionics environment issues and conclusions
[AD-A163344] p 533 N86-25151
**COMPOSITE MATERIALS**
An internal variable assisted formulation of moisture sorption models for polymers and composites
p 515 A86-34650
What is the choice for primary aircraft structures - Composite or aluminum materials? p 516 A86-36750
Method to determine the complete three-dimensional elastic compliance matrix of composite materials
p 517 A86-37134
Evaluation of capillary reinforced composites
[NASA-CR-175061] p 517 N86-24760
**COMPOSITE STRUCTURES**
Photogrammetry as a means of mapping postbuckled composite surfaces p 520 A86-34639
The effect of center delamination on the instability of composite cylindrical panels p 520 A86-34642
The impact of accommodating defects on the efficiency of aircraft design
[SAWE PAPER 1635] p 488 A86-35201
Impact of advanced materials on aircraft design weights - The weight improvement factor
[SAWE PAPER 1636] p 488 A86-35202
Straining for weight savings in advanced composites
[SAWE PAPER 1665] p 516 A86-35226
A skin-stringer design for a crashworthy composite fuselage for the Hughes 500E helicopter
p 492 A86-35637
Combining analysis and test for rotor blade development p 493 A86-35648
Development of a composite tail rotor blade for the MH-53E p 493 A86-35649
Assessment of structural damage in composites utilizing acoustic emission technology p 521 A86-35651
Structural certification and in-service flight experience of the RB 211-524 fan cowl doors utilising carbon fibre composite materials p 496 A86-37108
Postbuckling failure of composite panels
p 523 A86-37112
Damage tolerant composite design development
p 524 A86-37119
Advanced composites - The structural revolution
p 517 A86-37136
**COMPRESSIBLE FLOW**
Analytical tools for systematic transonic design
p 477 A86-36201
**COMPRESSIVE STRENGTH**
Compressive strength of impact damaged graphite epoxy laminates p 517 A86-37118
Materials for emergency repair of runways
[AD-A164225] p 514 N86-25385
**COMPRESSOR EFFICIENCY**
Flight evaluation of a hydromechanical backup control for the digital electronic engine control system in an F100 engine
[PAPER-9] p 505 N86-25351
**COMPRESSORS**
Bifurcation techniques for nonlinear dynamic analysis of compressor stall phenomena p 501 A86-35403
**COMPUTATIONAL FLUID DYNAMICS**
A vortex lattice method for calculating nonlinear aerodynamic characteristics of interfering airfoils
[DGLR PAPER 85-122] p 475 A86-35172
Inviscid vortex-stretched turbulent shear-layer flow computed around a cranked delta wing
p 475 A86-35253
Analytical tools for systematic transonic design
p 477 A86-36201
Inverse method with geometric constraints for transonic aerofoil design p 477 A86-36202
The method of fundamental solutions in aerodynamics. II Applications to the theory of lifting surfaces in supersonic flow p 477 A86-36285
The importance of dynamic stall in aerodynamic modeling of the Darrieus rotor p 528 A86-36448
Implicit, vectorizable schemes for the flux-difference split, three-dimensional Navier-Stokes equations
p 523 A86-37067
Unsteady transonic flow calculations for wing-fuselage configurations
[NASA-TM-87707] p 478 N86-24657
A numerical analysis applied to high angle of attack three-dimensional inlets
[NASA-TM-87298] p 478 N86-24658
**COMPUTATIONAL GRIDS**
Advanced topics in boundary element analysis; Proceedings of the Winter Annual Meeting, Miami Beach, FL, November 17-22, 1985 p 520 A86-34442
**COMPUTER AIDED DESIGN**
Applicability of using the CAR-II model in design and evaluation of multioperator workstations with shared controls p 529 A86-33805
Optimization in design processes - An informatics point of view p 531 A86-36208
On the methodology of an interactive computer-aided optimal design of a dual-valve linkage
p 523 A86-36887
Advanced composites - The structural revolution
p 517 A86-37136
Multivariable output control law design for the STOL (Short Takeoff and Landing) F-15 in landing configuration
[AD-A164516] p 498 N86-25340
Generation of spiral bevel gears with zero kinematical errors and computer aided tooth contact analysis
[NASA-TM-87273] p 527 N86-25793
**COMPUTER AIDED MANUFACTURING**
Application of closed-loop machining in the manufacture of gas turbines p 521 A86-35659
**COMPUTER GRAPHICS**
Techniques for increasing the update rate of real-time dynamic computer graphic displays p 523 A86-37072
**COMPUTER PROGRAMMING**
The possibility of achieving high productivity with vector-pipeline processors in solving problems of mathematical physics p 531 A86-36574
**COMPUTER PROGRAMS**
ALESEP. Part 2: A computer program for the analysis of leading edge separation bubbles on infinite swept wings
[NASA-CR-178015] p 479 N86-24664
Data sources for parameters used in predictive modeling of fire growth and smoke spread
[PB86-130986] p 518 N86-24788
Comparison of absorption and radiation boundary conditions using a time-domain three-dimensional finite difference electromagnetic computer code
[AD-A163826] p 532 N86-25149
Transonic airfoil analysis and design in nonuniform flow
[NASA-CR-3991] p 480 N86-25328
KRASH dynamics analysis modeling: Transport airplane controlled impact demonstration test
[DOT/FAA/CT-85/9-REV] p 483 N86-25331
**COMPUTER SYSTEMS PERFORMANCE**
Experiences with NASTRAN in a multidisciplinary optimization environment p 527 N86-25831

**COMPUTER SYSTEMS PROGRAMS**

An empirical study of flight control software reliability
[NASA-CR-178058] p 532 N86-25145

**COMPUTER TECHNIQUES**

Computer-controlled navigation for aeromagnetic survey flights during the GANOVEX IV Antarctic expedition during the southern summer of 1984/85 p 484 A86-35293

Computer-aided cockpit workload analysis for all weather, multirole tactical aircraft
[SAE PAPER 851876] p 499 A86-35439

The application of systolic array processor technology to real-time control p 532 A86-36894

Manufacturing technology for nondestructive evaluation (NDE) system to implement Retirement For Cause (RFC) procedures for gas turbine engine components
p 507 N86-25368

**COMPUTERIZED SIMULATION**

Practical considerations in optimal flight management computations p 481 A86-35367

The use of ellipsoidal solids to display human body dynamic response p 530 A86-36852

Investigation of rolling-up and interaction of leading-edge and trailing-edge vortex sheets on a slender delta wing
[AD-A163692] p 479 N86-24668

A real-time simulation evaluation of an advanced detection, isolation and accommodation algorithm for sensor failures in turbine engines
[NASA-TM-87269] p 504 N86-24697

System life and reliability modeling for helicopter transmissions
[NASA-CR-3967] p 525 N86-24990

Guidance studies for curved, descending approaches using the Microwave Landing System (MLS)
[NASA-CR-178030] p 486 N86-25335

Evaluation of a frequency response technique for aircraft system identification
[AD-A164367] p 497 N86-25339

**COMPUTERS**

Real-time flight test PCM data acquisition monitor
[AD-A164035] p 524 N86-24897

**CONCORDE AIRCRAFT**

Selections from Flug Revue und Flugwelt International. A. On the border of Time-hypersonic flight. B. NASA programs pave the way for the hypersonic aircraft. C. Shuttle flight 61-B; construction in space. D. Faster than a bullet; hypersonic military aircraft
[NASA-TM-88418] p 474 N86-24652

**CONDENSATION**

Vapor-screen flow-visualization experiments in the NASA Langley 0.3-m transonic cryogenic tunnel
[NASA-CR-3984] p 478 N86-24661

**CONFERENCES**

International Symposium on Laser Anemometry, 2nd, Miami Beach, FL, November 17-22, 1985, Proceedings
p 519 A86-34407

Advanced topics in boundary element analysis; Proceedings of the Winter Annual Meeting, Miami Beach, FL, November 17-22, 1985 p 520 A86-34442

1985 American Control Conference, 4th, Boston, MA, June 19-21, 1985, Proceedings. Volumes 1, 2, & 3
p 531 A86-35326

American Helicopter Society, Annual Forum, 41st, Fort Worth, TX, May 15-17, 1985, Proceedings
p 473 A86-35601

Flight simulation/simulators; Proceedings of the Aerospace Technology Conference and Exposition, Long Beach, CA, October 14-17, 1985
[SAE SP-634] p 473 A86-36939

Digital Electronic Engine Control (DEEC) Flight Evaluation in an F-15 Airplane
[NASA-CP-2298] p 504 N86-25342

**CONSTANTS**

Pitch-location effects on dynamic stall
[AD-A164322] p 480 N86-25329

**CONSTRAINTS**

Cost estimating relationships for fixed wing aircraft: List price versus empty weight
[AD-A164196] p 537 N86-25300

**CONTINUUM MECHANICS**

The possibility of achieving high productivity with vector-pipeline processors in solving problems of mathematical physics p 531 A86-36574

**CONTINUUM MODELING**

Calculation of the dynamic response of a flight vehicle using a discrete-continuous model p 476 A86-35979

**CONTRAROTATING PROPELLERS**

Experimental study of the effects of installation on singleand counter-rotation propeller noise
[NASA-TP-2541] p 536 N86-26162

**CONTROL EQUIPMENT**

AN-124 airplane's cargo-handling and automation equipment p 527 N86-25600

**CONTROL SIMULATION**

Simulation of time-control procedures for terminal area flow management p 484 A86-35369

Multivariable control law design for enhanced air combat maneuvering. F-15/STOL (Short Take-Off and Landing) derivative fighter
[AD-A164017] p 512 N86-24706

**CONTROL STICKS**

Helicopter flight control with one hand
p 529 A86-34923

Front seat on the future --- in airbus 320
p 509 A86-35563

A comparative study of an articulated integrated side-arm controller in a variable stability helicopter
p 510 A86-35626

**CONTROL SURFACES**

Experimental assessment of vortex retaining cavity flaps for maneuverability improvement on delta wing fighter aircraft
[AD-A164104] p 497 N86-24690

Multivariable control law design for enhanced air combat maneuvering. F-15/STOL (Short Take-Off and Landing) derivative fighter
[AD-A164017] p 512 N86-24706

Increments in aerofoil maximum lift coefficient due to deployment of various high-lift devices
[ESDU-85033] p 480 N86-25325

**CONTROL SYSTEMS DESIGN**

1985 American Control Conference, 4th, Boston, MA, June 19-21, 1985, Proceedings. Volumes 1, 2, & 3
p 531 A86-35326

Gain-scheduled multivariable cotnrol for the GE-21 turbofan engine using the LQG/LTR methodology
p 501 A86-35334

Application of eigenspace techniques to design of aircraft control systems p 508 A86-35360

Coordinated bank-to-turn autopilot design
p 509 A86-35384

Flight test trajectory controller synthesis with constrained eigenstructure assignment p 509 A86-35404

Transient model of a pneumatic ejector - Application to the simulation of aircraft bleed air temperature control systems p 489 A86-35405

High-speed, automatic controller design considerations for integrating array processor, multi-microprocessor, and host computer system architectures p 531 A86-35409

Synthesis of system responses - A nonlinear multivariable control design approach --- for engine control p 501 A86-35412

The application of systolic array processor technology to real-time control p 532 A86-36894

The influence of sampling rate on the dynamics and control of aeronautical systems p 511 A86-37061

LQG/LTR design of a robust flight controller for the STOL F-15
[AD-A164111] p 512 N86-24708

Laser beam duct pressure controller system
[AD-D012017] p 525 N86-24984

Control technology for future aircraft propulsion systems
[PAPER-14] p 506 N86-25356

Tine domain design of robust controllers for LQG (Linear Quadratic Gaussian); application to large space structures
[AD-A163635] p 533 N86-26074

**CONTROL THEORY**

1985 American Control Conference, 4th, Boston, MA, June 19-21, 1985, Proceedings. Volumes 1, 2, & 3
p 531 A86-35326

Locally optimal control in systems with delay --- for flight vehicle stabilization p 510 A86-35984

Multivariable control law design for enhanced air combat maneuvering. F-15/STOL (Short Take-Off and Landing) derivative fighter
[AD-A164017] p 512 N86-24706

Multivariable output control law design for the STOL (Short Takeoff and Landing) F-15 in landing configuration
[AD-A164516] p 498 N86-25340

**CONTROLLED ATMOSPHERES**

Automating knowledge acquisition in a flightline robot
[AD-A163829] p 525 N86-24997

**CONTROLLERS**

High-speed, automatic controller design considerations for integrating array processor, multi-microprocessor, and host computer system architectures p 531 A86-35409

Eigenstructure assignment and its application in design of flight control systems
[NASA-TM-88411] p 511 N86-24701

**CORROSION TESTS**

Na2SO4 induced corrosion of nickel at high temperature p 517 A86-37073

**COST ANALYSIS**

Spare parts pricing - Impact on logistics support
p 537 A86-35647

**COST EFFECTIVENESS**

Evaluation of propfan propulsion applied to general aviation
[NASA-CR-175020] p 503 N86-24695

**COST ESTIMATES**

Cost estimating relationships for fixed wing aircraft: List price versus empty weight
[AD-A164196] p 537 N86-25300

**COSTS**

An LQG up-and away flight control design for the STOL F-15 aircraft
[AD-A164108] p 512 N86-24707

An LQG up-and away flight control design for the STOL F-15 aircraft
[AD-A164108] p 512 N86-25384

**COWLINGS**

The material development, component manufacture and post-service evaluation of RB 211-524 cowl doors utilising carbon fibre composite materials p 523 A86-37106

Structural certification and in-service flight experience of the RB 211-524 fan cowl doors utilising carbon fibre composite materials p 496 A86-37108

**CRACK CLOSURE**

Aspects of small crack growth p 518 N86-25370

**CRACK INITIATION**

Some aspects of variability in fatigue crack initiation and propagation in thick aluminium alloy sections
p 522 A86-36176

**CRACK PROPAGATION**

A completely integrated system for the treatment of crack growth test data p 531 A86-34635

The development of a system for the study of fatigue crack growth up to 2000 Hz p 520 A86-34641

ARALL (Aramid Reinforced Aluminium Laminates), - A hybrid composite with a great resistance against fatigue crack propagation
[DGLR PAPER 85-137] p 515 A86-35180

Some aspects of variability in fatigue crack initiation and propagation in thick aluminium alloy sections
p 522 A86-36176

Comparison of the strength and damage tolerance of aluminium alloys p 516 A86-36178

Thermal-mechanical fatigue behavior of nickel-base superalloys
[NASA-CR-175048] p 518 N86-24818

Constant-Load-Amplitude fatigue crack growth testing of cast aluminum alloys A201-T7 and A357-T6
[AD-A163494] p 518 N86-24821

Aspects of small crack growth p 518 N86-25370

Crack growth in near-alpha titanium alloys
p 526 N86-25371

**CRASH LANDING**

Crash response data system for the controlled impact demonstration (CID) of a full-scale transport aircraft
p 500 A86-37045

**CRASHES**

Simulation of aircraft seat response to a crash environment p 530 A86-36879

**CRASHWORTHINESS**

Influences of two landing gear designs on helicopter crashworthiness and weights p 492 A86-35632

A skin-stringer design for a crashworthy composite fuselage for the Hughes 500E helicopter
p 492 A86-35637

Effects of variations in crashworthiness criteria on Sikorsky S-75 ACAP landing gear weights
p 492 A86-35638

Survey of crashworthiness achievements on Aerospatiale helicopters p 493 A86-35642

Tilt rotor crashworthiness p 493 A86-35661

The design and development of new crashworthy seats for Navy helicopters p 494 A86-35662

The Hughes integrated approach to helicopter crashworthiness Past, present, and future
p 494 A86-35663

Army helicopter crashworthiness - Loading the battlefield dice in our favor p 494 A86-35664

Crashworthy design of rotorcraft - A basic research approach p 494 A86-35665

Simulation of aircraft seat response to a crash environment p 530 A86-36879

KRASH dynamics analysis modeling: Transport airplane controlled impact demonstration test
[DOT/FAA/CT-85/9-REV] p 483 N86-25331

**CREW STATIONS**

Cockpit automation technology - A further look
p 499 A86-33814

Sikorsky Aircraft crew station technology research helicopter
[SAE PAPER 851780] p 490 A86-35442

**CREW WORKSTATIONS**

Applicability of using the CAR-II model in design and evaluation of multioperator workstations with shared controls p 520 A86-33805

**CROSS COUPLING**

Characteristics pertaining to a stiffness cross-coupled Jeffcott model
[ASME PAPER 85-DET-144] p 523 A86-37071

**CROSS FLOW**
Natural laminar flow flight experiments on a swept wing business jet-boundary layer stability analyses
[NASA-CR-3975] p 478 N86-24659

**CRUISING FLIGHT**
Details on the optimization of cruising drag of the Airbus A320
[DGLR PAPER 85-089] p 487 A86-35152
Design of an advanced flight planning system
p 481 A86-35365

**CRYOGENIC WIND TUNNELS**
Vapor-screen flow-visualization experiments in the NASA Langley 0.3-m transonic cryogenic tunnel
[NASA-CR-3984] p 478 N86-24661

**CRYOGENICS**
Passive eddy-current damping as a means of vibration control in cryogenic turbomachinery
[NASA-TP-2562] p 515 N86-24722

**CURING**
Materials for emergency repair of runways
[AD-A164225] p 514 N86-25385

**CURRENT DISTRIBUTION**
The effect of the electrode gap geometry on current distribution during electrochemical rounding of edges
p 522 A86-35980

**CUSHIONS**
A review of the pilot backache problem in tha CH113 Labrador helicopter
[AD-A164011] p 530 N86-25113

**CYCLIC LOADS**
The development of a system for the study of fatigue crack growth up to 2000 Hz p 520 A86-34641
Evaluation of cyclic spin pit tests for the damage tolerance of disks p 507 N86-25379
TURBISTAN: A standard load sequence for aircraft engine discs p 526 N86-25380

**CYLINDRICAL BODIES**
Experimental study of the supersonic turbulent boundary layer on a blunted axisymmetric body
[AD-A163736] p 479 N86-24669

## D

**DAMAGE**
Damage Tolerance Concepts for Critical Engine Components
[AGARD-CP-393] p 506 N86-25360
Materials for emergency repair of runways
[AD-A164225] p 514 N86-25385

**DAMAGE ASSESSMENT**
Assessment of structural damage in composites utilizing acoustic emission technology p 521 A86-35651
Comparison of the strength and damage tolerance of aluminium alloys p 516 A86-36178
KRASH dynamics analysis modeling: Transport airplane controlled impact demonstration test
[DOT/FAA/CT-85/9-REV] p 483 N86-25331
Damage tolerance concepts for critical engine components p 506 N86-25361
AGARD Cooperative Test Progamme on titanium alloy engine disc material p 507 N86-25369
Evaluation of cyclic spin pit tests for the damage tolerance of disks p 507 N86-25379

**DAMPING**
Passive eddy-current damping as a means of vibration control in cryogenic turbomachinery
[NASA-TP-2562] p 515 N86-24722

**DATA ACQUISITION**
Crash response data system for the controlled impact demonstration (CID) of a full-scale transport aircraft
p 500 A86-37045
Real-time flight test PCM data acquisition monitor
[AD-A164035] p 524 N86-24897

**DATA BASES**
Stored terrain data base aided pilotage for helicopters
p 499 A86-35606
Precision IMC approaches to heliports using collocated MLS --- Instrument Meteorological Conditions
p 485 A86-35610
Evaluation of a frequency response technique for aircraft system identification
[AD-A164367] p 497 N86-25339
AFOS (Automation of Field Operations and Services) terminal forecast decoding
[PB86-147360] p 529 N86-25954

**DATA MANAGEMENT**
Real-time flight test PCM data acquisition monitor
[AD-A164035] p 524 N86-24897

**DATA PROCESSING**
A completely integrated system for the treatment of crack growth test data p 531 A86-34635

**DATA SAMPLING**
The influence of sampling rate on the dynamics and control of aeronautical systems p 511 A86-37061

**DATA STORAGE**
Development and evaluation of math library routines for a 1750A airborne microcomputer
[AD-A164050] p 533 N86-26030

**DATA SYSTEMS**
Crash response data system for the controlled impact demonstration (CID) of a full-scale transport aircraft
p 500 A86-37045

**DC 10 AIRCRAFT**
Practical considerations in optimal flight management computations p 481 A86-35367

**DECELERATION**
Altitude ignition/lean decel study
[AD-A163052] p 518 N86-24781

**DECISION MAKING**
Head-up display (HUD) utility. II - Runway to HUD transitions monitoring eye focus and decision times
p 498 A86-33802
Application of artificial intelligence to improve aircraft survivability
[AD-A164172] p 483 N86-24674

**DEFECTS**
Small defect characterization in powder metallurgy materials p 526 N86-25373

**DEFLECTION**
Experimental assessment of vortex retaining cavity flaps for maneuverability improvement on delta wing fighter aircraft
[AD-A164104] p 497 N86-24690

**DEICERS**
VSTOL aircraft ice protection design considerations
p 493 A86-35654

**DEICING**
Evaluation of capillary reinforced composites
[NASA-CR-175061] p 517 N86-24760

**DELAMINATING**
The effect of center delamination on the instability of composite cylindrical panels p 520 A86-34642

**DELTA WINGS**
Rising of the Ferrie point on the windward side of delta wings p 474 A86-34485
Inviscid vortex-stretched turbulent shear-layer flow computed around a cranked delta wing
p 475 A86-35253
Vapor-screen flow-visualization experiments in the NASA Langley 0.3-m transonic cryogenic tunnel
[NASA-CR-3984] p 478 N86-24661
Investigation of rolling-up and interaction of leading-edge and trailing-edge vortex sheets on a slender delta wing
[AD-A163692] p 479 N86-24668
Experimental assessment of vortex retaining cavity flaps for maneuverability improvement on delta wing fighter aircraft
[AD-A164104] p 497 N86-24690
Experimental study of apex fences for lift enhancement on a highly swept delta wing configuration
[AD-A163877] p 512 N86-24705
Hypersonic flow around a wing at large angles of attack with detached compression jump p 480 N86-25534
Flow around delta wings with broken-line leading edges p 481 N86-25560

**DEPOSITS**
Emission FTIR analyses of thin microscopic patches of jet fuel residues deposited on heated metal surfaces
[NASA-CR-176786] p 519 N86-25502

**DESIGN ANALYSIS**
Can we develop the 1.5 million pound aerospace plane? p 515 A86-34195
From wind tunnel to large aircraft
[DGLR PAPER 85-088] p 487 A86-35151
Comparative investigation of optimization procedures in aircraft preliminary design
[DGLR PAPER 85-119] p 487 A86-35170
Influences of two landing gear designs on helicopter crashworthiness and weights p 492 A86-35632
Damage tolerant composite design development
p 524 A86-37119
Fourteenth NASTRAN Users' Colloquium
[NASA-CP-2419] p 527 N86-25823
Experiences with NASTRAN in a multidisciplinary optimization environment p 527 N86-25831

**DETECTION**
Application of FDI metrics to detection and isolation of sensor failures in turbine engines p 501 A86-35400
A real-time simulation evaluation of an advanced detection. Isolation and accommodation algorithm for sensor failures in turbine engines
[NASA-TM-87289] p 504 N86-24697

**DIFFRACTION PATTERNS**
Characteristics of the interaction of interference and diffraction flows at supersonic velocities
p 478 A86-36459

**DIGITAL COMPUTERS**
Digital electronic engine control F-15 overview
[PAPER-1] p 504 N86-25343

**DIGITAL SIMULATION**
Procedures for the digital simulation of helicopter propulsion systems
[DGLR PAPER 85-115] p 501 A86-35168
Multivariable control law design for enhanced air combat maneuvering. F-15/STOL (Short Take-Off and Landing) derivative fighter
[AD-A164017] p 512 N86-24706

**DIGITAL SYSTEMS**
Flying hands off to a hover — automatic flight control in helicopters p 507 A86-34193
Application of digital/electric systems to advanced technology aircraft
[SAWE PAPER 1639] p 488 A86-35203
SR-71 digital automatic flight and inlet control system
[SAE PAPER 851977] p 509 A86-35457
Digital correction of the readings of an aircraft fuel-measurement system p 500 A86-36725
Pitch-location effects on dynamic stall
[AD-A164322] p 480 N86-25329
Evaluation of a frequency response technique for aircraft system identification
[AD-A164367] p 497 N86-25339
Real-time in-flight thrust calculation on a digital electronic engine control-equipped F100 engine in an F-15 airplane
[PAPER-13] p 506 N86-25355

**DIGITAL TECHNIQUES**
FAA certification criteria for lightning protection of helicopter digital engine control p 482 A86-35609
Digital Electronic Engine Control (DEEC) Flight Evaluation in an F-15 Airplane
[NASA-CP-2298] p 504 N86-25342
Digital electronic engine control F-15 overview
[PAPER-1] p 504 N86-25343
Digital electronic engine control history
[PAPER-2] p 504 N86-25344
F-15 digital electronic engine control system description
[PAPER-3] p 504 N86-25345
NASA Lewis F100 engine testing
[PAPER-4] p 504 N86-25346
Effects of inlet distortion on a static pressure probe mounted on the engine hub in an F-15 airplane
[PAPER-5] p 505 N86-25347
Flight testing the digital electronic engine control in the F-15 airplane
[PAPER-6] p 505 N86-25348
Digital electronic engine control fault detection and accommodation flight evaluation
[PAPER-7] p 505 N86-25349
Airstart performance of a digital electronic engine control system on an F100 engine
[PAPER-8] p 505 N86-25350
Flight evaluation of a hydromechanical backup control for the digital electronic engine control system in an F100 engine
[PAPER-9] p 505 N86-25351
Backup control airstart performance on a digital electronic engine control-equipped F100-engine
[PAPER-10] p 505 N86-25352
Augmentor transient capability of an F100 engine equipped with a digital electronic engine control
[PAPER-11] p 505 N86-25353
Investigation of a nozzle instability on an F100 engine equipped with a digital electronic engine control
[PAPER-12] p 506 N86-25354
Control technology for future aircraft propulsion systems
[PAPER-14] p 506 N86-25356

**DIRECTIONAL CONTROL**
In flight access to minimum vectoring altitudes - A pilot's perspective
[SAE PAPER 851837] p 485 A86-35444
Directional handling qualities requirements for nap of the earth (NOE) tasks p 510 A86-35622
Experimental assessment of vortex retaining cavity flaps for maneuverability improvement on delta wing fighter aircraft
[AD-A164104] p 497 N86-24690

**DISPLACEMENT MEASUREMENT**
Photogrammetry as a means of mapping postbuckled composite surfaces p 520 A86-34639

**DISPLAY DEVICES**
A preliminary study of the basic display/guidance requirements for flying near optimal trajectories
p 499 A86-35366
Stored terrain data base aided pilotage for helicopters
p 499 A86-35606
Aircraft lighting systems p 491 A86-35607
An integrated display for vertical and translational flight Eight factors affecting pilot performance
p 529 A86-36175

**DOMAINS**
Study of the effects of discretizing quantitative feedback theory analog control system designs
[AD-A164209] p 533 N86-25174

Time domain design of robust controllers for LQG (Linear Quadratic Gaussian); application to large space structures
[AD-A163635] p 533 N86-26074

**DOORS**

The material development, component manufacture and post-service evaluation of RB 211-524 cowl doors utilising carbon fibre composite materials p 523 A86-37106

Structural certification and in-service flight experience of the RB 211-524 fan cowl doors utilising carbon fibre composite materials p 496 A86-37108

**DOWNWASH**

The induced downwash and lift on a wing of high aspect ratio in unsteady motion p 474 A86-34160

**DRAG REDUCTION**

Details on the optimization of cruising drag of the Airbus A320
[DGLR PAPER 85-089] p 487 A86-35152

Advanced boundary layer transition measurement methods for flight applications
[AIAA PAPER 86-9786] p 500 A86-37083

**DROP TESTS**

Drop testing and analysis of six-foot diameter graphite-epoxy frames p 517 A86-37068

**DUCTS**

Laser beam duct pressure controller system
[AD-D012017] p 525 N86-24984

**DYNAMIC CHARACTERISTICS**

Review and evaluation of recent developments in melic inlet dynamic flow distortion prediction and computer program documentation and user's manual estimating maximum instantaneous inlet flow distortion from steady-state total pressure measurements with full, limited, or no dynamic data
[NASA-CR-176765] p 525 N86-24955

**DYNAMIC MODELS**

Procedures for the digital simulation of helicopter propulsion systems
[DGLR PAPER 85-115] p 501 A86-35168

**DYNAMIC RESPONSE**

Calculation of the dynamic response of a flight vehicle using a discrete-continuous model p 476 A86-35979

The use of ellipsoidal solids to display human body dynamic response p 530 A86-36852

**DYNAMIC STRUCTURAL ANALYSIS**

Fourteenth NASTRAN Users' Colloquium
[NASA-CP-2419] p 527 N86-25823

Dynamic and aeroelastic analyses of turbosystems in NASTRAN p 527 N86-25826

**DYNAMICAL SYSTEMS**

The influence of sampling rate on the dynamics and control of aeronautical systems p 511 A86-37061

Characteristics pertaining to a stiffness cross-coupled Jeffcott model
[ASME PAPER 85-DET-144] p 523 A86-37071

## E

**EDDY CURRENTS**

Passive eddy-current damping as a means of vibration control in cryogenic turbomachinery
[NASA-TP-2562] p 515 N86-24722

**EIGENVALUES**

Eigenstructure assignment: A tutorial - I theory --- for linear time invariant systems p 531 A86-35358

Eigenstructure assignment and its application in design of flight control systems
[NASA-TM-88411] p 511 N86-24701

**EIGENVECTORS**

Eigenstructure assignment: A tutorial - I theory --- for linear time invariant systems p 531 A86-35358

**EJECTORS**

Transient model of a pneumatic ejector - Application to the simulation of aircraft bleed air temperature control systems p 489 A86-35405

**ELASTIC DEFORMATION**

Determination of wing deformation in wind tunnel models using stress measurement section technology
[DGLR PAPER 85-091] p 474 A86-35154

**ELASTIC PROPERTIES**

Method to determine the complete three-dimensional elastic compliance matrix of composite materials
p 517 A86-37134

**ELASTODYNAMICS**

Fatigue life in a coupled problem concerning the motion of a flexible wing p 474 A86-35082

**ELECTRIC CONTROL**

An airframer's view of an electric fighter
[SAWE PAPER 1662] p 488 A86-35208

**ELECTROCHEMICAL MACHINING**

The effect of the electrode gap geometry on current distribution during electrochemical rounding of edges
p 522 A86-35980

**ELECTROMAGNETIC INTERACTIONS**

Comparison of absorption and radiation boundary conditions using a time-domain three-dimensional finite difference electromagnetic computer code
[AD-A163828] p 532 N86-25149

**ELECTRONIC AIRCRAFT**

An airframer's view of an electric fighter
[SAWE PAPER 1662] p 488 A86-35208

**ELECTRONIC CONTROL**

Digital electronic engine control F-15 overview
[PAPER-1] p 504 N86-25343

Digital electronic engine control history
[PAPER-2] p 504 N86-25344

F-15 digital electronic engine control system description
[PAPER-3] p 504 N86-25345

NASA Lewis F100 engine testing
[PAPER-4] p 504 N86-25346

Flight testing the digital electronic engine control in the F-15 airplane
[PAPER-6] p 505 N86-25348

**ELECTRONIC EQUIPMENT**

Weight assessment of electronic boxes --- for aircraft design
[SAWE PAPER 1661] p 499 A86-35207

Dual mode heat exchanger
[AD-D012156] p 524 N86-24944

**ELECTRONIC EQUIPMENT TESTS**

An avionics software test and evaluation technique
p 499 A86-35650

**ELECTRONIC PACKAGING**

Weight assessment of electronic boxes --- for aircraft design
[SAWE PAPER 1661] p 499 A86-35207

**ELECTRONIC WARFARE**

Report on interest expressed in some Australian Defence Establishment products displayed at the 1985 Paris Air Show
[AD-A160807] p 498 N86-25341

**ELLIPSOIDS**

The use of ellipsoidal solids to display human body dynamic response p 530 A86-36852

**EMERGENCIES**

Materials for emergency repair of runways
[AD-A164225] p 514 N86-25385

**ENCLOSURES**

Frameless transparencies for aircraft cockpit enclosures
[AD-D012155] p 497 N86-24689

**ENERGY ABSORPTION**

Effect of fiber and matrix maximum strain on the energy absorption of composite materials p 516 A86-35640

**ENGINE AIRFRAME INTEGRATION**

Simulation and measurement of engine influences in a two-jet aircraft model using model engines
[DGLR PAPER 85-092] p 513 A86-35155

**ENGINE CONTROL**

Synthesis of system responses - A nonlinear multivariable control design approach --- for engine control p 501 A86-35412

SR-71 digital automatic flight and inlet control system
[SAE PAPER 851977] p 509 A86-35457

FAA certification criteria for lightning protection of helicopter digital engine control p 482 A86-35609

Digital Electronic Engine Control (DEEC) Flight Evaluation in an F-15 Airplane
[NASA-CP-2298] p 504 N86-25342

Digital electronic engine control F-15 overview
[PAPER-1] p 504 N86-25343

Digital electronic engine control history
[PAPER-2] p 504 N86-25344

F-15 digital electronic engine control system description
[PAPER-3] p 504 N86-25345

NASA Lewis F100 engine testing
[PAPER-4] p 504 N86-25346

Effects of inlet distortion on a static pressure probe mounted on the engine hub in an F-15 airplane
[PAPER-5] p 505 N86-25347

Flight testing the digital electronic engine control in the F-15 airplane
[PAPER-6] p 505 N86-25348

Digital electronic engine control fault detection and accommodation flight evaluation
[PAPER-7] p 505 N86-25349

Airstart performance of a digital electronic engine control system on an F100 engine
[PAPER-8] p 505 N86-25350

Flight evaluation of a hydromechanical backup control for the digital electronic engine control system in an F100 engine
[PAPER-9] p 505 N86-25351

Investigation of a nozzle instability on an F100 engine equipped with a digital electronic engine control
[PAPER-12] p 506 N86-25354

Control technology for future aircraft propulsion systems
[PAPER-14] p 506 N86-25356

**ENGINE DESIGN**

Application of CFD design technology in development of the JVX engine inlet p 502 A86-35612

Aircraft engine technology windows (Lecture)
p 502 A86-36336

Front-line power p 503 A86-37096

Damage tolerance concepts for critical engine components p 506 N86-25361

Crack growth in near-alpha titanium alloys
p 526 N86-25371

Advanced quantitative methods for nondestructive evaluation p 519 N86-25376

**ENGINE FAILURE**

Fatigue failure of jet engine drive shafts
p 500 A86-33970

Extended range operation of twin-engine commercial airplanes
[SAE PAPER 851959] p 490 A86-35455

Damage tolerance concepts for critical engine components p 506 N86-25361

**ENGINE INLETS**

Application of CFD design technology in development of the JVX engine inlet p 502 A86-35612

A numerical analysis applied to high angle of attack three-dimensional inlets
[NASA-TM-87298] p 478 N86-24658

**ENGINE MONITORING INSTRUMENTS**

Robust detection, isolation, and accommodation for sensor failures --- in jet engine control systems
p 501 A86-35402

**ENGINE PARTS**

Stress analysis of gas turbine engine structures using the boundary element method p 520 A86-34444

The effect of the electrode gap geometry on current distribution during electrochemical rounding of edges
p 522 A86-35980

The material development, component manufacture and post-service evaluation of RB 211-524 cowl doors utilising carbon fibre composite materials p 523 A86-37106

Damage Tolerance Concepts for Critical Engine Components
[AGARD-CP-393] p 506 N86-25360

Manufacturing technology for nondestructive evaluation (NDE) system to implement Retirement For Cause (RFC) procedures for gas turbine engine components
p 507 N86-25368

AGARD Cooperative Test Progamme on titanium alloy engine disc material p 507 N86-25369

Small defect characterization in powder metallurgy materials p 526 N86-25373

**ENGINE STARTERS**

Backup control airstart performance on a digital electronic engine control-equipped F100-engine
[PAPER-10] p 505 N86-25352

**ENGINE TESTING LABORATORIES**

Survey of supersonic combustion ramjet research at Langley
[AIAA PAPER 86-0159] p 503 A86-37079

**ENGINE TESTS**

Practical diagnostics of aircraft gas turbines --- Russian book p 502 A86-35472

Adaptive fuel control testing p 502 A86-35615

NASA Lewis F100 engine testing
[PAPER-4] p 504 N86-25346

Engine cyclic durability by analysis and testing: Highlights of the spring 1984 PEP Meeting p 506 N86-25362

**ENTROPY**

Nonisentropic unsteady three dimensional small disturbance potential theory
[NASA-TM-87726] p 479 N86-24663

**ENVIRONMENT SIMULATION**

Simulation of aircraft seat response to a crash environment p 530 A86-36879

**EQUATIONS OF MOTION**

Use of state estimation to calculate angle-of-attack position error from flight test data
[AD-A163962] p 480 N86-24670

Movement of flexible wing at supersonic velocity under influence of random gust p 481 N86-25562

**ERROR ANALYSIS**

Digital electronic engine control fault detection and accommodation flight evaluation
[PAPER-7] p 505 N86-25349

**ETHYLENE**

Fireproof hydraulic brake system
[AD-A163542] p 497 N86-24688

**EULER EQUATIONS OF MOTION**

A comparison of solutions of the complete potential equation and the Euler equations for the transonic flow around the DFVLR-F4-wing
[DGLR PAPER 85-121] p 475 A86-35171

**EVALUATION**
A real-time simulation evaluation of an advanced detection. Isolation and accommodation algorithm for sensor failures in turbine engines
[NASA-TM-87289] p 504 N86-24697
An analysis of rig test disc failures
p 527 N86-25381

**EVAPORATION**
Altitude ignition/lean decel study
[AD-A163052] p 518 N86-24781

**EXHAUST NOZZLES**
Propulsion and Energetics Panel Working Group 14 on suitable averaging techniques in non-uniform internal flows
[AD-A133968] p 503 N86-24692

**EXPENDABLE STAGES (SPACECRAFT)**
Weights assessment for orbit-on-demand vehicles
[SAWE PAPER 1674] p 515 A86-35217

**EXPERIMENT DESIGN**
Application of the Optimal Control Model to the design of flight simulation experiments
[SAE PAPER 851903] p 532 A86-36942

**EXPERIMENTATION**
Natural laminar flow flight experiments on a swept wing business jet-boundary layer stability analyses
[NASA-CR-3975] p 476 N86-24659
An experimental investigation of reducing advanced turboprop cabin noise by wing shielding
[NASA-TM-87112] p 536 N86-25218

**EXPERT SYSTEMS**
Pilot Executive project - PILEX --- flight status monitor expert system
[SAE PAPER 851806] p 489 A86-35436
An engineering approach to the use of expert systems technology in avionics applications
[NASA-TM-88263] p 497 N86-24687
An application of adaptive learning to malfunction recovery
[NASA-CR-166620] p 533 N86-25169

**EXTERNAL TANKS**
Ground vibration test of an F-16 airplane with modified decoupler pylons
[NASA-TM-87634] p 496 N86-24685

**EXTINGUISHING**
Altitude ignition/lean decel study
[AD-A163052] p 518 N86-24781

# F

**F-106 AIRCRAFT**
Lateral and longitudinal aerodynamic stability and control parameters of the basic vortex flap research aircraft as determined from flight test data
[NASA-TM-87711] p 512 N86-24703

**F-111 AIRCRAFT**
Weight control of aircraft modification projects
[SAWE PAPER 1683] p 489 A86-35224

**F-15 AIRCRAFT**
Summary of results of NASA F-15 flight research program
[AIAA PAPER 86-9761] p 496 A86-37064
Multivariable control law design for enhanced air combat maneuvering. F-15/STOL (Short Take-Off and Landing) derivative fighter
[AD-A164017] p 512 N86-24706
Multivariable output control law design for the STOL (Short Takeoff and Landing) F-15 in landing configuration
[AD-A164516] p 498 N86-25340
Digital Electronic Engine Control (DEEC) Flight Evaluation in an F-15 Airplane
[NASA-CP-2298] p 504 N86-25342
F-15 digital electronic engine control system description
[PAPER-3] p 504 N86-25345

**F-16 AIRCRAFT**
Ground vibration test of an F-16 airplane with modified decoupler pylons
[NASA-TM-87634] p 496 N86-24685

**FABRICATION**
Advanced structural casting applications for a gas turbine engine p 521 A86-35658
Using the perturbation method for determining the die forging parameters for aircraft parts p 522 A86-35997

**FACILITIES**
Too little time - Too little money --- low cost flight simulation facility
[SAE PAPER 851904] p 532 A86-36943

**FAILURE ANALYSIS**
Fatigue failure of jet engine drive shafts
p 500 A86-33970
Assessment of structural damage in composites utilizing acoustic emission technology p 521 A86-35651
Postbuckling failure of composite panels
p 523 A86-37112
The evaluation of the OSGLR algorithm for restructurable controls
[NASA-CR-178063] p 485 N86-24678
Engine cyclic durability by analysis and testing: Highlights of the spring 1984 PEP Meeting p 506 N86-25362

**FAILURE MODES**
The evaluation of the OSGLR algorithm for restructurable controls
[NASA-CR-178063] p 485 N86-24678
A real-time simulation evaluation of an advanced detection. Isolation and accommodation algorithm for sensor failures in turbine engines
[NASA-TM-87289] p 504 N86-24697

**FAN BLADES**
Intrablade velocity mapping in transonic fan passages of gas turbine p 474 A86-34411
Digital electronic engine control history
[PAPER-2] p 504 N86-25344

**FANS**
The superposition distortion index --- in axial flow fans of turbofan engines p 500 A86-34279

**FAR FIELDS**
Aircraft Noise Prediction Program theoretical manual: Propeller aerodynamics and noise
[NASA-TM-83199-PT-3] p 536 N86-25220

**FATIGUE (MATERIALS)**
Thermal-mechanical fatigue behavior of nickel-base superalloys
[NASA-CR-175048] p 518 N86-24818
Constant-Load-Amplitude fatigue crack growth testing of cast aluminum alloys A201-T7 and A357-T6
[AD-A163494] p 518 N86-24821

**FATIGUE LIFE**
Fatigue failure of jet engine drive shafts
p 500 A86-33970
Fatigue life in a coupled problem concerning the motion of a flexible wing p 474 A86-35082
ARALL (Aramid Reinforced Aluminium Laminates), - A hybrid composite with a great resistance against fatigue crack propagation
[DGLR PAPER 85-137] p 515 A86-35180
Preliminary estimate of fatigue life for dynamic components of a new helicopter p 493 A86-35639
Engine cyclic durability by analysis and testing: Highlights of the spring 1984 PEP Meeting p 506 N86-25362
Small defect characterization in powder metallurgy materials p 528 N86-25373

**FATIGUE TESTS**
The development of a system for the study of fatigue crack growth up to 2000 Hz p 520 A86-34641
Process development and test evaluation of cast, HIP and heat treated titanium UH-60A M.R. Damper Bracket
p 516 A86-35641
Development of a composite tail rotor blade for the MH-53E p 493 A86-35649

**FAULT TOLERANCE**
The impact of accommodating defects on the efficiency of aircraft design
[SAWE PAPER 1635] p 488 A86-35201

**FEEDBACK CONTROL**
Gain-scheduled multivariable cotnrol for the GE-21 turbofan engine using the LQG/LTR methodology
p 501 A86-35334
Eigenstructure assignment: A tutorial - I theory --- for linear time invariant systems p 531 A86-35358
Coordinated bank-to-turn autopilot design
p 509 A86-35384
Synthesis of system responses - A nonlinear multivariable control design approach --- for engine control p 501 A86-35412
A research program in active control/aeroelasticity
[NASA-CR-176773] p 511 N86-24702
Multivariable control law design for enhanced air combat maneuvering. F-15/STOL (Short Take-Off and Landing) derivative fighter
[AD-A164017] p 512 N86-24706
An LQG up-and away flight control design for the STOL F-15 aircraft
[AD-A164108] p 512 N86-24707
Study of the effects of discretizing quantitative feedback theory analog control system designs
[AD-A164209] p 533 N86-25174
Airstart performance of a digital electronic engine control system on an F100 engine
[PAPER-8] p 505 N86-25350
Flight evaluation of a hydromechanical backup control for the digital electronic engine control system in an F100 engine
[PAPER-9] p 505 N86-25351
Backup control airstart performance on a digital electronic engine control-equipped F100-engine
[PAPER-10] p 506 N86-25352
An LQG up-and away flight control design for the STOL F-15 aircraft
[AD-A164108] p 512 N86-25384

**FIBER COMPOSITES**
Effect of fiber and matrix maximum strain on the energy absorption of composite materials p 516 A86-35640

**FIBER REINFORCED COMPOSITES**
ARALL (Aramid Reinforced Aluminium Laminates), - A hybrid composite with a great resistance against fatigue crack propagation
[DGLP PAPER 85-137] p 515 A86-35180
Effect of fiber and matrix maximum strain on the energy absorption of composite materials p 516 A86-35640
Aramid fiber composites for general engineering
p 517 A86-37137

**FIBER STRENGTH**
Aramid fiber composites for general engineering
p 517 A86-37137

**FIGHTER AIRCRAFT**
The Soviet fighter - Four decades of development
p 486 A86-33969
Development trends in the case of high-performance aircraft
[DGLR PAPER 85-106] p 473 A86-35163
Configuration aspects of modern high-performance aircraft
[DGLR PAPER 85-130] p 486 A86-35176
An airframer's view of an electric fighter
[SAWE PAPER 1662] p 488 A86-35208
Sukhoi frogfoot p 495 A86-36333
Front-line power p 503 A86-37096
Experimental assessment of vortex retaining cavity flaps for maneuverability improvement on delta wing fighter aircraft
[AD-A164104] p 497 N86-24690
An LQG up-and away flight control design for the STOL F-15 aircraft
[AD-A164108] p 512 N86-24707
An LQG up-and away flight control design for the STOL F-15 aircraft
[AD-A164108] p 512 N86-25384

**FINITE DIFFERENCE THEORY**
Implicit, vectorizable schemes for the flux-difference split, three-dimensional Navier-Stokes equations
p 523 A86-37067
Comparison of absorption and radiation boundary conditions using a time-domain three-dimensional finite difference electromagnetic computer code
[AD-A163828] p 532 N86-25149

**FINITE ELEMENT METHOD**
A method for numerical analysis of the dynamics of a controlled rotor blade of a helicopter
p 486 A86-33998
Fourteenth NASTRAN Users' Colloquium
[NASA-CP-2419] p 527 N86-25823
Experiences with NASTRAN in a multidisciplinary optimization environment p 527 N86-25831

**FINS**
Flight investigation of Bell model 206 ring fin
p 491 A86-35624

**FIRE DAMAGE**
Aircraft accident report: Air Canada flight 797, McDonnell Douglas DC-9-32, C-FTLU, Greater Cincinnati International Airport, Covington, Kentucky, June 2, 1983
[PB86-910402] p 483 N86-25332

**FIRE PREVENTION**
Fireproof hydraulic brake system
[AD-A163542] p 497 N86-24688

**FIRES**
Data sources for parameters used in predictive modeling of fire growth and smoke spread
[PB86-130986] p 518 N86-24788

**FIXED WINGS**
Cost estimating relationships for fixed wing aircraft: List price versus empty weight
[AD-A164196] p 537 N86-25300

**FLAME RETARDANTS**
Fireproof hydraulic brake system
[AD-A163542] p 497 N86-24688

**FLAMMABILITY**
A transport model for flammability of premixed gases
p 516 A86-36874

**FLEXIBILITY**
Materials for emergency repair of runways
[AD-A164225] p 514 N86-25385

**FLEXIBLE BODIES**
Adaptive flutter suppression in the presence of turbulence p 508 A86-35370
Adaptive control robustness in flexible aircraft application p 511 A86-37070

**FLEXIBLE WINGS**
Fatigue life in a coupled problem concerning the motion of a flexible wing p 474 A86-35082
Movement of flexible wing at supersonic velocity under influence of random gust p 481 N86-25562

**FLIGHT ALTITUDE**
In flight access to minimum vectoring altitudes - A pilot's perspective
[SAE PAPER 851837] p 485 A86-35444

**FLIGHT CHARACTERISTICS**
The aerodynamics of rotor blades with ice shapes accreted in hover and in level flight p 476 A86-35856
Loads and motions of an F-106B flying through thunderstorms
[NASA-TM-87671] p 483 N86-24672

**FLIGHT CONDITIONS**
Aircraft accident/incident summary reports: Denver, Colorado, August 19, 1983; Blountville, Tennessee, July 16, 1983; Tucson, Arizona, February 6, 1983, Cockeysville, Maryland, April 28, 1984; Akron, Ohio, September 30, 1984; Seattle, Washington, October 18, 1984; Miami, Florida, November 11, 1983
[PB85-910409] p 483 N86-24675

**FLIGHT CONTROL**
Applicability of using the CAR-II model in design and evaluation of multioperator workstations with shared controls p 529 A86-33805
Helicopter flight control with one hand
p 529 A86-34823
An application of self-tuning regulator to GLA system of an aircraft --- Gust Load Alleviation
p 508 A86-34826
LMR-83 - Inertial measurement unit for flight regulation and navigation
[DGLR PAPER 85-132] p 508 A86-35177
Eigenstructure assignment: A tutorial - I theory --- for linear time invariant systems p 531 A86-35358
Flight test trajectory controller synthesis with constrained eigenstructure assignment p 509 A86-35404
Front seat on the future --- in airbus 320
p 509 A86-35563
Probabilistic modeling of fields of atmospheric turbulence and sea roughness with reference to the study of complex systems --- for flight control
p 526 A86-36480
Simulation of aircraft components for training purposes
[SAE PAPER 851965] p 496 A86-36946
Nonlinear lift control at high speed and high angle of attack using vortex flow technology p 478 A86-37050
Adaptive control robustness in flexible aircraft application p 511 A86-37070
Aircraft accident/incident summary reports: Denver, Colorado, August 19, 1983; Blountville, Tennessee, July 16, 1983; Tucson, Arizona, February 6, 1983, Cockeysville, Maryland, April 28, 1984; Akron, Ohio, September 30, 1984; Seattle, Washington, October 18, 1984; Miami, Florida, November 11, 1983
[PB85-910409] p 483 N86-24675
Eigenstructure assignment and its application in design of flight control systems
[NASA-TM-88411] p 511 N86-24701
An LQG up-and away flight control design for the STOL F-15 aircraft
[AD-A164108] p 512 N86-24707
An empirical study of flight control software reliability
[NASA-CR-178058] p 532 N86-25145
An application of adaptive learning to malfunction recovery
[NASA-CR-166620] p 533 N86-25169
Study of the effects of discretizing quantitative feedback theory analog control system designs
[AD-A164209] p 533 N86-25174
An LQG up-and away flight control design for the STOL F-15 aircraft
[AD-A164108] p 512 N86-25384
Role of optimization methods in improvement of flight control for airplanes p 513 N86-25603

**FLIGHT CREWS**
Cockpit and cabin crew coordination and communication
[SAE PAPER 851916] p 473 A86-35448
Cockpit communication and aircraft safety - An empirical study
[SAE PAPER 851856] p 482 A86-35451
Faulty cockpit communication as a factor in the failure of flight 90
[SAE PAPER 851859] p 482 A86-35452

**FLIGHT HAZARDS**
Application of artifical intelligence to improve aircraft survivability
[AD-A164172] p 483 N86-24674

**FLIGHT MANAGEMENT SYSTEMS**
Design of an advanced flight planning system
p 481 A86-35365
Practical considerations in optimal flight management computations p 481 A86-35367
Time navigation benefits in en route metered ATC
p 482 A86-35368
A computer controlled autopilot and an annunciation system for light aircraft p 511 A86-36871

**FLIGHT MECHANICS**
Role of optimization methods in improvement of flight control for airplanes p 513 N86-25603

**FLIGHT OPERATIONS**
FAA/HAI helicopter flight operations noise tests and initial results p 535 A86-35619

**FLIGHT OPTIMIZATION**
Pilot Executive project - PILEX --- flight status monitor expert system
[SAE PAPER 851806] p 489 A86-35436
Maximum-range passive flight p 535 A86-36467

**FLIGHT PATHS**
Maximum-range passive flight p 535 A86-36467
Pressure based separation in the upper airspace
[CAR-8614] p 486 N86-24679

**FLIGHT PLANS**
Design of an advanced flight planning system
p 481 A86-35365

**FLIGHT SAFETY**
Setting acceptable levels of safety for the National Airspace System p 481 A86-33780
Development of an authoritative aid to wind shear training
[SAE PAPER 851919] p 482 A86-35449
United Airlines windshear training update
[SAE PAPER 851920] p 482 A86-35450
Faulty cockpit communication as a factor in the failure of flight 90
[SAE PAPER 851859] p 482 A86-35452
The design of the EH101 for safety and performance
p 491 A86-35629
Performance degradation of helicopters due to icing - A review p 494 A86-35668
Pressure based separation in the upper airspace
[CAR-8614] p 486 N86-24679

**FLIGHT SIMULATION**
Practical considerations in optimal flight management computations p 481 A86-35367
Assessment of rotorcraft agility and maneuverability with a pilot-in-the-loop simulation p 510 A86-35623
Thermal scene generators p 522 A86-36805
Flight simulation/simulators; Proceedings of the Aerospace Technology Conference and Exposition, Long Beach, CA, October 14-17, 1985
[SAE SP-634] p 473 A86-36939
The role of flight simulation in helicopter crew station design
[SAE PAPER 851900] p 530 A86-36940
Engineering flight simulation - A revolution of change
[SAE PAPER 851901] p 513 A86-36941
Application of the Optimal Control Model to the design of flight simulation experiments
[SAE PAPER 851903] p 532 A86-36942
Too little time - Too little money --- low cost flight simulation facility
[SAE PAPER 851904] p 532 A86-36943
Capabilities of airborne and ground based flight simulation
[SAE PAPER 851944] p 513 A86-36944
The influence of sampling rate on the dynamics and control of aeronautical systems p 511 A86-37061
Lateral and longitudinal aerodynamic stability and control parameters of the basic vortex flap research aircraft as determined from flight test data
[NASA-TM-87711] p 512 N86-24703
Theoretical three-and four-axis gimbal robot wrists
[NASA-TP-2584] p 533 N86-25168
Evaluation of a frequency response technique for aircraft system identification
[AD-A164367] p 497 N86-25339

**FLIGHT SIMULATORS**
A preliminary study of the basic display/guidance requirements for flying near optimal trajectories
p 499 A86-35366
The flying simulator and technology carrier ATTAS from DFVLR p 490 A86-35520
Directional handling qualities requirements for nap of the earth (NOE) tasks p 510 A86-35622
A comparative study of an articulated integrated side-arm controller in a variable stability helicopter
p 510 A86-35626
Flight simulation/simulators; Proceedings of the Aerospace Technology Conference and Exposition, Long Beach, CA, October 14-17, 1985
[SAE SP-634] p 473 A86-36939
Capabilities of airborne and ground based flight simulation
[SAE PAPER 851944] p 513 A86-36944
Ada for Simulators
[SAE PAPER 851964] p 532 A86-36945
Techniques for increasing the update rate of real-time dynamic computer graphic displays p 523 A86-37072
Flight testing for better flight training simulators
[AIAA PAPER 86-9728] p 496 A86-37081
Langley aerospace test highlights, 1985
[NASA-TM-87703] p 537 N86-26276

**FLIGHT STABILITY TESTS**
Lateral and longitudinal aerodynamic stability and control parameters of the basic vortex flap research aircraft as determined from flight test data
[NASA-TM-87711] p 512 N86-24703

**FLIGHT TEST VEHICLES**
Use of state estimation to calculate angle-of-attack position error from flight test data
[AD-A163962] p 480 N86-24670

**FLIGHT TESTS**
SHARP (Stationary High Altitude Relay Platform) - Rectenna and low altitude tests p 519 A86-33944
First tests of an onboard MLS receiver
p 484 A86-33988
Estimation of transport airplane aerodynamics using multiple stepwise regression p 489 A86-35385
Flight test trajectory controller synthesis with constrained eigenstructure assignment p 509 A86-35404
Development and flight test of a helicopter, X-band, portable precision landing system concept
p 485 A86-35608
Description and initial flight experiments - Boeing ARTI test bed --- Advanced Rotorcraft Technology Integration
p 493 A86-35652
RSRA flight development test in the airplane configuration --- Rotor Systems Research Aircraft
p 493 A86-35653
Summary of results of NASA F-15 flight research program
[AIAA PAPER 86-9761] p 496 A86-37064
Flight testing for better flight training simulators
[AIAA PAPER 86-9728] p 496 A86-37081
AV-8B High Angle of Attack/departure resistance system flight test program
[AIAA PAPER 86-9729] p 496 A86-37082
Natural laminar flow flight experiments on a swept wing business jet-boundary layer stability analyses
[NASA-CR-3975] p 478 N86-24659
Computed centerline MLS (Microwave Landing System) approach demonstration at Washington National Airport
[AD-A163722] p 486 N86-24681
Fireproof hydraulic brake system
[AD-A163542] p 497 N86-24688
Real-time flight test PCM data acquisition monitor
[AD-A164035] p 524 N86-24897
Evaluation of a frequency response technique for aircraft system identification
[AD-A164367] p 497 N86-25339
Digital Electronic Engine Control (DEEC) Flight Evaluation in an F-15 Airplane
[NASA-CP-2298] p 504 N86-25342
Digital electronic engine control F-15 overview
[PAPER-1] p 504 N86-25343
Digital electronic engine control history
[PAPER-2] p 504 N86-25344
NASA Lewis F100 engine testing
[PAPER-4] p 504 N86-25346
Flight testing the digital electronic engine control in the F-15 airplane
[PAPER-6] p 505 N86-25348

**FLIGHT TRAINING**
Flight testing for better flight training simulators
[AIAA PAPER 86-9728] p 496 A86-37081

**FLOW DEFLECTION**
Characteristics of the interaction of interference and diffraction flows at supersonic velocities
p 478 A86-36459
Hypersonic flow around a wing at large angles of attack with detached compression jump p 480 N86-25534
Supersonic flow around blunt perforated shields
p 480 N86-25558

**FLOW DISTORTION**
The superposition distortion index --- in axial flow fans of turbofan engines p 500 A86-34279
Review and evaluation of recent developments in melic inlet dynamic flow distortion prediction and computer program documentation and user's manual estimating maximum instantaneous inlet flow distortion from steady-state total pressure measurements with full, limited, or no dynamic data
[NASA-CR-176765] p 525 N86-24955
Effects of inlet distortion on a static pressure probe mounted on the engine hub in an F-15 airplane
[PAPER-5] p 505 N86-25347

**FLOW DISTRIBUTION**
Flow field and near and far sound field of a subsonic jet p 476 A86-35855
The development of laser speckle velocimetry for the measurement of vortical flow fields
[AIAA PAPER 86-0768] p 523 A86-37091
Nonisentropic unsteady three dimensional small disturbance potential theory
[NASA-TM-87726] p 479 N86-24663

Propulsion and Energetics Panel Working Group 14 on suitable averaging techniques in non-uniform internal flows
[AD-A133968] p 503 N86-24692

**FLOW GEOMETRY**
Inverse method with geometric constraints for transonic aerofoil design p 477 A86-36202

**FLOW MEASUREMENT**
International Symposium on Laser Anemometry, 2nd, Miami Beach, FL, November 17-22, 1985, Proceedings p 519 A86-34407
Laser anemometer measurements of the flow from a simulated fuel nozzle p 520 A86-34410

**FLOW THEORY**
The method of fundamental solutions in aerodynamics. II Applications to the theory of lifting surfaces in supersonic flow p 477 A86-36285

**FLOW VELOCITY**
Intrablade velocity mapping in transonic fan passages of gas turbine p 474 A86-34411

**FLOW VISUALIZATION**
Characteristics of the interaction of interference and diffraction flows at supersonic velocities p 478 A86-36459
Vapor-screen flow-visualization experiments in the NASA Langley 0.3-m transonic cryogenic tunnel
[NASA-CR-3984] p 478 N86-24661
Experimental study of apex fences for lift enhancement on a highly swept delta wing configuration
[AD-A163877] p 512 N86-24705

**FLUTTER**
Adaptive flutter suppression in the presence of turbulence p 508 A86-35370
Ground vibration test of an F-16 airplane with modified decoupler pylons
[NASA-TM-87634] p 496 N86-24685
NASA Lewis F100 engine testing
[PAPER-4] p 504 N86-25346

**FLUTTER ANALYSIS**
Flutter analysis of low aspect ratio wings p 527 N86-25838

**FLY BY WIRE CONTROL**
Pilot interface with fly-by-wire control systems
[SAE PAPER 851836] p 509 A86-35443

**FOKKER AIRCRAFT**
Fokker 50 - Replacing a legend p 487 A86-34475

**FOKKER-PLANCK EQUATION**
The effect of random forces on nonlinear oscillating systems p 535 A86-36710

**FORCE DISTRIBUTION**
Normal force characteristics of sharp nosed bodies of revolution at high angles of attack in subsonic and transonic flow p 527 N86-25555

**FORGING**
Using the perturbation method for determining the die forging parameters for aircraft parts p 522 A86-35997

**FOURIER TRANSFORMATION**
Evaluation of a frequency response technique for aircraft system identification
[AD-A164367] p 497 N86-25339

**FRACTURE MECHANICS**
A completely integrated system for the treatment of crack growth test data p 531 A86-34635
Constant-Load-Amplitude fatigue crack growth testing of cast aluminum alloys A201-T7 and A357-T6
[AD-A163494] p 518 N86-24821
Multiaxial and thermomechanical fatigue considerations in damage tolerant design p 526 N86-25375
Advanced quantitative methods for nondestructive evaluation p 519 N86-25376
Fracture mechanics and LCF-properties of engine discs of Ti 6Al-4V, Inconel 718 and Udimet 700 P/M-HIP p 507 N86-25378

**FRACTURE STRENGTH**
The development of a system for the study of fatigue crack growth up to 2000 Hz p 520 A86-34641

**FRAMES**
Drop testing and analysis of six-foot diameter graphite-epoxy frames p 517 A86-37068

**FUEL CONSUMPTION**
Wing aspect ratio optimization problems for transport turbojet airplanes
[SAWE PAPER 1660] p 486 A86-35206
Time navigation benefits in en route metered ATC p 482 A86-35368

**FUEL CONTROL**
Adaptive fuel control testing p 502 A86-35615

**FUEL CORROSION**
Emission FTIR analyses of thin microscopic patches of jet fuel residues deposited on heated metal surfaces
[NASA-CR-176786] p 519 N86-25502

**FUEL GAGES**
Digital correction of the readings of an aircraft fuel-measurement system p 500 A86-36725

**FUEL INJECTION**
Laser anemometer measurements of the flow from a simulated fuel nozzle p 520 A86-34410

**FUEL-AIR RATIO**
Altitude ignition/lean decel study
[AD-A163052] p 518 N86-24781

**FUSELAGES**
A skin-stringer design for a crashworthy composite fuselage for the Hughes 500E helicopter p 492 A86-35637
Unsteady transonic flow calculations for wing-fuselage configurations
[NASA-TM-87707] p 478 N86-24657
Experimental assessment of vortex retaining cavity flaps for maneuverability improvement on delta wing fighter aircraft
[AD-A164104] p 497 N86-24690
Helicopter tail rotor noise analyses
[NASA-CR-176829] p 536 N86-26163

## G

**GAS FLOW**
Laser beam duct pressure controller system
[AD-D012017] p 525 N86-24984

**GAS MIXTURES**
A transport model for flammability of premixed gases p 516 A86-36874

**GAS TURBINE ENGINES**
Laser anemometer measurements of the flow from a simulated fuel nozzle p 520 A86-34410
Intrablade velocity mapping in transonic fan passages of gas turbine p 474 A86-34411
Stress analysis of gas turbine engine structures using the boundary element method p 520 A86-34444
Practical diagnostics of aircraft gas turbines --- Russian book p 502 A86-35472
The application of LQR synthesis techniques to the turboshaft engine control problem --- Linear Quadratic Regulator p 502 A86-35614
Advanced structural casting applications for a gas turbine engine p 521 A86-35658
Application of closed-loop machining in the manufacture of gas turbines p 521 A86-35659
Vibration characteristics of aircraft engine-bladed-disk assembly p 502 A86-35865
The effect of the electrode gap geometry on current distribution during electrochemical rounding of edges p 522 A86-35980
The possibility of using ion implantation for increasing the life of the compressor blades of gas-turbine aircraft engines p 522 A86-35998
Calculation of the steady-state transverse vibrations of the system rotors-housing of a gas-turbine engine p 503 A86-36741
Altitude ignition/lean decel study
[AD-A163052] p 518 N86-24781
Life prediction and constitutive models for engine hot section anisotropic materials program
[NASA-CR-174952] p 526 N86-25003
Damage tolerance concepts for critical engine components p 506 N86-25361
Engine cyclic durability by analysis and testing: Highlights of the spring 1984 PEP Meeting p 506 N86-25362
Manufacturing technology for nondestructive evaluation (NDE) system to implement Retirement For Cause (RFC) procedures for gas turbine engine components p 507 N86-25368
AGARD Cooperative Test Progamme on titanium alloy engine disc material p 507 N86-25369
Crack growth in near-alpha titanium alloys p 526 N86-25371
Multiaxial and thermomechanical fatigue considerations in damage tolerant design p 526 N86-25375
Fracture mechanics and LCF-properties of engine discs of Ti 6Al-4V, Inconel 718 and Udimet 700 P/M-HIP p 507 N86-25378
Emission FTIR analyses of thin microscopic patches of jet fuel residues deposited on heated metal surfaces
[NASA-CR-176786] p 519 N86-25502

**GAS TURBINES**
One-piece HPTR blade squealer tip
[AD-D012003] p 504 N86-24698
An analysis of rig test disc failures p 527 N86-25381

**GEAR TEETH**
Generation of spiral bevel gears with zero kinematical errors and computer aided tooth contact analysis
[NASA-TM-87273] p 527 N86-25793

**GEARS**
Gearbox configuration analysis p 521 A86-35611
Testing of YUH-61A helicopter transmission in NASA Lewis 2240-kW (3000-hp facility
[NASA-TP-2538] p 525 N86-24992
Generation of spiral bevel gears with zero kinematical errors and computer aided tooth contact analysis
[NASA-TM-87273] p 527 N86-25793

**GEOMAGNETISM**
Computer-controlled navigation for aeromagnetic survey flights during the GANOVEX IV Antarctic expedition during the southern summer of 1984/85 p 484 A86-35293

**GIMBALS**
Theoretical three-and four-axis gimbal robot wrists
[NASA-TP-2564] p 533 N86-25168

**GLIDE PATHS**
Guidance studies for curved, descending approaches using the Microwave Landing System (MLS)
[NASA-CR-178030] p 486 N86-25335

**GLOBAL POSITIONING SYSTEM**
Commercial applications of the Navstar Global Positioning System p 514 A86-34112

**GOVERNMENT PROCUREMENT**
Cost estimating relationships for fixed wing aircraft: List price versus empty weight
[AD-A164196] p 537 N86-25300

**GOVERNMENT/INDUSTRY RELATIONS**
The field representative 'front line actioneer' --- helicopter manufacturer field service representative responsibilities p 536 A86-35645

**GRAPHITE-EPOXY COMPOSITES**
Postbuckling and crippling behavior of graphite/epoxy thin-walled airframe members p 521 A86-35643
Drop testing and analysis of six-foot diameter graphite-epoxy frames p 517 A86-37068
Compressive strength of impact damaged graphite epoxy laminates p 517 A86-37118

**GROUND EFFECT (AERODYNAMICS)**
Aircraft Noise Prediction Program theoretical manual: Propeller aerodynamics and noise
[NASA-TM-83199-PT-3] p 536 N86-25220

**GROUND SUPPORT EQUIPMENT**
Precision IMC approaches to heliports using collocated MLS --- Instrument Meteorological Conditions p 485 A86-35610

**GROUND TESTS**
Helicopter test installation RoTeSt in DNW - Application and results
[DGLR PAPER 85-113] p 513 A86-35166
Use of state estimation to calculate angle-of-attack position error from flight test data
[AD-A163962] p 480 N86-24670
Ground vibration test of an F-16 airplane with modified decoupler pylons
[NASA-TM-87634] p 496 N86-24685

**GUST ALLEVIATORS**
An application of self-tuning regulator to GLA system of an aircraft --- Gust Load Alleviation p 508 A86-34926
Helicopter gust alleviation, attitude stabilization, and vibration alleviation using individual-blade-control through a conventional swash plate p 510 A86-35604

**GUSTS**
Loads and motions of an F-106B flying through thunderstorms
[NASA-TM-87671] p 483 N86-24672

## H

**H-53 HELICOPTER**
Development of a composite tail rotor blade for the MH-53E p 493 A86-35649

**HAND (ANATOMY)**
Theoretical three-and four-axis gimbal robot wrists
[NASA-TP-2564] p 533 N86-25168

**HARMONIC CONTROL**
Higher harmonic control - Vibration reduction for reduced weight --- for helicopters
[SAWE PAPER 1679] p 489 A86-35220
Higher harmonic control - Wind tunnel demonstration of fully effective vibratory hub force suppression p 509 A86-35602

**HARRIER AIRCRAFT**
AV-8B High Angle of Attack/departure resistance system flight test program
[AIAA PAPER 86-9729] p 496 A86-37082

**HEAD-UP DISPLAYS**
Head-up display (HUD) utility. II - Runway to HUD transitions monitoring eye focus and decision times p 498 A86-33802

**HEAT EXCHANGERS**
Dual mode heat exchanger
[AD-D012156] p 524 N86-24944

**HEAT RESISTANT ALLOYS**
Thermal-mechanical fatigue behavior of nickel-base superalloys
[NASA-CR-175048] p 518 N86-24818
Life prediction and constitutive models for engine hot section anisotropic materials program
[NASA-CR-174952] p 526 N86-25003

Small defect characterization in powder metallurgy materials p 526 N86-25373
Advanced quantitative methods for nondestructive evaluation p 519 N86-25376

**HEAT TRANSFER**
Evaluation of capillary reinforced composites [NASA-CR-175061] p 517 N86-24760
Unsteady heat transfer and direct comparison to steady-state measurements in a rotor-wake experiment [NASA-TM-87220] p 524 N86-24934
Dual mode heat exchanger [AD-D012158] p 524 N86-24944

**HEAT TRANSFER COEFFICIENTS**
Investigation of heat transfer in separation regions in supersonic flow in a Laval nozzle p 477 A86-36458

**HELICOPTER CONTROL**
Flying hands off to a hover --- automatic flight control in helicopters p 507 A86-34193
Helicopter flight control with one hand p 529 A86-34923
Higher harmonic control - Vibration reduction for reduced weight --- for helicopters [SAWE PAPER 1679] p 489 A86-35220
Higher harmonic control - Wind tunnel demonstration of fully effective vibratory hub force suppression p 509 A86-35602
Helicopter gust alleviation, attitude stabilization, and vibration alleviation using individual-blade-control through a conventional swash plate p 510 A86-35604
Directional handling qualities requirements for nap of the earth (NOE) tasks p 510 A86-35622
Helicopter handling requirements based on analysis of flight maneuvers p 510 A86-35625
A comparative study of an articulated integrated side-arm controller in a variable stability helicopter p 510 A86-35626

**HELICOPTER DESIGN**
Development of the BO 105 LS p 487 A86-34920
The model 530MG - The forerunner to the ultimate light-combat helicopter [SAWE PAPER 1677] p 489 A86-35219
Sikorsky Aircraft crew station technology research helicopter [SAE PAPER 851780] p 490 A86-35442
Stored terrain data base aided pilotage for helicopters p 499 A86-35606
Gearbox configuration analysis p 521 A86-35611
The role of scale models in the design of 'low BVI noise' rotorcraft p 534 A86-35617
Flight investigation of Bell model 206 ring fin p 491 A86-35624
Free-tip-rotor wind-tunnel test results p 491 A86-35628
The design of the EH101 for safety and performance p 491 A86-35629
Influences of two landing gear designs on helicopter crashworthiness and weights p 492 A86-35632
A skin-stringer design for a crashworthy composite fuselage for the Hughes 500E helicopter p 492 A86-35637
Effects of variations in crashworthiness criteria on Sikorsky S-75 ACAP landing gear weights p 492 A86-35638
Preliminary estimate of fatigue life for dynamic components of a new helicopter p 493 A86-35639
Survey of crashworthiness achievements on Aerospatiale helicopters p 493 A86-35642
An avionics software test and evaluation technique p 499 A86-35650
The design and development of new crashworthy seats for Navy helicopters p 494 A86-35662
The Hughes integrated approach to helicopter crashworthiness Past, present, and future p 494 A86-35663
Army helicopter crashworthiness - Loading the battlefield dice in our favor p 494 A86-35664
The role of flight simulation in helicopter crew station design [SAE PAPER 851900] p 530 A86-36940
System life and reliability modeling for helicopter transmissions [NASA-CR-3967] p 525 N86-24990

**HELICOPTER ENGINES**
Procedures for the digital simulation of helicopter propulsion systems [DGLR PAPER 85-115] p 501 A86-35168
FAA certification criteria for lightning protection of helicopter digital engine control p 482 A86-35609
The application of LQR synthesis techniques to the turboshaft engine control problem --- Linear Quadratic Regulator p 502 A86-35614
Adaptive fuel control testing p 502 A86-35615

**HELICOPTER PERFORMANCE**
The health and usage monitoring of helicopter systems - The next generation p 491 A86-35613
Assessment of rotorcraft agility and manouverability with a pilot-in-the-loop simulation p 510 A86-35623
Helicopter handling requirements based on analysis of flight maneuvers p 510 A86-35625
Application of helicopter air-to-air combat test (AACT) data to current LHX concerns p 491 A86-35627
The design of the EH101 for safety and performance p 491 A86-35629
The aerodynamics of rotor blades with ice shapes accreted in hover and in level flight p 476 A86-35655
Performance degradation of helicopters due to icing - A review p 494 A86-35668

**HELICOPTER PROPELLER DRIVE**
Gearbox configuration analysis p 521 A86-35611

**HELICOPTER TAIL ROTORS**
A comparative study of tail rotor noise mechanisms p 534 A86-35618
Flight investigation of Bell model 206 ring fin p 491 A86-35624
Development of a composite tail rotor blade for the MH-53E p 493 A86-35649
Helicopter tail rotor noise analyses [NASA-CR-176829] p 536 N86-26163

**HELICOPTER WAKES**
A new approach to the free wake problem for hovering rotors p 475 A86-35633
Hovering rotor airload prediction using a full potential flow analysis with realistic wake geometry p 475 A86-35636
Helicopter tail rotor noise analyses [NASA-CR-176829] p 536 N86-26163

**HELICOPTERS**
Helicopter test installation RoTeSt in DNW - Application and results [DGLR PAPER 85-113] p 513 A86-35166
American Helicopter Society, Annual Forum, 41st, Fort Worth, TX, May 15-17, 1985, Proceedings p 473 A86-35601
Development and flight test of a helicopter, X-band, portable precision landing system concept p 485 A86-35608
FAA/HAI helicopter flight operations noise tests and initial results p 535 A86-35619
Helicopter cabin noise - Actual vs. statistical energy predictions p 491 A86-35620
Helicopter customer support - Are we aware of how great it can be p 536 A86-35644
Assessment of structural damage in composites utilizing acoustic emission technology p 521 A86-35651
Robotics in aircraft manufacturing p 522 A86-35660
Rotor performance characteristics from an aeroacoustic helicopter wind-tunnel test program [NASA-TM-87661] p 479 N86-24665
Swashplate control system [NASA-CASE-ARC-11633-1] p 511 N86-24700
Testing of YUH-61A helicopter transmission in NASA Lewis 2240-kW (3000-hp facility [NASA-TP-2538] p 525 N86-24992
A review of the pilot backache problem in the CH113 Labrador helicopter [AD-A164011] p 530 N86-25113
Helicopter rotor noise due to ingestion of atmospheric turbulence [NASA-CR-3973] p 535 N86-25216
Pilot evaluation of TCAS in the Long Ranger helicopter [FAA/PM-85/30] p 486 N86-25334
Report on interest expressed in some Australian Defence Establishment products displayed at the 1985 Paris Air Show [AD-A160807] p 498 N86-25341
Data on MI-26 helicopter p 498 N86-25602

**HELIPORTS**
Precision IMC approaches to heliports using collocated MLS --- Instrument Meteorological Conditions p 485 A86-35610

**HIGH ALTITUDE**
SHARP (Stationary High Altitude Relay Platforms) Telecommunications missions and systems p 519 A86-33943

**HIGH ASPECT RATIO**
The induced downwash and lift on a wing of high aspect ratio in unsteady motion p 474 A86-34160

**HIGH PRESSURE**
One-piece HPTR blade squealer tip [AD-D012003] p 504 N86-24698

**HIGH TEMPERATURE**
Altitude ignition/lean decel study [AD-A163052] p 518 N86-24781
Multiaxial and thermomechanical fatigue considerations in damage tolerant design p 526 N86-25375

**HOMING DEVICES**
Thermal scene generators p 522 A86-36805

**HOT CORROSION**
Na2SO4 induced corrosion of nickel at high temperature p 517 A86-37073

**HOT PRESSING**
Process development and test evaluation of cast, HIP and heat treated titanium UH-60A M.R. Damper Bracket p 516 A86-35641

**HOT-FILM ANEMOMETERS**
An experimental investigation on location of boundary layer transition on the NACA 0012 using surface hot film gages [NASA-TM-88285] p 524 N86-24936

**HOUSINGS**
Calculation of the steady-state transverse vibrations of the system rotors-housing of a gas-turbine engine p 503 A86-36741

**HOVERING**
Flying hands off to a hover --- automatic flight control in helicopters p 507 A86-34193
Directional handling qualities requirements for nap of the earth (NOE) tasks p 510 A86-35622
A new approach to the free wake problem for hovering rotors p 475 A86-35633
Hovering rotor airload prediction using a full potential flow analysis with realistic wake geometry p 475 A86-35636
The aerodynamics of rotor blades with ice shapes accreted in hover and in level flight p 476 A86-35655

**HUGHES AIRCRAFT**
A skin-stringer design for a crashworthy composite fuselage for the Hughes 500E helicopter p 492 A86-35637

**HUMAN FACTORS ENGINEERING**
Pilot error accidents - A total system approach to analysis p 481 A86-33799
Applicability of using the CAR-II model in design and evaluation of multioperator workstations with shared controls p 529 A86-33805
Cockpit automation technology - A further look p 499 A86-33814
The consideration of pilot factors in development of future collision avoidance systems [SAE PAPER 851807] p 484 A86-35437
Cockpit and cabin crew coordination and communication [SAE PAPER 851918] p 473 A86-35448
United Airlines windshear training update [SAE PAPER 851920] p 482 A86-35450
Langley aerospace test highlights, 1985 [NASA-TM-87703] p 537 N86-26276

**HYDRATION**
Materials for emergency repair of runways [AD-A164225] p 514 N86-25385

**HYDRAULIC EQUIPMENT**
Fireproof hydraulic brake system [AD-A163542] p 497 N86-24688

**HYDRAULIC FLUIDS**
Fireproof hydraulic brake system [AD-A163542] p 497 N86-24688

**HYDROMECHANICS**
F-15 digital electronic engine control system description [PAPER-3] p 504 N86-25345
Flight evaluation of a hydromechanical backup control for the digital electronic engine control system in an F100 engine [PAPER-9] p 505 N86-25351

**HYPERSONIC AIRCRAFT**
Can we develop the 1.5 million pound aerospace plane? p 515 A86-34195
Selections from Flug Revue und Flugwelt International. A. On the border of Time-hypersonic flight. B. NASA programs pave the way for the hypersonic aircraft. C. Shuttle flight 61-B; construction in space. D. Faster than a bullet; hypersonic military aircraft [NASA-TM-88418] p 474 N86-24652

**HYPERSONIC FLIGHT**
Selections from Flug Revue und Flugwelt International. A. On the border of Time-hypersonic flight. B. NASA programs pave the way for the hypersonic aircraft. C. Shuttle flight 61-B; construction in space. D. Faster than a bullet; hypersonic military aircraft [NASA-TM-88418] p 474 N86-24652

**HYPERSONIC FLOW**
Hypersonic flow around a wing at large angles of attack with detached compression jump p 480 N86-25534

**HYPERSONIC SPEED**
Flow around delta wings with broken-line leading edges p 481 N86-25560

**I**

**ICE FORMATION**
The aerodynamics of rotor blades with ice shapes accreted in hover and in level flight p 476 A86-35655
The performance characteristics of simulated ice on rotorcraft airfoils p 482 A86-35656

Performance degradation of helicopters due to icing - A review p 494 A86-35666

In-flight measurements of wing ice shapes and wing section drag increases caused by natural icing conditions
[NASA-TM-87301] p 479 N86-24667

Ice detector
[NASA-CASE-LAR-13403-1] p 483 N86-24673

Evaluation of capillary reinforced composites
[NASA-CR-175061] p 517 N86-24760

An assessment of data quality and quantity from airborne cloud physics projects from 1974 through 1984
[DOT/FAA/CT-85/37] p 526 N86-25079

**ICE NUCLEI**
In-flight measurements of wing ice shapes and wing section drag increases caused by natural icing conditions
[NASA-TM-87301] p 479 N86-24667

**ICE PREVENTION**
VSTOL aircraft ice protection design considerations
p 493 A86-35654

**IGNITION LIMITS**
Altitude ignition/lean decel study
[AD-A163052] p 518 N86-24781

**IMAGING TECHNIQUES**
Thermal scene generators p 522 A86-36805

**IMPACT DAMAGE**
Drop testing and analysis of six-foot diameter graphite-epoxy frames p 517 A86-37068

Compressive strength of impact damaged graphite epoxy laminates p 517 A86-37118

KRASH dynamics analysis modeling: Transport airplane controlled impact demonstration test
[DOT/FAA/CT-85/9-REV] p 483 N86-25331

**IMPACT TESTS**
Crash response data system for the controlled impact demonstration (CID) of a full-scale transport aircraft
p 500 A86-37045

**IN-FLIGHT MONITORING**
Head-up display (HUD) utility. II - Runway to HUD transitions monitoring eye focus and decision times
p 498 A86-33802

Pilot Executive project - PILEX — flight status monitor expert system
[SAE PAPER 851806] p 489 A86-35436

In flight access to minimum vectoring altitudes - A pilot's perspective
[SAE PAPER 851837] p 485 A86-35444

Real-time flight test PCM data acquisition monitor
[AD-A164035] p 524 N86-24897

**INCOMPRESSIBLE FLOW**
Calculation of the aerodynamic characteristics of three-dimensional wings of finite span in a potential incompressible flow p 476 A86-35985

**INERTIAL PLATFORMS**
LMR-83 - Inertial measurement unit for flight regulation and navigation
[DGLR PAPER 85-132] p 508 A86-35177

**INFINITE SPAN WINGS**
ALESEP. Part 2: A computer program for the analysis of leading edge separation bubbles on infinite swept wings
[NASA-CR-178015] p 479 N86-24664

**INFLATABLE STRUCTURES**
A review of the pilot backache problem in the CH113 Labrador helicopter
[AD-A164011] p 530 N86-25113

**INFRARED IMAGERY**
Thermal scene generators p 522 A86-36805

**INFRARED SPECTROSCOPY**
Materials for emergency repair of runways
[AD-A164225] p 514 N86-25385

**INJECTION MOLDING**
Frameless transparencies for aircraft cockpit enclosures
[AD-D012155] p 497 N86-24689

**INJECTORS**
Altitude ignition/lean decel study
[AD-A163052] p 518 N86-24781

**INLET FLOW**
A numerical analysis applied to high angle of attack three-dimensional inlets
[NASA-TM-87298] p 478 N86-24658

Review and evaluation of recent developments in melic inlet dynamic flow distortion prediction and computer program documentation and user's manual estimating maximum instantaneous inlet flow distortion from steady-state total pressure measurements with full, limited, or no dynamic data
[NASA-CR-176765] p 525 N86-24955

Digital electronic engine control history
[PAPER-2] p 504 N86-25344

Effects of inlet distortion on a static pressure probe mounted on the engine hub in an F-15 airplane
[PAPER-5] p 505 N86-25347

**INSPECTION**
Limitations of manual NDT systems and the No Eyes concept p 506 N86-25365

**INSTRUMENT COMPENSATION**
Digital correction of the readings of an aircraft fuel-measurement system p 500 A86-36725

**INSTRUMENT ERRORS**
Studies on turning errors of the magnetic compass in flight experiments p 499 A86-34276

Digital correction of the readings of an aircraft fuel-measurement system p 500 A86-36725

**INSTRUMENT FLIGHT RULES**
Precision IMC approaches to heliports using collocated MLS — Instrument Meteorological Conditions
p 485 A86-35610

Aircraft accident/incident summary reports: Denver, Colorado, August 19, 1983; Blountville, Tennessee, July 16, 1983; Tucson, Arizona, February 6, 1983, Cockeysville, Maryland, April 28, 1984; Akron, Ohio, September 30, 1984; Seattle, Washington, October 18, 1984; Miami, Florida, November 11, 1983
[I-B85-910409] p 483 N86-24675

**INTAKE SYSTEMS**
Evaluation of capillary reinforced composites
[NASA-CR-175061] p 517 N86-24760

**INTERACTIONAL AERODYNAMICS**
The superposition distortion index — in axial flow fans of turbofan engines p 500 A86-34279

A comparative study of tail rotor noise mechanisms
p 534 A86-35618

Model helicopter blade slap at low tip speeds - Theoretical and experimental correlations
p 535 A86-35621

Hovering rotor airload prediction using a full potential flow analysis with realistic wake geometry
p 475 A86-35636

ALESEP. Part 2: A computer program for the analysis of leading edge separation bubbles on infinite swept wings
[NASA-CR-178015] p 479 N86-24664

**INTERACTIVE CONTROL**
Pilot vehicle interfaces with smart avionics systems
[SAE PAPER 851923] p 529 A86-35432

Pilot Executive project - PILEX — flight status monitor expert system
[SAE PAPER 851806] p 489 A86-35436

Computer-aided cockpit workload analysis for all weather, multirole tactical aircraft
[SAE PAPER 851876] p 499 A86-35439

**INTERFACES**
Real-time flight test PCM data acquisition monitor
[AD-A164035] p 524 N86-24897

**INTERFERENCE DRAG**
Characteristics of the interaction of interference and diffraction flows at supersonic velocities
p 478 A86-36459

**INTERNAL COMPRESSION INLETS**
Low-speed performance of an axisymmetric, mixed-compression, supersonic inlet with auxiliary inlets
[NASA-TP-2557] p 503 N86-24694

**INTERPOLATION**
Comparison of absorption and radiation boundary conditions using a time-domain three-dimensional finite difference electromagnetic computer code
[AD-A163828] p 532 N86-25140

**INVARIANCE**
Eigenstructure assignment: A tutorial - I theory — for linear time invariant systems p 531 A86-35358

**INVESTIGATION**
An experimental investigation of reducing advanced turboprop cabin noise by wing shielding
[NASA-TM-87112] p 536 N86-25218

**INVESTMENT CASTING**
Process development and test evaluation of cast, HIP and heat treated titanium UH-60A M.R. Damper Bracket
p 516 A86-35641

Advanced structural casting applications for a gas turbine engine p 521 A86-35658

**INVISCID FLOW**
Inviscid vortex-stretched turbulent shear-layer flow computed around a cranked delta wing
p 475 A86-35253

ALESEP. Part 2: A computer program for the analysis of leading edge separation bubbles on infinite swept wings
[NASA-CR-178015] p 479 N86-24664

**ION IMPLANTATION**
The possibility of using ion implantation for increasing the life of the compressor blades of gas-turbine aircraft engines p 522 A86-35998

## J

**JET AIRCRAFT**
An LQG up-and away flight control design for the STOL F-15 aircraft
[AD-A164108] p 512 N86-24707

An LQG up-and away flight control design for the STOL F-15 aircraft
[AD-A164108] p 512 N86-25384

**JET AIRCRAFT NOISE**
Flow field and near and far sound field of a subsonic jet p 476 A86-35855

Comparison of advanced turboprop and conventional jet and propeller aircraft flyover noise annoyance - Preliminary results p 528 A86-37059

**JET ENGINE FUELS**
Backup control airstart performance on a digital electronic engine control-equipped F100-engine
[PAPER-10] p 505 N86-25352

**JET ENGINES**
Fatigue failure of jet engine drive shafts
p 500 A86-33970

Simulation and measurement of engine influences in a two-jet aircraft model using model engines
[DGLR PAPER 85-092] p 513 A86-35155

Front-line power p 503 A86-37096

Evaluation of capillary reinforced composites
[NASA-CR-175061] p 517 N86-24760

**JET THRUST**
Real-time in-flight thrust calculation on a digital electronic engine control-equipped F100 engine in an F-15 airplane
[PAPER-13] p 506 N86-25355

## K

**KALMAN FILTERS**
Adaptive flutter suppression in the presence of turbulence p 508 A86-35370

Use of state estimation to calculate angle-of-attack position error from flight test data
[AD-A163862] p 480 N86-24670

An LQG up-and away flight control design for the STOL F-15 aircraft
[AD-A164108] p 512 N86-24707

LQG/LTR design of a robust flight controller for the STOL F-15
[AD-A164111] p 512 N86-24708

An LQG up-and away flight control design for the STOL F-15 aircraft
[AD-A164108] p 512 N86-25384

**KAMAN AIRCRAFT**
Combining analysis and test for rotor blade development p 493 A86-35648

## L

**LAMINAR BOUNDARY LAYER**
Group studies of equations of the laminar boundary layer on a rotating wing p 476 A86-35994

**LAMINAR FLOW**
Advanced boundary layer transition measurement methods for flight applications
[AIAA PAPER 86-9786] p 500 A86-37083

Natural laminar flow flight experiments on a swept wing business jet-boundary layer stability analyses
[NASA-CR-3975] p 478 N86-24659

**LAMINATES**
ARALL (Aramid Reinforced Aluminium Laminates). - A hybrid composite with a great resistance against fatigue crack propagation
[DGLR PAPER 85-137] p 515 A86-35180

Compressive strength of impact damaged graphite epoxy laminates p 517 A86-37118

**LANDING AIDS**
New developments in antennas of classical radio navigational and landing sytems p 484 A86-33741

Development and flight test of a helicopter, X-band, portable precision landing system concept
p 485 A86-35608

Computed centerline MLS (Microwave Landing System) approach demonstration at Washington National Airport
[AD-A163722] p 486 N86-24681

**LANDING GEAR**
Influences of two landing gear designs on helicopter crashworthiness and weights p 492 A86-35632

Effects of variations in crashworthiness criteria on Sikorsky S-75 ACAP landing gear weights
p 492 A86-35638

Fireproof hydraulic brake system
[AD-A163542] p 497 N86-24688

**LANDING SIMULATION**
Multivariable output control law design for the STOL (Short Takeoff and Landing) F-15 in landing configuration
[AD-A164516] p 496 N86-25340
**LARGE SPACE STRUCTURES**
Tine domain design of robust controllers for LQG (Linear Quadratic Gaussian): application to large space structures
[AD-A163635] p 533 N86-26074
**LASER ANEMOMETERS**
International Symposium on Laser Anemometry, 2nd, Miami Beach, FL, November 17-22, 1985, Proceedings
p 519 A86-34407
Laser anemometer measurements of the flow from a simulated fuel nozzle p 520 A86-34410
**LASER APPLICATIONS**
The development of laser speckle velocimetry for the measurement of vortical flow fields
[AIAA PAPER 86-0768] p 523 A86-37091
**LASER DOPPLER VELOCIMETERS**
International Symposium on Laser Anemometry, 2nd, Miami Beach, FL, November 17-22, 1985, Proceedings
p 519 A86-34407
Intrablade velocity mapping in transonic fan passages of gas turbine p 474 A86-34411
**LASER OUTPUTS**
Laser beam duct pressure controller system
[AD-D012017] p 525 N86-24984
**LATERAL CONTROL**
Swashplate control system
[NASA-CASE-ARC-11633-1] p 511 N86-24700
**LATERAL STABILITY**
Simulation problem of controlling lateral movement of aircraft during landing approach p 534 N86-26160
**LATTICES (MATHEMATICS)**
A vortex lattice method for calculating nonlinear aerodynamic characteristics of interfering airfoils
[DGLR PAPER 85-122] p 475 A86-35172
**LAVAL NUMBER**
Investigation of heat transfer in separation regions in supersonic flow in a Laval nozzle p 477 A86-36458
**LEADING EDGE FLAPS**
The behaviour and performance of leading edge vortex flaps
[CAR-8601] p 479 N86-24666
Experimental assessment of vortex retaining cavity flaps for maneuverability improvement on delta wing fighter aircraft
[AD-A164104] p 497 N86-24690
**LEADING EDGE SWEEP**
Flow around delta wings with broken-line leading edges p 481 N86-25560
**LEADING EDGES**
ALESEP. Part 2: A computer program for the analysis of leading edge separation bubbles on infinite swept wings
[NASA-CR-178015] p 479 N86-24664
Investigation of rolling-up and interaction of leading-edge and trailing-edge vortex sheets on a slender delta wing
[AD-A163692] p 479 N86-24668
Experimental study of apex fences for lift enhancement on a highly swept delta wing configuration
[AD-A163877] p 512 N86-24705
**LEGENDRE FUNCTIONS**
Optimal control of deterministic systems via shifted Legendre polynomials p 530 A86-34140
**LIBRARIES**
Development and evaluation of math library routines for a 1750A airborne microcomputer
[AD-A164050] p 533 N86-26030
**LIFE (DURABILITY)**
System life and reliability modeling for helicopter transmissions
[NASA-CR-3967] p 525 N86-24990
**LIFE SUPPORT SYSTEMS**
Report on interest expressed in some Australian Defence Establishment products displayed at the 1985 Paris Air Show
[AD-A160807] p 498 N86-25341
**LIFT**
The induced downwash and lift on a wing of high aspect ratio in unsteady motion p 474 A86-34160
Nonlinear lift control at high speed and high angle of attack using vortex flow technology p 478 A86-37050
Increments in aerofoil maximum lift coefficient due to deployment of various high-lift devices
[ESDU-85033] p 480 N86-25325
**LIFT AUGMENTATION**
Experimental study of apex fences for lift enhancement on a highly swept delta wing configuration
[AD-A163877] p 512 N86-24705
**LIFT DRAG RATIO**
The behaviour and performance of leading edge vortex flaps
[CAR-8601] p 479 N86-24666
Experimental assessment of vortex retaining cavity flaps for maneuverability improvement on delta wing fighter aircraft
[AD-A164104] p 497 N86-24690
Experimental study of apex fences for lift enhancement on a highly swept delta wing configuration
[AD-A163877] p 512 N86-24705
Transonic airfoil analysis and design in nonuniform flow
[NASA-CR-3991] p 480 N86-25328
**LIFTING BODIES**
The method of fundamental solutions in aerodynamics. II Applications to the theory of lifting surfaces in supersonic flow p 477 A86-36285
**LIGHT AIRCRAFT**
Application of helicopter air-to-air combat test (AACT) data to current LHX concerns p 491 A86-35627
A computer controlled autopilot and an annunciation system for light aircraft p 511 A86-36871
**LIGHTING EQUIPMENT**
Aircraft lighting systems p 491 A86-35607
**LIGHTNING**
Comperison of absorption and radiation boundary conditions using a time-domain three-dimensional finite difference electromagnetic computer code
[AD-A163828] p 532 N86-25149
**LIGHTNING SUPPRESSION**
FAA certification criteria for lightning protection of helicopter digital engine control p 482 A86-35609
**LIKELIHOOD RATIO**
The evaluation of the OSGLR algorithm for restructurable controls
[NASA-CR-178083] p 485 N86-24678
**LINEAR FILTERS**
New linear tracking filters --- for modeling target maneuvering aircraft motion p 506 A86-35342
**LINEAR SYSTEMS**
Eigenstructure assignment: A tutorial - I theory --- for linear time invariant systems p 531 A86-35358
Time domain control design for robust stability of linear regulators - Application to aircraft control
p 508 A86-35383
Natural laminar flow flight experiments on a swept wing business jet-boundary layer stability analyses
[NASA-CR-3975] p 478 N86-24659
An LQG up-and away flight control design for the STOL F-15 aircraft
[AD-A164108] p 512 N86-24707
LQG/LTR design of a robust flight controller for the STOL F-15
[AD-A164111] p 512 N86-24708
An LQG up-and away flight control design for the STOL F-15 aircraft
[AD-A164108] p 512 N86-25384
**LINKAGES**
On the methodology of an interactive computer-aided optimal design of a dual-valve linkage
p 523 A86-36887
**LIQUID COOLING**
Dual mode heat exchanger
[AD-D012156] p 524 N86-24944
**LIQUID CRYSTALS**
Aramid fiber composites for general engineering
p 517 A86-37137
**LISTS**
Cost estimating relationships for fixed wing aircraft: List price versus empty weight
[AD-A164196] p 537 N86-25300
**LOADING MOMENTS**
TURBISTAN: A standard load sequence for aircraft engine discs p 526 N86-25380
**LOADS (FORCES)**
A research program in active control/aeroelasticity
[NASA-CR-176773] p 511 N86-24702
A review of the pilot backache problem in the CH113 Labrador helicopter
[AD-A164011] p 530 N86-25113
**LOCKHEED AIRCRAFT**
Stealth comes stealthily p 495 A86-36334
**LOGIC DESIGN**
F-15 digital electronic engine control system description
[PAPER-3] p 504 N86-25345
NASA Lewis F100 engine testing
[PAPER-4] p 504 N86-25346
Airstart performance of a digital electronic engine control system on an F100 engine
[PAPER-8] p 505 N86-25350
**LOGISTICS MANAGEMENT**
Spare parts pricing - Impact on logistics support
p 537 A86-35647
**LONGITUDINAL CONTROL**
Swashplate control system
[NASA-CASE-ARC-11633-1] p 511 N86-24700
**LOOPS**
LQG/LTR design of a robust flight controller for the STOL F-15
[AD-A164111] p 512 N86-24708
**LOW ALTITUDE**
SHARP (Stationary High Altitude Relay Platform) - Rectenna and low altitude tests p 519 A86-33944
**LOW ASPECT RATIO WINGS**
Flutter analysis of low aspect ratio wings
p 527 N86-25838
**LOW COST**
Too little time - Too little money --- low cost flight simulation facility
[SAE PAPER 851904] p 532 A86-36943
**LOW NOISE**
The role of scale models in the design of 'low BVI noise' rotorcraft p 534 A86-35617
**LOW SPEED**
Low-speed performance of an axisymmetric, mixed-compression, supersonic inlet with auxiliary inlets
[NASA-TP-2557] p 503 N86-24694

**M**

**MACH NUMBER**
Use of state estimation to calculate angle-of-attack position error from flight test data
[AD-A163962] p 480 N86-24670
Conversion of air-data system pressure errors into height and speed corrections
[ESDU-85036] p 497 N86-25338
**MAGNETIC COMPASSES**
Studies on turning errors of the magnetic compass in flight experiments p 499 A86-34276
**MAGNETIC SURVEYS**
Computer-controlled navigation for aeromagnetic survey flights during the GANOVEX IV Antarctic expedition during the southern summer of 1984/85 p 484 A86-35293
**MAINTENANCE**
Materials for emergency repair of runways
[AD-A164225] p 514 N86-25385
Data on MI-26 helicopter p 498 N86-25602
**MALFUNCTIONS**
An application of adaptive learning to malfunction recovery
[NASA-CR-166620] p 533 N86-25169
Flight evaluation of a hydromechanical backup control for the digital electronic engine control system in an F100 engine
[PAPER-9] p 505 N86-25351
**MAN MACHINE SYSTEMS**
Helicopter flight control with one hand
p 529 A86-34923
A preliminary study of the basic display/guidance requirements for flying near optimal trajectories
p 499 A86-35366
Cockpit automation - Design and implementation issues
[SAE PAPER 851921] p 529 A86-35431
Pilot vehicle interfaces with smart avionics systems
[SAE PAPER 851923] p 529 A86-35432
Computer-aided cockpit workload analysis for all weather, multirole tactical aircraft
[SAE PAPER 851876] p 499 A86-35439
Pilot interface with fly-by-wire control systems
[SAE PAPER 851836] p 509 A86-35443
The use of ellipsoidal solids to display human body dynamic response p 530 A86-36852
Simulation of aircraft seat response to a crash environment p 530 A86-36879
**MANAGEMENT METHODS**
Application of artificial intelligence to improve aircraft survivability
[AD-A164172] p 483 N86-24674
**MANAGEMENT PLANNING**
Digital electronic engine control history
[PAPER-2] p 504 N86-25344
**MANAGEMENT SYSTEMS**
Simulation of time-control procedures for terminal area flow management p 484 A86-35369
**MANEUVERABILITY**
Assessment of rotorcraft agility and maneuverability with a pilot-in-the-loop simulation p 510 A86-35623
Application of helicopter air-to-air combat test (AACT) data to current LHX concerns p 491 A86-35627
Experimental assessment of vortex retaining cavity flaps for maneuverability improvement on delta wing fighter aircraft
[AD-A164104] p 497 N86-24690
**MANIPULATORS**
Theoretical three-and four-axis gimbal robot wrists
[NASA-TP-2564] p 533 N86-25168
**MANUAL CONTROL**
Helicopter flight control with one hand
p 529 A86-34923

**MANUFACTURING**
Robotics in aircraft manufacturing p 522 A86-35660
**MARKETING**
Optimization of seaplanes [DGLR PAPER 85-170] p 488 A86-35189
Helicopter customer support - Are we aware of how great it can be p 536 A86-35644
Cost estimating relationships for fixed wing aircraft: List price versus empty weight [AD-A164196] p 537 N86-25300
**MATERIALS HANDLING**
AN-124 airplane's cargo-handling and automation equipment p 527 N86-25600
Data on MI-26 helicopter p 498 N86-25602
**MATERIALS SCIENCE**
Advanced composites - The structural revolution p 517 A86-37136
**MATHEMATICAL MODELS**
The behaviour and performance of leading edge vortex flaps [CAR-8601] p 479 N86-24666
Simulation problem of controlling lateral movement of aircraft during landing approach p 534 N86-26160
**MATRIX MATERIALS**
Effect of fiber and matrix maximum strain on the energy absorption of composite materials p 516 A86-35640
**MEASURING INSTRUMENTS**
Crash response data system for the controlled impact demonstration (CID) of a full-scale transport aircraft p 500 A86-37045
Report on interest expressed in some Australian Defence Establishment products displayed at the 1985 Paris Air Show [AD-A160807] p 498 N86-25341
**MECHANICAL PROPERTIES**
Comparison of Al alloys and carbon fiber composite materials in aircraft construction [DGLR PAPER 85-136] p 515 A86-35179
**METAL FATIGUE**
Some aspects of variability in fatigue crack initiation and propagation in thick aluminium alloy sections p 522 A86-36176
**METAL MATRIX COMPOSITES**
ARALL (Aramid Reinforced Aluminium Laminates), - A hybrid composite with a great resistance against fatigue crack propagation [DGLR PAPER 85-137] p 515 A86-35180
**METEOROLOGICAL PARAMETERS**
An intercomparison of turbulence data obtained by two aircraft during KonTur p 528 A86-36308
**METEOROLOGICAL RESEARCH AIRCRAFT**
An intercomparison of turbulence data obtained by two aircraft during KonTur p 528 A86-36308
**METEOROLOGICAL SERVICES**
Precision IMC approaches to heliports using collocated MLS --- Instrument Meteorological Conditions p 485 A86-35610
**MICROPROCESSORS**
Real-time flight test PCM data acquisition monitor [AD-A164035] p 524 N86-24897
**MICROSTRUCTURE**
Some characteristics of structure formation in forged semifinished products of V93pch aluminum alloy p 522 A86-35999
**MICROWAVE EQUIPMENT**
First tests of an onboard MLS receiver p 484 A86-33988
**MICROWAVE LANDING SYSTEMS**
First tests of an onboard MLS receiver p 484 A86-33988
Precision IMC approaches to heliports using collocated MLS --- Instrument Meteorological Conditions p 485 A86-35610
Computed centerline MLS (Microwave Landing System) approach demonstration at Washington National Airport [AD-A163722] p 486 N86-24681
Guidance studies for curved, descending approaches using the Microwave Landing System (MLS) [NASA-CR-178030] p 486 N86-25335
**MICROWAVE RADIOMETERS**

Digital correction of the readings of an aircraft fuel-measurement system p 500 A86-36725

An engineering approach to the use of expert systems technology in avionics applications [NASA-TM-88263] p 497 N86-24687

Real-time in-flight thrust calculation on a digital electronic engine control-equipped F100 engine in an F-15 airplane [PAPER-13] p 506 N86-25355

**ONE DIMENSIONAL FLOW**

Propulsion and Energetics Panel Working Group 14 on suitable averaging techniques in non-uniform internal flows [AD-A133968] p 503 N86-24692

**OPERATING COSTS**

Application of digital/electric systems to advanced technology aircraft [SAWE PAPER 1639] p 488 A86-35203

**OPERATOR PERFORMANCE**

Applicability of using the CAR-II model in design and evaluation of multioperator workstations with shared controls p 529 A86-33805

**OPTIMAL CONTROL**

On the vertical turns sustaining corner velocity --- optimal control in aircraft minimum time pull-ups from dives p 507 A86-33979

Optimal control of deterministic systems via shifted Legendre polynomials p 530 A86-34140

Locally optimal control in systems with delay --- for flight vehicle stabilization p 510 A86-35984

Application of the Optimal Control Model to the design of flight simulation experiments [SAE PAPER 851903] p 532 A86-36942

**OPTIMIZATION**

Details on the optimization of cruising drag of the Airbus A320 [DGLR PAPER 85-089] p 487 A86-35152

Comparative investigation of optimization procedures in aircraft preliminary design [DGLR PAPER 85-119] p 487 A86-35170

Optimization of seaplanes [DGLR PAPER 85-170] p 488 A86-35189

An optimization procedure for a redundant wing structure [SAWE PAPER 1684] p 521 A86-35225

Optimization in design processes - An informatics point of view p 531 A86-36208

A research program in active control/aeroelasticity [NASA-CR-176773] p 511 N86-24702

Transonic airfoil analysis and design in nonuniform flow [NASA-CR-3991] p 480 N86-25328

Role of optimization methods in improvement of flight control for airplanes p 513 N86-25603

Experiences with NASTRAN in a multidisciplinary optimization environment p 527 N86-25831

Parametric optimization of algorithm for estimating values of one class of unsteady random processes p 534 N86-26161

**ORBIT TRANSFER VEHICLES**

Weights assessment for orbit-on-demand vehicles [SAWE PAPER 1674] p 515 A86-35217

**ORBITAL LAUNCHING**

Weights assessment for orbit-on-demand vehicles [SAWE PAPER 1674] p 515 A86-35217

**ORTHOPEDICS**

A review of the pilot backache problem in the CH113 Labrador helicopter [AD-A164011] p 530 N86-25113

**OXYGEN TENSION**

Na2SO4 induced corrosion of nickel at high temperature p 517 A86-37073

### P

**PAIN**

A review of the pilot backache problem in the CH113 Labrador helicopter [AD-A164011] p 530 N86-25113

**PANEL METHOD (FLUID DYNAMICS)**

A numerical analysis applied to high angle of attack three-dimensional inlets [NASA-TM-87298] p 478 N86-24658

**PANELS**

The effect of center delamination on the instability of composite cylindrical panels p 520 A86-34642

**PARACHUTES**

Report on interest expressed in some Australian Defence Establishment products displayed at the 1985 Paris Air Show [AD-A160807] p 498 N86-25341

**PARAMETER IDENTIFICATION**

Estimation of transport airplane aerodynamics using multiple stepwise regression p 489 A86-35383

Evaluation of a frequency response technique for aircraft system identification [AD-A164367] p 497 N86-25339

Parametric optimization of algorithm for estimating values of one class of unsteady random processes p 534 N86-26161

**PASSENGER AIRCRAFT**

Starship I - A weight control challenge --- for next generation business aircraft [SAWE PAPER 1682] p 489 A86-35223

**PASSENGERS**

Aircraft accident report: Air Canada flight 797, McDonnell Douglas DC-9-32, C-FTLU, Greater Cincinnati International Airport, Covington, Kentucky, June 2, 1983 [PB86-910402] p 483 N86-25332

**PAYLOADS**

Weights assessment for orbit-on-demand vehicles [SAWE PAPER 1674] p 515 A86-35217

**PERFORMANCE PREDICTION**

The performance characteristics of simulated ice on rotorcraft airfoils p 482 A86-35656

Propulsion and Energetics Panel Working Group 14 on suitable averaging techniques in non-uniform internal flows [AD-A133968] p 503 N86-24692

Increments in aerofoil maximum lift coefficient due to deployment of various high-lift devices [ESDU-85033] p 480 N86-25325

**PERFORMANCE TESTS**

First tests of an onboard MLS receiver p 484 A86-33988

An avionics software test and evaluation technique p 499 A86-35650

**PERTURBATION THEORY**

Calculation of the dynamic response of a flight vehicle using a discrete-continuous model p 476 A86-35979

Using the perturbation method for determining the die forging parameters for aircraft parts p 522 A86-35997

**PHOTOGRAMMETRY**

Photogrammetry as a means of mapping postbuckled composite surfaces p 520 A86-34639

**PILOT ERROR**

Pilot error accidents - A total system approach to analysis p 481 A86-33799

Helicopter flight control with one hand p 529 A86-34923

Use of state estimation to calculate angle-of-attack position error from flight test data
[AD-A163962] p 480 N86-24670

**PILOT PERFORMANCE**
Cockpit automation - Design and implementation issues
[SAE PAPER 851921] p 529 A86-35431
Pilot vehicle interfaces with smart avionics systems
[SAE PAPER 851923] p 529 A86-35432
Pilot Executive project - PILEX --- flight status monitor expert system
[SAE PAPER 851806] p 469 A86-35436
The consideration of pilot factors in development of future collision avoidance systems
[SAE PAPER 851807] p 484 A86-35437
Computer-aided cockpit workload analysis for all weather, multirole tactical aircraft
[SAE PAPER 851876] p 499 A86-35439
Pilot interface with fly-by-wire control systems
[SAE PAPER 851836] p 509 A86-35443
In flight access to minimum vectoring altitudes - A pilot's perspective
[SAE PAPER 851837] p 465 A86-35444
An integrated display for vertical and translational flight
Eight factors affecting pilot performance
p 529 A86-38175
Loads and motions of an F-106B flying through thunderstorms
[NASA-TM-87671] p 483 N86-24672

**PILOT TRAINING**
Development of an authoritative aid to wind shear training
[SAE PAPER 851919] p 482 A86-35449
United Airlines windshear training update
[SAE PAPER 851920] p 482 A86-35450
Capabilities of airborne and ground based flight simulation
[SAE PAPER 851944] p 513 A86-36944

**PIPELINING (COMPUTERS)**
The possibility of achieving high productivity with vector-pipeline processors in solving problems of mathematical physics p 531 A86-36574

**PITCH (INCLINATION)**
Use of state estimation to calculate angle-of-attack position error from flight test data
[AD-A163962] p 480 N86-24670
Swashplate control system
[NASA-CASE-ARC-11633-1] p 511 N86-24700
An empirical study of flight control software reliability
[NASA-CR-178058] p 532 N86-25145
Pitch-location effects on dynamic stall
[AD-A164322] p 480 N86-25329

**PITCHING MOMENTS**
Experimental assessment of vortex retaining cavity flaps for maneuverability improvement on delta wing fighter aircraft
[AD-A164104] p 497 N86-24690

**PLASTIC AIRCRAFT STRUCTURES**
A skin-stringer design for a crashworthy composite fuselage for the Hughes 500E helicopter
p 492 A86-35637
Frameless transparencies for aircraft cockpit enclosures
[AD-D012155] p 497 N86-24689

**PNEUMATIC CONTROL**
Transient model of a pneumatic ejector - Application to the simulation of aircraft bleed air temperature control systems p 489 A86-35405

**POLYAMIDE RESINS**
ARALL (Aramid Reinforced Aluminium Laminates), - A hybrid composite with a great resistance against fatigue crack propagation
[DGLR PAPER 85-137] p 515 A86-35180

**POLYMER PHYSICS**
Aramid fiber composites for general engineering
p 517 A86-37137

**POLYMERS**
An internal variable assisted formulation of moisture sorption models for polymers and composites
p 515 A86-34650

**POROUS PLATES**
Supersonic flow around blunt perforated shields
p 480 N86-25558

**POSITION (LOCATION)**
Use of state estimation to calculate angle-of-attack position error from flight test data
[AD-A163962] p 480 N86-24670
Pitch-location effects on dynamic stall
[AD-A164322] p 480 N86-25329

**POTENTIAL FLOW**
A comparison of solutions of the complete potential equation and the Euler equations for the transonic flow around the DFVLR-F4-wing
[DGLR PAPER 85-121] p 475 A86-35171
Hovering rotor airload prediction using a full potential flow analysis with realistic wake geometry
p 475 A86-35636
A numerical analysis applied to high angle of attack three-dimensional inlets
[NASA-TM-87298] p 478 N86-24658

**POWDER METALLURGY**
Small defect characterization in powder metallurgy materials p 526 N86-25373

**PREDICTION ANALYSIS TECHNIQUES**
The development of an advanced weight estimation technique for aircraft conceptual design
[SAWE PAPER 1645] p 531 A86-35204
A weight method for structual boxes
[SAWE PAPER 1680] p 521 A86-35221
Helicopter cabin noise - Actual vs. statistical energy predictions p 491 A86-35620
Life prediction and constitutive models for engine hot section anisotropic materials program
[NASA-CR-174952] p 526 N86-25003

**PREDICTIONS**
Altitude ignition/lean decel study
[AD-A163052] p 518 N86-24781
Data sources for parameters used in predictive modeling of fire growth and smoke spread
[PB86-130986] p 518 N86-24786
KRASH dynamics analysis modeling: Transport airplane controlled impact demonstration test
[DOT/FAA/CT-85/9-REV] p 483 N86-25331

**PREMIXED FLAMES**
A transport model for flammability of premixed gases
p 516 A86-36874

**PRESSURE DISTRIBUTION**
Laser beam duct pressure controller system
[AD-D012017] p 525 N86-24984
Pitch-location effects on dynamic stall
[AD-A164322] p 480 N86-25329

**PRESSURE EFFECTS**
Conversion of air-data system pressure errors into height and speed corrections
[ESDU-85035] p 497 N86-25338

**PRESSURE REDUCTION**
Backup control airstart performance on a digital electronic engine control-equipped F100-engine
[PAPER-10] p 505 N86-25352

**PRESSURE REGULATORS**
Laser beam duct pressure controller system
[AD-D012017] p 525 N86-24984

**PROBLEM SOLVING**
Information on new AN-124 giant cargo plane
p 498 N86-25601

**PRODUCT DEVELOPMENT**
Sikorsky Aircraft crew station technology research helicopter
[SAE PAPER 851780] p 490 A86-35442
The material development, component manufacture and post-service evaluation of RB 211-524 cowl doors utilising carbon fibre composite materials p 523 A86-37106

**PROGRAMMING LANGUAGES**
Using Ada in the real-time avionics environment issues and conclusions
[AD-A163844] p 533 N86-25151

**PROP-FAN TECHNOLOGY**
The prop-fan - Initiation for a new generation of propulsion systems
[DGLR PAPER 85-166] p 501 A86-35188
Evaluation of propfan propulsion applied to general aviation
[NASA-CR-175020] p 503 N86-24695

**PROPELLER EFFICIENCY**
Evaluation of propfan propulsion applied to general aviation
[NASA-CR-175020] p 503 N86-24695
An experimental investigation of reducing advanced turboprop cabin noise by wing shielding
[NASA-TM-87112] p 536 N86-25218

**PROPELLER FANS**
Weakly nonlinear acoustic and shock-wave theory of the noise of advanced high-speed turbopropellers
p 534 A86-35146

**PROPELLER SLIPSTREAMS**
Experimental study of the effects of installation on singleand counter-rotation propeller noise
[NASA-TP-2541] p 536 N86-26102

**PROPELLERS**
Measurements regarding the emission angle dependence of propeller-acoustic pressure/time signals, taking into account passing flight conditions
[DGLR PAPER 85-112] p 534 A86-35165
Comparison of advanced turboprop and conventional jet and propeller aircraft flyover noise annoyance - Preliminary results p 528 A86-37059

**PROPULSION SYSTEM CONFIGURATIONS**
Can we develop the 1.5 million pound aerospace plane? p 515 A86-34195
The prop-fan - Initiation for a new generation of propulsion systems
[DGLR PAPER 85-166] p 501 A86-35188

**PROPULSION SYSTEM PERFORMANCE**
Evaluation of propfan propulsion applied to general aviation
[NASA-CR-175020] p 503 N86-24695

**PROTECTIVE COATINGS**
Life prediction and constitutive models for engine hot section anisotropic materials program
[NASA-CR-174952] p 526 N86-25003

**PROTOTYPES**
Using Ada in the real-time avionics environment issues and conclusions
[AD-A163844] p 533 N86-25151

**PUSHBROOM SENSOR MODES**
An airborne multiple-beam 1.4 GHz pushbroom microwave radiometer p 498 A86-33583

**PYLONS**
Ground vibration test of an F-16 airplane with modified decoupler pylons
[NASA-TM-87634] p 496 N86-24685
Experimental study of the effects of installation on singleand counter-rotation propeller noise
[NASA-TP-2541] p 536 N86-26102

## Q

**QUADRATIC EQUATIONS**
LQG/LTR design of a robust flight controller for the STOL F-15
[AD-A164111] p 512 N86-24708

**QUALITY CONTROL**
Review and critical analysis: Rolling-element bearings for system life and reliability
[NASA-CR-174710] p 525 N86-24991
Limitations of manual NDT systems and the No Eyes concept p 506 N86-25365
Advanced quantitative methods for nondestructive evaluation p 519 N86-25376

## R

**RADAR BEACONS**
Development and flight test of a helicopter, X-band, portable precision landing system concept
p 485 A86-35608

**RADAR SCATTERING**
Radar characteristics of flight vehicles --- Russian book p 485 A86-35464

**RADIATION ABSORPTION**
Comparison of absorption and radiation boundary conditions using a time-domain three-dimensional finite difference electromagnetic computer code
[AD-A163828] p 532 N86-25149

**RADIO ALTIMETERS**
Probabilistic modeling of fields of atmospheric turbulence and sea roughness with reference to the study of complex systems --- for flight control
p 528 A86-36480

**RADIO ANTENNAS**
VHF-FM communications antennas for project SINCGARS (UH-1 tail whip and cabin roof bent whip evaluation)
[AD-A163561] p 524 N86-24883

**RADIO NAVIGATION**
New developments in antennas of classical radio navigational and landing sytems p 484 A86-33741

**RADIO RECEIVERS**
First tests of an onboard MLS receiver
p 484 A86-33988

**RADIO RELAY SYSTEMS**
SHARP (Stationary High Altitude Relay Platforms) Telecommunications missions and systems
p 519 A86-33943
SHARP (Stationery High Altitude Relay Platform) - Rectenna and low altitude tests p 519 A86-33944

**RANDOM LOADS**
The effect of random forces on nonlinear oscillating systems p 535 A86-36710

**RANDOM PROCESSES**
Parametric optimization of algorithm for estimating values of one class of unsteady random processes
p 534 N86-26161

**RANDOM VIBRATION**
The effect of random forces on nonlinear oscillating systems p 535 A86-36710

**RANGE (EXTREMES)**
Twin-engine transport extended range operations
[SAE PAPER 851960] p 482 A86-35456

**RATES (PER TIME)**
Real-time flight test PCM data acquisition monitor
[AD-A164035] p 524 N86-24897

**REACTION KINETICS**
Altitude ignition/lean decel study
[AD-A163052] p 518 N86-24781
**REACTION TIME**
Head-up display (HUD) utility. II - Runway to HUD transitions monitoring eye focus and decision times
p 498 A86-33802
**REAL TIME OPERATION**
The application of systolic array processor technology to real-time control p 532 A86-36894
Techniques for increasing the update rate of real-time dynamic computer graphic displays p 523 A86-37072
An engineering approach to the use of expert systems technology in avionics applications
[NASA-TM-88263] p 497 N86-24667
A real-time simulation evaluation of an advanced detection, isolation and accommodation algorithm for sensor failures in turbine engines
[NASA-TM-87289] p 504 N86-24697
Real-time flight test PCM data acquisition monitor
[AD-A164035] p 524 N86-24897
Using Ada in the real-time avionics environment issues and conclusions
[AD-A163844] p 533 N86-25151
An application of adaptive learning to malfunction recovery
[NASA-CR-166620] p 533 N86-25169
Real-time in-flight thrust calculation on a digital electronic engine control-equipped F100 engine in an F-15 airplane
[PAPER-13] p 506 N86-25355
**RECONNAISSANCE AIRCRAFT**
Design of the CL-227 air vehicle p 487 A86-34924
Pacific aerosystems continues development of Heron 26 vehicle p 495 A86-36818
Developmental sciences prepares Skyeye for Army competition p 495 A86-36819
Army completing development tests for Lockheed Aquila RPV system p 495 A86-36820
Northrop delivers RPVs to Navy to aid in development proposal p 496 A86-36822
**RECTANGULAR PANELS**
Postbuckling failure of composite panels
p 523 A86-37112
**RECTENNAS**
SHARP (Stationary High Altitude Relay Platform) - Rectenna and low altitude tests p 519 A86-33944
**REDUNDANCY**
An optimization procedure for a redundant wing structure
[SAWE PAPER 1684] p 521 A86-35225
**REFUELING**
Automating knowledge acquisition in a flightline robot
[AD-A163829] p 525 N86-24997
**REGRESSION ANALYSIS**
Estimation of transport airplane aerodynamics using multiple stepwise regression p 480 A86-35385
**REGULATORS**
Time domain control design for robust stability of linear regulators - Application to aircraft control
p 508 A86-35383
**REINFORCEMENT (STRUCTURES)**
A weight method for structual boxes
[SAWE PAPER 1680] p 521 A86-35221
**RELIABILITY**
System life and reliability modeling for helicopter transmissions
[NASA-CR-3967] p 525 N86-24990
**RELIABILITY ANALYSIS**
The health and usage monitoring of helicopter systems - The next generation p 491 A86-35613
A reliability concept in structural optimization of flight vehicles p 494 A86-35977
An empirical study of flight control software reliability
[NASA-CR-176058] p 532 N86-25145
**REMOTE HANDLING**
Theoretical three-and four-axis gimbal robot wrists
[NASA-TP-2564] p 533 N86-25168
**REMOTE SENSORS**
High resolution millimeter-wave imaging sensor
p 498 A86-33590
**REMOTELY PILOTED VEHICLES**
Design of the CL-227 air vehicle p 487 A86-34924
Pacific aerosystems continues development of Heron 26 vehicle p 495 A86-36818
Developmental sciences prepares Skyeye for Army competition p 495 A86-36819
Army completing development tests for Lockheed Aquila RPV system p 495 A86-36820
U. S. Army plans to evaluate Canadair CL-227 sentinel
p 495 A86-36821
Northrop delivers RPVs to Navy to aid in development proposal p 496 A86-36822
**REPORTS**
Aircraft accident/incident summary reports: Concord, California, July 14, 1984; Atlanta, Georgia, September 24, 1984; Jasper, Alabama, December 16, 1984; Avalon, California, January 30, 1984; Charlottesville, Virginia, February 17, 1984; Kansas City, Kansas, January 9, 1985
[PB86-910410] p 484 N86-25333
**RESEARCH AIRCRAFT**
Sikorsky Aircraft crew station technology research helicopter
[SAE PAPER 851780] p 480 A86-35442
The flying simulator and technology carrier ATTAS from DFVLR p 490 A86-35520
Summary of results of NASA F-15 flight research program
[AIAA PAPER 86-9761] p 496 A86-37064
**RESEARCH AND DEVELOPMENT**
Development trends in the case of high-performance aircraft
[DGLR PAPER 85-106] p 473 A86-35163
The consideration of pilot factors in development of future collision avoidance systems
[SAE PAPER 851807] p 484 A86-35437
Advanced concepts transport aircraft of 1995
[SAE PAPER 851808] p 490 A86-35438
Damage tolerant composite design development
p 524 A86-37119
Langley aerospace test highlights, 1985
[NASA-TM-87703] p 537 N86-26276
**RESEARCH FACILITIES**
Survey of supersonic combustion ramjet research at Langley
[AIAA PAPER 86-0159] p 503 A86-37079
Current wind tunnel capability and planned improvements at the NASA Langley Research Center
[AIAA PAPER 86-0727] p 514 A86-37087
**RESERVOIRS**
Fireproof hydraulic brake system
[AD-A163542] p 497 N86-24688
**RESIDUAL STRENGTH**
Comparison of the strength and damage tolerance of aluminium alloys p 516 A86-36178
**RESIDUAL STRESS**
Aspects of small crack growth p 518 N86-25370
**RETIREMENT FOR CAUSE**
Manufacturing technology for nondestructive evaluation (NDE) system to implement Retirement For Cause (RFC) procedures for gas turbine engine components
p 507 N86-25368
**REUSABLE LAUNCH VEHICLES**
Weights assessment for orbit-on-demand vehicles
[SAWE PAPER 1674] p 515 A86-35217
**REYNOLDS NUMBER**
Experimental study of the supersonic turbulent boundary layer on a blunted axisymmetric body
[AD-A163736] p 479 N86-24669
**RIGID ROTORS**
Effects of analytical modeling assumptions on the predicted stability of a model hingeless rotor
p 490 A86-35605
X-wing potential for Navy applications
p 492 A86-35631
**RING STRUCTURES**
Flight investigation of Bell model 206 ring fin
p 491 A86-35624
**ROBOTICS**
Robotics in aircraft manufacturing p 522 A86-35660
**ROBOTS**
Automating knowledge acquisition in a flightline robot
[AD-A163829] p 525 N86-24997
Theoretical three-and four-axis gimbal robot wrists
[NASA-TP-2564] p 533 N86-25168
**ROBUSTNESS (MATHEMATICS)**
Time domain control design for robust stability of linear regulators - Application to aircraft control
p 508 A86-35383
Coordinated bank-to-turn autopilot design
p 509 A86-35384
Application of FDI metrics to detection and isolation of sensor failures in turbine engines p 501 A86-35400
Robust detection, isolation, and accommodation for sensor failures --- in jet engine control systems
p 501 A86-35402
Tine domain design of robust controllers for LQG (Linear Quadratic Gaussian); application to large space structures
[AD-A163635] p 533 N86-26074
**ROLL**
Roll-damping measurements on two flight body configurations in the Goettingen DFVLR-AVA transonic wind tunnel
[DGLR PAPER 85-090] p 506 A86-35153
**ROLLER BEARINGS**
Review and critical analysis: Rolling-element bearings for system life and reliability
[NASA-CR-174710] p 525 N86-24991
**ROTARY STABILITY**
Effects of analytical modeling assumptions on the predicted stability of a model hingeless rotor
p 490 A86-35605
Characteristics pertaining to a stiffness cross-coupled Jeffcott model
[ASME PAPER 85-DET-144] p 523 A86-37071
**ROTARY WING AIRCRAFT**
Design of the CL-227 air vehicle p 487 A86-34924
U. S. Army plans to evaluate Canadair CL-227 sentinel
p 495 A86-36821
Swashplate control system
[NASA-CASE-ARC-11633-1] p 511 N86-24700
**ROTARY WINGS**
A method for numerical analysis of the dynamics of a controlled rotor blade of a helicopter
p 486 A86-33998
Analytic representation of steady and unsteady aerodynamic coefficients of modern helicopter rotors
[DGLR PAPER 85-114] p 474 A86-35167
Helicopter gust alleviation, attitude stabilization, and vibration alleviation using individual-blade-control through a conventional swash plate p 510 A86-35604
Effects of analytical modeling assumptions on the predicted stability of a model hingeless rotor
p 490 A86-35605
Gearbox configuration analysis p 521 A86-35611
Model helicopter blade slap at low tip speeds - Theoretical and experimental correlations
p 535 A86-35621
Free-tip-rotor wind-tunnel test results
p 491 A86-35628
Preliminary estimate of fatigue life for dynamic components of a new helicopter p 493 A86-35639
Combining analysis and test for rotor blade development p 493 A86-35648
Group studies of equations of the laminar boundary layer on a rotating wing p 476 A86-35994
Helicopter rotor noise due to ingestion of atmospheric turbulence
[NASA-CR-3973] p 535 N86-25216
Cost estimating relationships for fixed wing aircraft: List price versus empty weight
[AD-A164196] p 537 N86-25300
**ROTATING BODIES**
Normal force characteristics of sharp nosed bodies of revolution at high angles of attack in subsonic and transonic flow p 527 N86-25555
**ROTOR AERODYNAMICS**
A method for numerical analysis of the dynamics of a controlled rotor blade of a helicopter
p 486 A86-33998
Higher harmonic control - Wind tunnel demonstration of fully effective vibratory hub force suppression
p 509 A86-35602
Free-tip-rotor wind-tunnel test results
p 491 A86-35628
A new approach to the free wake problem for hovering rotors p 475 A86-35633
Applied aerodynamics of circulation control airfoils and rotors p 475 A86-35634
Aerodynamic performance of a 27-percent-scale AH-64 wind-tunnel model with baseline/advanced rotor blades
p 492 A86-35635
Hovering rotor airload prediction using a full potential flow analysis with realistic wake geometry
p 475 A86-35636
The aerodynamics of rotor blades with ice shapes accreted in hover and in level flight p 476 A86-35655
The importance of dynamic stall in aerodynamic modeling of the Darrieus rotor p 528 A86-36448
Rotor performance characteristics from an aeroacoustic helicopter wind-tunnel test program
[NASA-TM-87661] p 479 N86-24665
Passive eddy-current damping as a means of vibration control in cryogenic turbomachinery
[NASA-TP-2562] p 515 N86-24722
**ROTOR BLADES**
A method for numerical analysis of the dynamics of a controlled rotor blade of a helicopter
p 486 A86-33998
Measurements regarding the emission angle dependence of propeller-acoustic pressure/time signals, taking into account passing flight conditions
[DGLR PAPER 85-112] p 534 A86-35165
Higher harmonic control - Vibration reduction for reduced weight --- for helicopters
[SAWE PAPER 1679] p 489 A86-35220
Design aspects of the XV-15 advanced technology blade program p 492 A86-35630
Combining analysis and test for rotor blade development p 493 A86-35648

**ROTOR BLADES (TURBOMACHINERY)**
Rotor performance characteristics from an aeroacoustic helicopter wind-tunnel test program
[NASA-TM-87661] p 479 N86-24665

**ROTOR BODY INTERACTIONS**
Calculation of the steady-state transverse vibrations of the system rotors-housing of a gas-turbine engine
p 503 A86-36741

**ROTOR SYSTEMS RESEARCH AIRCRAFT**
RSRA flight development test in the airplane configuration --- Rotor Systems Research Aircraft
p 493 A86-35653

**ROTORCRAFT AIRCRAFT**
Description and initial flight experiments - Boeing ARTI test bed --- Advanced Rotorcraft Technology Integration
p 493 A86-35652
The performance characteristics of simulated ice on rotorcraft airfoils p 482 A86-35656
Crashworthy design of rotorcraft - A basic research approach p 494 A86-35665

**ROTORS**
Characteristics pertaining to a stiffness cross-coupled Jeffcott model
[ASME PAPER 85-DET-144] p 523 A86-37071
One-piece HPTR blade squealer tip
[AD-D012003] p 504 N86-24698
Swashplate control system
[NASA-CASE-ARC-11633-1] p 511 N86-24700
Unsteady heat transfer and direct comparison to steady-state measurements in a rotor-wake experiment
[NASA-TM-87220] p 524 N86-24934

**RUN TIME (COMPUTERS)**
The possibility of achieving high productivity with vector-pipeline processors in solving problems of mathematical physics p 531 A86-36574

**RUNWAY CONDITIONS**
Head-up display (HUD) utility. II - Runway to HUD transitions monitoring eye focus and decision times
p 498 A86-33802
The optimal take-off run of an aircraft on an unpaved surface p 494 A86-35978

**RUNWAYS**
Computed centerline MLS (Microwave Landing System) approach demonstration at Washington National Airport
[AD-A163722] p 486 N86-24681
Fireproof hydraulic brake system
[AD-A163542] p 497 N86-24688
Materials for emergency repair of runways
[AD-A164225] p 514 N86-25385

S

**SAFETY DEVICES**
VSTOL aircraft ice protection design considerations
p 493 A86-35654

**SCALE MODELS**
The role of scale models in the design of 'low BVI noise' rotorcraft p 534 A86-35617

**SCHEDULING**
Simulation of time-control procedures for terminal area flow management p 484 A86-35369

**SEA ROUGHNESS**
Probabilistic modeling of fields of atmospheric turbulence and sea roughness with reference to the study of complex systems --- for flight control
p 528 A86-36480

**SEAPLANES**
Optimization of seaplanes
[DGLR PAPER 85-170] p 488 A86-35189

**SEATS**
The design and development of new crashworthy seats for Navy helicopters p 494 A86-35662
Simulation of aircraft seat response to a crash environment p 530 A86-36879
A review of the pilot backache problem in the CH113 Labrador helicopter
[AD-A164011] p 530 N86-25113

**SELF ADAPTIVE CONTROL SYSTEMS**
An application of self-tuning regulator to GLA system of an aircraft --- Gust Load Alleviation
p 508 A86-34926

**SEMISPAN MODELS**
Correlation of stability test results and analysis for the 1/5 scale V-22 aeroelastic model p 490 A86-35603

**SENSORS**
Application of FDI metrics to detection and isolation of sensor failures in turbine engines p 501 A86-35400
Robust detection, isolation, and accommodation for sensor failures --- in jet engine control systems
p 501 A86-35402

**SEPARATED FLOW**
Analytic representation of steady and unsteady aerodynamic coefficients of modern helicopter rotors
[DGLR PAPER 85-114] p 474 A86-35167
Velocity distribution around a wing in a wind tunnel Verification of a calculation method by means of a laser anemometer p 476 A86-35925
Investigation of heat transfer in separation regions in supersonic flow in a Laval nozzle p 477 A86-36458
A numerical analysis applied to high angle of attack three-dimensional inlets
[NASA-TM-87298] p 478 N86-24658
ALESEP. Part 2: A computer program for the analysis of leading edge separation bubbles on infinite swept wings
[NASA-CR-178015] p 479 N86-24664
Experimental study of the supersonic turbulent boundary layer on a blunted axisymmetric body
[AD-A163736] p 479 N86-24669
Increments in aerofoil maximum lift coefficient due to deployment of various high-lift devices
[ESDU-85033] p 480 N86-25325

**SEPARATORS**
Fireproof hydraulic brake system
[AD-A163542] p 497 N86-24688

**SERVICE LIFE**
The health and usage monitoring of helicopter systems - The next generation p 491 A86-35613
The possibility of using ion implantation for increasing the life of the compressor blades of gas-turbine aircraft engines p 522 A86-35998
An analysis of rig test disc failures
p 527 N86-25381

**SHAFTS (MACHINE ELEMENTS)**
Fatigue failure of jet engine drive shafts
p 500 A86-33970

**SHAPES**
A study of a collision avoidance system mounted on a curved ground plane
[NASA-CR-176771] p 485 N86-24677

**SHEAR LAYERS**
Inviscid vortex-stretched turbulent shear-layer flow computed around a cranked delta wing
p 475 A86-35253

**SHIELDING**
An experimental investigation of reducing advanced turboprop cabin noise by wing shielding
[NASA-TM-87112] p 536 N86-25218

**SHOCK WAVE PROPAGATION**
Weakly nonlinear acoustic and shock-wave theory of the noise of advanced high-speed turbopropellers
p 534 A86-35146
Limiting values of the specific parameters of a ramjet engine p 502 A86-35992

**SHOCK WAVES**
Experimental study of the supersonic turbulent boundary layer on a blunted axisymmetric body
[AD-A163736] p 479 N86-24669
Hypersonic flow around a wing at large angles of attack with detached compression jump p 480 N86-25534

**SHORT TAKEOFF AIRCRAFT**
AV-8B High Angle of Attack/departure resistance system flight test program
[AIAA PAPER 86-9729] p 496 A86-37082
In-flight measurements of wing ice shapes and wing section drag increases caused by natural icing conditions
[NASA-TM-87301] p 479 N86-24667
Experimental study of apex fences for lift enhancement on a highly swept delta wing configuration
[AD-A163877] p 512 N86-24705
Multivariable control law design for enhanced air combat maneuvering. F-15/STOL (Short Take-Off and Landing) derivative fighter
[AD-A164017] p 512 N86-24706
An LQG up-and away flight control design for the STOL F-15 aircraft
[AD-A164108] p 512 N86-24707
LQG/LTR design of a robust flight controller for the STOL F-15
[AD-A164111] p 512 N86-24708
Multivariable output control law design for the STOL (Short Takeoff and Landing) F-15 in landing configuration
[AD-A164516] p 498 N86-25340
An LQG up-and away flight control design for the STOL F-15 aircraft
[AD-A164108] p 512 N86-25384

**SIGNAL ENCODING**
Real-time flight test PCM data acquisition monitor
[AD-A164035] p 524 N86-24897

**SIGNS AND SYMPTOMS**
A review of the pilot backache problem in the CH113 Labrador helicopter
[AD-A164011] p 530 N86-25113

**SIKORSKY AIRCRAFT**
Effects of variations in crashworthiness criteria on Sikorsky S-75 ACAP landing gear weights
p 492 A86-35638

**SINGLE CRYSTALS**
Life prediction and constitutive models for engine hot section anisotropic materials program
[NASA-CR-174952] p 526 N86-25003

**SITES**
Computed centerline MLS (Microwave Landing System) approach demonstration at Washington National Airport
[AD-A163722] p 486 N86-24681

**SKIN FRICTION**
Experimental study of the supersonic turbulent boundary layer on a blunted axisymmetric body
[AD-A163736] p 479 N86-24669

**SLENDER BODIES**
Investigation of rolling-up and interaction of leading-edge and trailing-edge vortex sheets on a slender delta wing
[AD-A163692] p 479 N86-24668

**SMOKE**
Data sources for parameters used in predictive modeling of fire growth and smoke spread
[PB86-130986] p 518 N86-24788

**SODIUM SULFATES**
Na2SO4 induced corrosion of nickel at high temperature p 517 A86-37073

**SOFTWARE ENGINEERING**
An avionics software test and evaluation technique
p 499 A86-35650
An empirical study of flight control software reliability
[NASA-CR-178058] p 532 N86-25145

**SOIL MOISTURE**
An airborne multiple-beam 1.4 GHz pushbroom microwave radiometer p 498 A86-33583

**SOLID ELECTRODES**
The effect of the electrode gap geometry on current distribution during electrochemical rounding of edges
p 522 A86-35980

**SOUND FIELDS**
Flow field and near and far sound field of a subsonic jet p 476 A86-35855

**SOUND PRESSURE**
Measurements regarding the emission angle dependence of propeller-acoustic pressure/time signals, taking into account passing flight conditions
[DGLR PAPER 85-112] p 534 A86-35165

**SPACE COMMERCIALIZATION**
Commercial applications of the Navstar Global Positioning System p 514 A86-34112

**SPACE SHUTTLE MISSION 61-B**
Selections from Flug Revue und Flugwelt International. A. On the border of Time-hypersonic flight. B. NASA programs pave the way for the hypersonic aircraft. C. Shuttle flight 61-B; construction in space. D. Faster than a bullet; hypersonic military aircraft
[NASA-TM-88418] p 474 N86-24652

**SPACECRAFT STRUCTURES**
Selections from Flug Revue und Flugwelt International. A. On the border of Time-hypersonic flight. B. NASA programs pave the way for the hypersonic aircraft. C. Shuttle flight 61-B; construction in space. D. Faster than a bullet; hypersonic military aircraft
[NASA-TM-88418] p 474 N86-24652
Tine domain design of robust controllers for LQG (Linear Quadratic Gaussian); application to large space structures
[AD-A163635] p 533 N86-26074

**SPARE PARTS**
Spare parts pricing - Impact on logistics support
p 537 A86-35647

**SPARKS**
Altitude ignition/lean decel study
[AD-A163052] p 518 N86-24781

**SPECKLE PATTERNS**
The development of laser speckle velocimetry for the measurement of vortical flow fields
[AIAA PAPER 86-0768] p 523 A86-37091

**SPECTRAL ENERGY DISTRIBUTION**
Evaluation of a frequency response technique for aircraft system identification
[AD-A164367] p 497 N86-25339

**SPIN TESTS**
Evaluation of cyclic spin pit tests for the damage tolerance of disks p 507 N86-25379

**STABILITY**
Natural laminar flow flight experiments on a swept wing business jet-boundary layer stability analyses
[NASA-CR-3975] p 478 N86-24659
Investigation of a nozzle instability on an F100 engine equipped with a digital electronic engine control
[PAPER-12] p 506 N86-25354

**STABILITY AUGMENTATION**
Preliminary design of low authority SAS. I --- stability augmentation system p 510 A86-36772

**STAGNATION POINT**
Experimental study of the supersonic turbulent boundary layer on a blunted axisymmetric body
[AD-A163736] p 479 N86-24669

**STATE ESTIMATION**
Use of state estimation to calculate angle-of-attack position error from flight test data
[AD-A163962] p 480 N86-24670

**STATIC PRESSURE**
Effects of inlet distortion on a static pressure probe mounted on the engine hub in an F-15 airplane
[PAPER-5] p 505 N86-25347

**STATIC STABILITY**
Comparison of the strength and damage tolerance of aluminium alloys p 516 A86-36176

**STATIC TESTS**
757 Major Static Test instrumentation systems
p 520 A86-34636

**STATISTICAL ANALYSIS**
ALESEP. Part 2: A computer program for the analysis of leading edge separation bubbles on infinite swept wings
[NASA-CR-178015] p 479 N86-24664

**STEADY FLOW**
Analytic representation of steady and unsteady aerodynamic coefficients of modern helicopter rotors
[DGLR PAPER 85-114] p 474 A86-35167
Analysis of a three-dimensional stationary turbulent boundary layer on the root section of a wing without allowance for compressibility p 476 A86-35991

**STEADY STATE**
Calculation of the steady-state transverse vibrations of the system rotors-housing of a gas-turbine engine
p 503 A86-36741

**STIFFNESS**
Characteristics pertaining to a stiffness cross-coupled Jeffcott model
[ASME PAPER 85-DET-144] p 523 A86-37071

**STOCHASTIC PROCESSES**
The effect of random forces on nonlinear oscillating systems p 535 A86-36710

**STORMS (METEOROLOGY)**
Loads and motions of an F-106B flying through thunderstorms
[NASA-TM-87671] p 483 N86-24672
DFW (Dallas-Ft. Worth) microburst on August 2, 1985
[NASA-CR-176794] p 529 N86-25956

**STRAIN MEASUREMENT**
Straining for weight savings in advanced composites
[SAWE PAPER 1685] p 516 A86-35226

**STRAPDOWN INERTIAL GUIDANCE**
LMR-83 - Inertial measurement unit for flight regulation and navigation
[DGLR PAPER 85-132] p 508 A86-35177

**STRESS (PHYSIOLOGY)**
A review of the pilot backache problem in the CH113 Labrador helicopter
[AD-A164011] p 530 N86-25113

**STRESS ANALYSIS**
Advanced topics in boundary element analysis; Proceedings of the Winter Annual Meeting, Miami Beach, FL, November 17-22, 1985 p 520 A86-34442
Stress analysis of gas turbine engine structures using the boundary element method p 520 A86-34444
Fatigue life in a coupled problem concerning the motion of a flexible wing p 474 A86-35082
Aspects of small crack growth p 518 N86-25370

**STRESS MEASUREMENT**
Determination of wing deformation in wind tunnel models using stress measurement section technology
[DGLR PAPER 85-091] p 474 A86-35154

**STRESS-STRAIN RELATIONSHIPS**
Method to determine the complete three-dimensional elastic compliance matrix of composite materials
p 517 A86-37134

**STRUCTURAL ANALYSIS**
Stress analysis of gas turbine engine structures using the boundary element method p 520 A86-34444
Photogrammetry as a means of mapping postbuckled composite surfaces p 520 A86-34639
Some characteristics of structure formation in forged semifinished products of V93pch aluminum alloy
p 522 A86-35999
Drop testing and analysis of six-foot diameter graphite-epoxy frames p 517 A86-37068
Engine cyclic durability by analysis and testing: Highlights of the spring 1984 PEP Meeting p 506 N86-25362
Tine domain design of robust controllers for LQG (Linear Quadratic Gaussian); application to large space structures
[AD-A163635] p 533 N86-26074

**STRUCTURAL DESIGN**
Design aspects of the XV-15 advanced technology blade program p 492 A86-35630
Damage tolerant composite design development
p 524 A86-37119
Data on MI-26 helicopter p 498 N86-25602

**STRUCTURAL DESIGN CRITERIA**
The impact of accommodating defects on the efficiency of aircraft design
[SAWE PAPER 1635] p 488 A86-35201
Effects of variations in crashworthiness criteria on Sikorsky S-75 ACAP landing gear weights
p 492 A86-35638
Survey of crashworthiness achievements on Aerospatiale helicopters p 493 A86-35642
Tilt rotor crashworthiness p 493 A86-35661
The Hughes integrated approach to helicopter crashworthiness Past, present, and future
p 494 A86-35663
Crashworthy design of rotorcraft - A basic research approach p 494 A86-35665
Study of the effects of discretizing quantitative feedback theory analog control system designs
[AD-A164209] p 533 N86-25174

**STRUCTURAL ENGINEERING**
Advanced composites - The structural revolution
p 517 A86-37136

**STRUCTURAL FAILURE**
Fatigue failure of jet engine drive shafts
p 500 A86-33970

**STRUCTURAL RELIABILITY**
A reliability concept in structural optimization of flight vehicles p 494 A86-35977

**STRUCTURAL STABILITY**
The effect of center delamination on the instability of composite cylindrical panels p 520 A86-34642
Fourteenth NASTRAN Users' Colloquium
[NASA-CP-2419] p 527 N86-25823

**STRUCTURAL STRAIN**
Effect of fiber and matrix maximum strain on the energy absorption of composite materials p 516 A86-35640

**STRUCTURAL VIBRATION**
A method for numerical analysis of the dynamics of a controlled rotor blade of a helicopter
p 486 A86-33996
Higher harmonic control - Vibration reduction for reduced weight --- for helicopters
[SAWE PAPER 1679] p 489 A86-35220
Vibration characteristics of aircraft engine-bladed-disk assembly p 502 A86-35865

**STRUCTURAL WEIGHT**
The development of an advanced weight estimation technique for aircraft conceptual design
[SAWE PAPER 1645] p 531 A86-35204
Weight assessment of electronic boxes --- for aircraft design
[SAWE PAPER 1661] p 499 A86-35207
The Grumman X-29 technology demonstrator - Technology interplay and weight evolution
[SAWE PAPER 1665] p 488 A86-35210
Requirements for second generation aircraft weighing systems
[SAWE PAPER 1669] p 513 A86-35213
A weight method for structual boxes
[SAWE PAPER 1680] p 521 A86-35221
Starship I - A weight control challenge --- for next generation business aircraft
[SAWE PAPER 1682] p 489 A86-35223
Weight control of aircraft modification projects
[SAWE PAPER 1683] p 489 A86-35224
Influences of two landing gear designs on helicopter crashworthiness and weights p 492 A86-35632
Effects of variations in crashworthiness criteria on Sikorsky S-75 ACAP landing gear weights
p 492 A86-35638
The effect of the admissible centering misalignment of a transport aircraft on its mass p 495 A86-35981

**SUBROUTINES**
Development and evaluation of math library routines for a 1750A airborne microcomputer
[AD-A164050] p 533 N86-26030

**SUBSONIC AIRCRAFT**
Advanced boundary layer transition measurement methods for flight applications
[AIAA PAPER 86-9786] p 500 A86-37083

**SUBSONIC FLOW**
Flow field and near and far sound field of a subsonic jet p 476 A86-35855

**SUBSONIC SPEED**
Calculation of the dynamic response of a flight vehicle using a discrete-continuous model p 476 A86-35979

**SUPERCOOLING**
An assessment of data quality and quantity from airborne cloud physics projects from 1974 through 1984
[DOT/FAA/CT-85/37] p 528 N86-25079

**SUPERCRITICAL FLOW**
Inverse design of supercritical nozzles and cascades
p 477 A86-36207

**SUPERHIGH FREQUENCIES**
Development and flight test of a helicopter, X-band, portable precision landing system concept
p 485 A86-35608

**SUPERPOSITION (MATHEMATICS)**
The superposition distortion index --- in axial flow fans of turbofan engines p 500 A86-34279

**SUPERSONIC AIRCRAFT**
Configuration aspects of modern high-performance aircraft
[DGLR PAPER 85-130] p 488 A86-35176
Use of state estimation to calculate angle-of-attack position error from flight test data
[AD-A163962] p 480 N86-24670
Low-speed performance of an axisymmetric, mixed-compression, supersonic inlet with auxiliary inlets
[NASA-TP-2557] p 503 N86-24694

**SUPERSONIC AIRFOILS**
Fatigue life in a coupled problem concerning the motion of a flexible wing p 474 A86-35082

**SUPERSONIC BOUNDARY LAYERS**
Experimental study of the supersonic turbulent boundary layer on a blunted axisymmetric body
[AD-A163736] p 479 N86-24669

**SUPERSONIC COMBUSTION RAMJET ENGINES**
Limiting values of the specific parameters of a ramjet engine p 502 A86-35992
Survey of supersonic combustion ramjet research at Langley
[AIAA PAPER 86-0159] p 503 A86-37079

**SUPERSONIC FLIGHT**
Advanced boundary layer transition measurement methods for flight applications
[AIAA PAPER 86-9786] p 500 A86-37083

**SUPERSONIC FLOW**
Rising of the Ferrie point on the windward side of delta wings p 474 A86-34485
Analytic representation of steady and unsteady aerodynamic coefficients of modern helicopter rotors
[DGLR PAPER 85-114] p 474 A86-35167
The method of fundamental solutions in aerodynamics. II Applications to the theory of lifting surfaces in supersonic flow p 477 A86-36285
Investigation of heat transfer in separation regions in supersonic flow in a Laval nozzle p 477 A86-36458
Characteristics of the interaction of interference and diffraction flows at supersonic velocities
p 478 A86-36459
Supersonic flow around blunt perforated shields
p 480 N86-25558

**SUPERSONIC INLETS**
Low-speed performance of an axisymmetric, mixed-compression, supersonic inlet with auxiliary inlets
[NASA-TP-2557] p 503 N86-24694

**SUPERSONIC WAKES**
Experimental study of the supersonic turbulent boundary layer on a blunted axisymmetric body
[AD-A163736] p 479 N86-24669

**SUPPORTS**
A review of the pilot backache problem in the CH113 Labrador helicopter
[AD-A164011] p 530 N86-25113

**SURFACES**
The method of fundamental solutions in aerodynamics. II Applications to the theory of lifting surfaces in supersonic flow p 477 A86-36285

**SWEPT FORWARD WINGS**
The Grumman X-29 technology demonstrator - Technology interplay and weight evolution
[SAWE PAPER 1665] p 488 A86-35210

**SWEPT WINGS**
Natural laminar flow flight experiments on a swept wing business jet-boundary layer stability analyses
[NASA-CR-3975] p 478 N86-24659
ALESEP. Part 2: A computer program for the analysis of leading edge separation bubbles on infinite swept wings
[NASA-CR-178015] p 479 N86-24664
Experimental study of apex fences for lift enhancement on a highly swept delta wing configuration
[AD-A163877] p 512 N86-24705

**SWIRLING**
Laser anemometer measurements of the flow from a simulated fuel nozzle p 520 A86-34410

**SYMMETRY**
Experimental study of the supersonic turbulent boundary layer on a blunted axisymmetric body
[AD-A163736] p 479 N86-24669

**SYSTEM EFFECTIVENESS**
System life and reliability modeling for helicopter transmissions
[NASA-CR-3967] p 525 N86-24990

**SYSTEM FAILURES**
Application of FDI metrics to detection and isolation of sensor failures in turbine engines p 501 A86-35400
Robust detection, isolation, and accommodation for sensor failures --- in jet engine control systems
p 501 A86-35402

Aircraft accident/incident summary reports: Denver, Colorado, August 19, 1983; Blountville, Tennessee, July 16, 1983; Tucson, Arizona; February 6, 1983, Cockeysville, Maryland, April 28, 1984; Akron, Ohio, September 30, 1984; Seattle, Washington, October 18, 1984; Miami, Florida, November 11, 1983
[PB85-910409] p 463 N86-24875

**SYSTEM IDENTIFICATION**
Evaluation of a frequency response technique for aircraft system identification
[AD-A164367] p 497 N86-25339

**SYSTEMS ENGINEERING**
Computed centerline MLS (Microwave Landing System) approach demonstration at Washington National Airport
[AD-A163722] p 486 N86-24681
Study of the effects of discretizing quantitative feedback theory analog control system designs
[AD-A164209] p 533 N86-25174

**SYSTEMS INTEGRATION**
A completely integrated system for the treatment of crack growth test data p 531 A86-34635
Integrated avionics suite as implemented on the Agusta A-129 p 500 A86-35666
An integrated display for vertical and translational flight Eight factors affecting pilot performance
p 529 A86-36175

**SYSTEMS SIMULATION**
Transient model of a pneumatic ejector - Application to the simulation of aircraft bleed air temperature control systems p 489 A86-35405

**SYSTEMS STABILITY**
Time domain control design for robust stability of linear regulators - Application to aircraft control
p 508 A86-35383

## T

**TAKEOFF**
A note on the prediction of flying boat take-off
p 487 A86-34158
LQG/LTR design of a robust flight controller for the STOL F-15
[AD-A164111] p 512 N86-24708

**TAKEOFF RUNS**
The optimal take-off run of an aircraft on an unpaved surface p 494 A86-35978

**TARGET DRONE AIRCRAFT**
Northrop delivers RPVs to Navy to aid in development proposal p 496 A86-36822

**TECHNOLOGICAL FORECASTING**
Guidance, navigation, and control for 21st century aircraft p 508 A86-34194
Aircraft engine technology windows (Lecture)
p 502 A86-36336

**TECHNOLOGY ASSESSMENT**
Cockpit automation technology - A further look
p 499 A86-33814
Development trends in the case of high-performance aircraft
[DGLR PAPER 85-106] p 473 A86-35163
The prop-fan - Initiation for a new generation of propulsion systems
[DGLR PAPER 85-166] p 501 A86-35188
The Grumman X-29 technology demonstrator - Technology interplay and weight evolution
[SAWE PAPER 1665] p 488 A86-35210
Classification of flight vehicles according to the type of propulsion - Determination of the type and number of lift solutions p 473 A86-35983
Aircraft engine technology windows (Lecture)
p 502 A86-36336

**TECHNOLOGY TRANSFER**
Control technology for future aircraft propulsion systems
[PAPER-14] p 506 N86-25356

**TECHNOLOGY UTILIZATION**
Applicability of using the CAR-II model in design and evaluation of multioperator workstations with shared controls p 529 A86-33805
X-wing potential for Navy applications
p 492 A86-35631

**TEMPERATURE CONTROL**
Transient model of a pneumatic ejector - Application to the simulation of aircraft bleed air temperature control systems p 489 A86-35405

**TEMPERATURE DEPENDENCE**
Method to determine the complete three-dimensional elastic compliance matrix of composite materials
p 517 A86-37134

**TEMPERATURE EFFECTS**
Emission FTIR analyses of thin microscopic patches of jet fuel residues deposited on heated metal surfaces
[NASA-CR-176786] p 519 N86-25502

**TENSILE TESTS**
Method to determine the complete three-dimensional elastic compliance matrix of composite materials
p 517 A86-37134

**TEST EQUIPMENT**
757 Major Static Test instrumentation systems
p 520 A86-34636
The development of a system for the study of fatigue crack growth up to 2000 Hz p 520 A86-34641
Practical diagnostics of aircraft gas turbines --- Russian book p 502 A86-35472
Description and initial flight experiments - Boeing ARTI test bed --- Advanced Rotorcraft Technology Integration
p 493 A86-35652

**TEST FACILITIES**
Helicopter test installation RoTeSt in DNW - Application and results
[DGLR PAPER 85-113] p 513 A86-35166

**THERMAL FATIGUE**
Thermal-mechanical fatigue behavior of nickel-base superalloys
[NASA-CR-175048] p 518 N86-24818

**THERMAL MAPPING**
Thermal scene generators p 522 A86-36805

**THERMODYNAMICS**
Thermal-mechanical fatigue behavior of nickel-base superalloys
[NASA-CR-175048] p 518 N86-24818

**THERMOMECHANICAL TREATMENT**
Multiaxial and thermomechanical fatigue considerations in damage tolerant design p 526 N86-25375

**THERMOPLASTIC RESINS**
Aramid fiber composites for general engineering
p 517 A86-37137

**THIN WALLED SHELLS**
Postbuckling and crippling behavior of graphite/epoxy thin-walled airframe members p 521 A86-35643

**THREE DIMENSIONAL BODIES**
Calculation of the aerodynamic characteristics of three-dimensional wings of finite span in a potential incompressible flow p 476 A86-35985

**THREE DIMENSIONAL BOUNDARY LAYER**
Analysis of a three-dimensional stationary turbulent boundary layer on the root section of a wing without allowance for compressibility p 476 A86-35991

**THREE DIMENSIONAL FLOW**
Implicit, vectorizable schemes for the flux-difference split, three-dimensional Navier-Stokes equations
p 523 A86-37067

**THROTTLING**
Flight testing the digital electronic engine control in the F-15 airplane
[PAPER-6] p 505 N86-25348

**THRUST AUGMENTATION**
Control technology for future aircraft propulsion systems
[PAPER-14] p 506 N86-25356

**THRUST CONTROL**
Digital Electronic Engine Control (DEEC) Flight Evaluation in an F-15 Airplane
[NASA-CP-2298] p 504 N86-25342

**THRUST MEASUREMENT**
Real-time in-flight thrust calculation on a digital electronic engine control-equipped F100 engine in an F-15 airplane
[PAPER-13] p 506 N86-25355

**THRUST VECTOR CONTROL**
Multivariable control law design for enhanced air combat maneuvering. F-15/STOL (Short Take-Off and Landing) derivative fighter
[AD-A164017] p 512 N86-24706

**THUNDERSTORMS**
Loads and motions of an F-106B flying through thunderstorms
[NASA-TM-87671] p 483 N86-24672

**TILT ROTOR AIRCRAFT**
Application of CFD design technology in development of the JVX engine inlet p 502 A86-35612
Tilt rotor crashworthiness p 493 A86-35661

**TIME DIVISION MULTIPLEXING**
Real-time flight test PCM data acquisition monitor
[AD-A164035] p 524 N86-24897

**TIME FUNCTIONS**
Aircraft Noise Prediction Program theoretical manual: Propeller aerodynamics and noise
[NASA-TM-83199-PT-3] p 536 N86-25220
Development and evaluation of math library routines for a 1750A airborne microcomputer
[AD-A164050] p 533 N86-26030

**TIRES**
Fireproof hydraulic brake system
[AD-A163542] p 497 N86-24688

**TITANIUM ALLOYS**
Process development and test evaluation of cast, HIP and heat treated titanium UH-60A M.R. Damper Bracket
p 516 A86-35641
AGARD Cooperative Test Progamme on titanium alloy engine disc material p 507 N86-25369
Crack growth in near-alpha titanium alloys
p 526 N86-25371
Fracture mechanics and LCF-properties of engine discs of Ti 6Al-4V, Inconel 718 and Udimet 700 P/M-HIP
p 507 N86-25378

**TOLERANCES (MECHANICS)**
The impact of accommodating defects on the efficiency of aircraft design
[SAWE PAPER 1635] p 488 A86-35201
Damage Tolerance Concepts for Critical Engine Components
[AGARD-CP-393] p 506 N86-25360
Damage tolerance concepts for critical engine components p 506 N86-25361
AGARD Cooperative Test Progamme on titanium alloy engine disc material p 507 N86-25369
Multiaxial and thermomechanical fatigue considerations in damage tolerant design p 526 N86-25375
Evaluation of cyclic spin pit tests for the damage tolerance of disks p 507 N86-25379

**TORSIONAL STRESS**
Method to determine the complete three-dimensional elastic compliance matrix of composite materials
p 517 A86-37134

**TRACKING (POSITION)**
Radar characteristics of flight vehicles --- Russian book p 485 A86-35464
An LQG up-and away flight control design for the STOL F-15 aircraft
[AD-A164108] p 512 N86-24707
An LQG up-and away flight control design for the STOL F-15 aircraft
[AD-A164108] p 512 N86-25384

**TRACKING FILTERS**
New linear tracking filters --- for modeling target maneuvering aircraft motion p 508 A86-35342

**TRAILING EDGE FLAPS**
Experimental study of apex fences for lift enhancement on a highly swept delta wing configuration
[AD-A163877] p 512 N86-24705

**TRAILING EDGES**
Investigation of rolling-up and interaction of leading-edge and trailing-edge vortex sheets on a slender delta wing
[AD-A163692] p 479 N86-24668

**TRAINING AIRCRAFT**
Use of state estimation to calculate angle-of-attack position error from flight test data
[AD-A163962] p 480 N86-24670

**TRAINING SIMULATORS**
Simulation of aircraft components for training purposes
[SAE PAPER 851965] p 496 A86-36946

**TRAJECTORY CONTROL**
Flight test trajectory controller synthesis with constrained eigenstructure assignment p 509 A86-35404

**TRAJECTORY OPTIMIZATION**
Optimal control of deterministic systems via shifted Legendre polynomials p 530 A86-34140
A preliminary study of the basic display/guidance requirements for flying near optimal trajectories
p 499 A86-35366
Maximum-range passive flight p 535 A86-36467

**TRANSATMOSPHERIC VEHICLES**
Can we develop the 1.5 million pound aerospace plane? p 515 A86-34195

**TRANSIENT RESPONSE**
Augmentor transient capability of an F100 engine equipped with a digital electronic engine control
[PAPER-11] p 505 N86-25353

**TRANSLATIONAL MOTION**
An integrated display for vertical and translational flight Eight factors affecting pilot performance
p 529 A86-36175

**TRANSMISSIONS (MACHINE ELEMENTS)**
System life and reliability modeling for helicopter transmissions
[NASA-CR-3967] p 525 N86-24990
Testing of YUH-61A helicopter transmission in NASA Lewis 2240-kW (3000-hp facility
[NASA-TP-2538] p 525 N86-24992
Generation of spiral bevel gears with zero kinematical errors and computer aided tooth contact analysis
[NASA-TM-87273] p 527 N86-25793

**TRANSMITTANCE**
LQG/LTR design of a robust flight controller for the STOL F-15
[AD-A164111] p 512 N86-24708

**TRANSONIC FLOW**
Intrablade velocity mapping in transonic fan passages of gas turbine p 474 A86-34411
A comparison of solutions of the complete potential equation and the Euler equations for the transonic flow around the DFVLR-F4-wing
[DGLR PAPER 85-121] p 475 A86-35171

Analytical tools for systematic transonic design p 477 A86-36201

Inverse method with geometric constraints for transonic aerofoil design p 477 A86-36202

Application of elliptic continuation method for transonic aerofoil design and experimental verification p 477 A86-36206

Unsteady transonic flow calculations for wing-fuselage configurations [NASA-TM-87707] p 478 N86-24657

Transonic airfoil analysis and design in nonuniform flow [NASA-CR-3991] p 480 N86-25328

Normal force characteristics of sharp nosed bodies of revolution at high angles of attack in subsonic and transonic flow p 527 N86-25555

**TRANSONIC WIND TUNNELS**

The development and calibration of an acoustic wall transonic test section [AIAA PAPER 86-0759] p 514 A86-37090

**TRANSPORT AIRCRAFT**

An application of self-tuning regulator to GLA system of an aircraft -- Gust Load Alleviation p 508 A86-34926

From wind tunnel to large aircraft [DGLR PAPER 85-088] p 487 A86-35151

Determination of wing deformation in wind tunnel models using stress measurement section technology [DGLR PAPER 85-091] p 474 A86-35154

Wing aspect ratio optimization problems for transport turbojet airplanes [SAWE PAPER 1660] p 488 A86-35206

Estimation of transport airplane aerodynamics using multiple stepwise regression p 489 A86-35385

Advanced concepts transport aircraft of 1995 [SAE PAPER 851808] p 490 A86-35438

Twin-engine transport extended range operations [SAE PAPER 851960] p 482 A86-35456

The effect of the admissible centering misalignment of a transport aircraft on its mass p 495 A86-35981

Crash response data system for the controlled impact demonstration (CID) of a full-scale transport aircraft p 500 A86-37045

In-flight measurements of wing ice shapes and wing section drag increases caused by natural icing conditions [NASA-TM-87301] p 479 N86-24667

Wind tunnel technology for the development of future commercial aircraft [NASA-TM-88390] p 514 N86-24710

KRASH dynamics analysis modeling: Transport airplane controlled impact demonstration test [DOT/FAA/CT-85/9-REV] p 483 N86-25331

AN-124 airplane's cargo-handling and automation equipment p 527 N86-25600

**TRANSPORT THEORY**

A transport model for flammability of premixed gases p 516 A86-36874

**TRANSVERSE OSCILLATION**

Calculation of the steady-state transverse vibrations of the system rotors-housing of a gas-turbine engine p 503 A86-36741

**TURBINE BLADES**

Na2SO4 induced corrosion of nickel at high temperature p 517 A86-37073

One-piece HPTR blade squealer tip [AD-D012003] p 504 N86-24698

**TURBINE ENGINES**

Application of FDI metrics to detection and isolation of sensor failures in turbine engines p 501 A86-35400

Evaluating turbine engine operating characteristics [FAA-AC-25.939-1] p 504 N86-24696

A real-time simulation evaluation of an advanced detection. Isolation and accommodation algorithm for sensor failures in turbine engines [NASA-TM-87289] p 504 N86-24697

**TURBINE INSTRUMENTS**

Practical diagnostics of aircraft gas turbines --- Russian book p 502 A86-35472

**TURBINE PUMPS**

Passive eddy-current damping as a means of vibration control in cryogenic turbomachinery [NASA-TP-2562] p 515 N86-24722

**TURBINE WHEELS**

Vibration characteristics of aircraft engine-bladed-disk assembly p 502 A86-35865

Fracture mechanics and LCF-properties of engine discs of Ti 6Al-4V, Inconel 718 and Udimet 700 P/M-HIP p 507 N86-25378

Evaluation of cyclic spin pit tests for the damage tolerance of disks p 507 N86-25379

TURBISTAN: A standard load sequence for aircraft engine discs p 526 N86-25380

An analysis of rig test disc failures p 527 N86-25381

**TURBOCOMPRESSORS**

Propulsion and Energetics Panel Working Group 14 on suitable averaging techniques in non-uniform internal flows [AD-A133968] p 503 N86-24692

TURBISTAN: A standard load sequence for aircraft engine discs p 526 N86-25380

An analysis of rig test disc failures p 527 N86-25381

**TURBOFAN ENGINES**

The superposition distortion index --- in axial flow fans of turbofan engines p 500 A86-34279

Gain-scheduled multivariable cotnrol for the GE-21 turbofan engine using the LQG/LTR methodology p 501 A86-35334

A real-time simulation evaluation of an advanced detection. Isolation and accommodation algorithm for sensor failures in turbine engines [NASA-TM-87289] p 504 N86-24697

Digital Electronic Engine Control (DEEC) Flight Evaluation in an F-15 Airplane [NASA-CP-2298] p 504 N86-25342

F-15 digital electronic engine control system description [PAPER-3] p 504 N86-25345

NASA Lewis F100 engine testing [PAPER-4] p 504 N86-25346

Airstart performance of a digital electronic engine control system on an F100 engine [PAPER-8] p 505 N86-25350

Flight evaluation of a hydromechanical backup control for the digital electronic engine control system in an F100 engine [PAPER-9] p 505 N86-25351

Backup control airstart performance on a digital electronic engine control-equipped F100-engine [PAPER-10] p 505 N86-25352

Augmentor transient capability of an F100 engine equipped with a digital electronic engine control [PAPER-11] p 505 N86-25353

Investigation of a nozzle instability on an F100 engine equipped with a digital electronic engine control [PAPER-12] p 506 N86-25354

**TURBOJET ENGINE CONTROL**

Gain-scheduled multivariable cotnrol for the GE-21 turbofan engine using the LQG/LTR methodology p 501 A86-35334

Robust detection, isolation, and accommodation for sensor failures --- in jet engine control systems p 501 A86-35402

The application of LQR synthesis techniques to the turboshaft engine control problem --- Linear Quadratic Regulator p 502 A86-35614

**TURBOJET ENGINES**

Wing aspect ratio optimization problems for transport turbojet airplanes [SAWE PAPER 1660] p 488 A86-35206

**TURBOMACHINE BLADES**

The possibility of using ion implantation for increasing the life of the compressor blades of gas-turbine aircraft engines p 522 A86-35998

**TURBOMACHINERY**

Dynamic and aeroelastic analyses of turbosystems in NASTRAN p 527 N86-25826

**TURBOPROP AIRCRAFT**

Comparison of advanced turboprop and conventional jet and propeller aircraft flyover noise annoyance - Preliminary results p 528 A86-37059

An estimate of the enroute noise of an advanced turboprop airplane NASA-TM-87302 E-3020 NAS 1.15:87302 HC A02/MF A01 [NASA-TM-87302] p 535 N86-25217

An experimental investigation of reducing advanced turboprop cabin noise by wing shielding [NASA-TM-87112] p 536 N86-25218

**TURBOPROP ENGINES**

Weakly nonlinear acoustic and shock-wave theory of the noise of advanced high-speed turbopropellers p 534 A86-35146

Cost estimating relationships for fixed wing aircraft: List price versus empty weight [AD-A164196] p 537 N86-25300

**TURBOSHAFTS**

The application of LQR synthesis techniques to the turboshaft engine control problem --- Linear Quadratic Regulator p 502 A86-35614

**TURBULENCE**

Review and evaluation of recent developments in melic inlet dynamic flow distortion prediction and computer program documentation and user's manual estimating maximum instantaneous inlet flow distortion from steady-state total pressure measurements with full, limited, or no dynamic data [NASA-CR-176765] p 525 N86-24955

**TURBULENCE EFFECTS**

Helicopter rotor noise due to ingestion of atmospheric turbulence [NASA-CR-3973] p 535 N86-25216

**TURBULENT BOUNDARY LAYER**

Analysis of a three-dimensional stationary turbulent boundary layer on the root section of a wing without allowance for compressibility p 476 A86-35991

Experimental study of the supersonic turbulent boundary layer on a blunted axisymmetric body [AD-A163736] p 479 N86-24669

An experimental investigation on location of boundary layer transition on the NACA 0012 using surface hot film gages [NASA-TM-88285] p 524 N86-24936

**TURBULENT FLOW**

Inviscid vortex-stretched turbulent shear-layer flow computed around a cranked delta wing p 475 A86-35253

Advanced boundary layer transition measurement methods for flight applications [AIAA PAPER 86-9786] p 500 A86-37083

**TURNING FLIGHT**

Studies on turning errors of the magnetic compass in flight experiments p 499 A86-34276

## U

**U.S.S.R.**

The Soviet fighter - Four decades of development p 486 A86-33989

Sukhoi frogfoot p 495 A86-36333

**UH-1 HELICOPTER**

VHF-FM communications antennas for project SINCGARS (UH-1 tail whip and cabin roof bent whip evaluation) [AD-A163561] p 524 N86-24883

**UH-60A HELICOPTER**

Process development and test evaluation of cast, HIP and heat treated titanium UH-60A M.R. Damper Bracket p 516 A86-35641

**ULTRASONIC FLAW DETECTION**

Manufacturing technology for nondestructive evaluation (NDE) system to implement Retirement For Cause (RFC) procedures for gas turbine engine components p 507 N86-25368

Advanced quantitative methods for nondestructive evaluation p 519 N86-25376

**UNSTEADY FLOW**

Analytic representation of steady and unsteady aerodynamic coefficients of modern helicopter rotors [DGLR PAPER 85-114] p 474 A86-35167

The development of laser speckle velocimetry for the measurement of vortical flow fields [AIAA PAPER 86-0768] p 523 A86-37091

Unsteady transonic flow calculations for wing-fuselage configurations [NASA-TM-87707] p 478 N86-24657

Propulsion and Energetics Panel Working Group 14 on suitable averaging techniques in non-uniform internal flows [AD-A133968] p 503 N86-24692

Experimental study of the effects of installation on singleand counter-rotation propeller noise [NASA-TP-2541] p 536 N86-26162

## V

**V/STOL AIRCRAFT**

VSTOL aircraft ice protection design considerations p 493 A86-35654

**VALVES**

On the methodology of an interactive computer-aided optimal design of a dual-valve linkage p 523 A86-36887

**VARIABLE CYCLE ENGINES**

Gain-scheduled multivariable cotnrol for the GE-21 turbofan engine using the LQG/LTR methodology p 501 A86-35334

**VECTORS (MATHEMATICS)**

The possibility of achieving high productivity with vector-pipeline processors in solving problems of mathematical physics p 531 A86-36574

**VELOCITY DISTRIBUTION**

Velocity distribution around a wing in a wind tunnel Verification of a calculation method by means of a laser anemometer p 476 A86-35925

**VELOCITY MEASUREMENT**

The development of laser speckle velocimetry for the measurement of vortical flow fields [AIAA PAPER 86-0768] p 523 A86-37091

READEX FICHE best copy available

**VERBAL COMMUNICATION**
Cockpit and cabin crew coordination and communication
[SAE PAPER 851918] p 473 A86-35448
Cockpit communication and aircraft safety - An empirical study
[SAE PAPER 851856] p 482 A86-35451
**VERTEBRAL COLUMN**
A review of the pilot backache problem in the CH113 Labrador helicopter
[AD-A164011] p 530 N86-25113
**VERTICAL FLIGHT**
An integrated display for vertical and translational flight Eight factors affecting pilot performance
p 529 A86-36175
**VERTICAL TAKEOFF AIRCRAFT**
Correlation of stability test results and analysis for the 1/5-scale V-22 aeroelastic model p 490 A86-35603
**VERY HIGH FREQUENCIES**
VHF-FM communications antennas for project SINCGARS (UH-1 tail whip and cabin roof bent whip evaluation)
[AD-A163561] p 524 N86-24883
**VIBRATION**
Testing of YUH-61A helicopter transmission in NASA Lewis 2240-kW (3000-hp facility
[NASA-TP-2538] p 525 N86-24992
**VIBRATION DAMPING**
Higher harmonic control - Vibration reduction for reduced weight --- for helicopters
[SAWE PAPER 1679] p 489 A86-35220
Adaptive flutter suppression in the presence of turbulence p 506 A86-35370
Higher harmonic control - Wind tunnel demonstration of fully effective vibratory hub force suppression
p 509 A86-35602
Process development and test evaluation of cast, HIP and heat treated titanium UH-60A M.R. Damper Bracket
p 516 A86-35641
Calculation of the steady-state transverse vibrations of the system rotors-housing of a gas-turbine engine
p 503 A86-36741
**VIBRATION ISOLATORS**
Ground vibration test of an F-16 airplane with modified decoupler pylons
[NASA-TM-87634] p 496 N86-24685
**VIBRATION MODE**
Ground vibration test of an F-16 airplane with modified decoupler pylons
[NASA-TM-87634] p 496 N86-24685
**VIBRATION TESTS**
Ground vibration test of an F-16 airplane with modified decoupler pylons
[NASA-TM-87634] p 496 N86-24685
**VISCOUS FLOW**
ALESEP. Part 2: A computer program for the analysis of leading edge separation bubbles on infinite swept wings
[NASA-CR-178015] p 479 N86-24664
**VISUAL ACCOMMODATION**
Head-up display (HUD) utility. II - Runway to HUD transitions monitoring eye focus and decision times
p 498 A86-33802
**VORTEX FLAPS**
The behaviour and performance of leading edge vortex flaps
[CAR-8601] p 479 N86-24666
Experimental assessment of vortex retaining cavity flaps for maneuverability improvement on delta wing fighter aircraft
[AD-A164104] p 497 N86-24690
**VORTEX SHEETS**
Investigation of rolling-up and interaction of leading-edge and trailing-edge vortex sheets on a slender delta wing
[AD-A163692] p 479 N86-24668
**VORTEX STREETS**
The development of laser speckle velocimetry for the measurement of vortical flow fields
[AIAA PAPER 86-0768] p 523 A86-37091
**VORTICES**
A vortex lattice method for calculating nonlinear aerodynamic characteristics of interfering airfoils
[DGLR PAPER 85-122] p 475 A86-35172
Nonlinear lift control at high speed and high angle of attack using vortex flow technology p 478 A86-37050
Vapor-screen flow-visualization experiments in the NASA Langley 0.3-m transonic cryogenic tunnel
[NASA-CR-3984] p 478 N86-24661
Investigation of rolling-up and interaction of leading-edge and trailing-edge vortex sheets on a slender delta wing
[AD-A163692] p 479 N86-24668
Experimental study of apex fences for lift enhancement on a highly swept delta wing configuration
[AD-A163877] p 512 N86-24705
Review and evaluation of recent developments in melic inlet dynamic flow distortion prediction and computer program documentation and user's manual estimating maximum instantaneous inlet flow distortion from steady-state total pressure measurements with full, limited, or no dynamic data
[NASA-CR-176765] p 525 N86-24955
Helicopter tail rotor noise analyses
[NASA-CR-176829] p 536 N86-26163

## W

**WAKES**
Unsteady heat transfer and direct comparison to steady-state measurements in a rotor-wake experiment
[NASA-TM-87220] p 524 N86-24934
**WALL FLOW**
Velocity distribution around a wing in a wind tunnel Verification of a calculation method by means of a laser anemometer p 476 A86-35925
Investigation of heat transfer in separation regions in supersonic flow in a Laval nozzle p 477 A86-36458
Characteristics of the interaction of interference and diffraction flows at supersonic velocities
p 478 A86-36459
**WARNING SYSTEMS**
Pilot evaluation of TCAS in the Long Ranger helicopter
[FAA/PM-85/30] p 486 N86-25334
**WATER TAKEOFF AND LANDING AIRCRAFT**
A note on the prediction of flying boat take-off
p 487 A86-34158
**WAVEFORMS**
Comparison of absorption and radiation boundary conditions using a time-domain three-dimensional finite difference electromagnetic computer code
[AD-A163828] p 532 N86-25149
**WEATHER FORECASTING**
AFOS (Automation of Field Operations and Services) terminal forecast decoding
[PB86-147360] p 529 N86-25954
**WEIGHT ANALYSIS**
The development of an advanced weight estimation technique for aircraft conceptual design
[SAWE PAPER 1645] p 531 A86-35204
**WEIGHT MEASUREMENT**
Requirements for second generation aircraft weighing systems
[SAWE PAPER 1669] p 513 A86-35213
**WEIGHT REDUCTION**
Impact of advanced materials on aircraft design weights - The weight improvement factor
[SAWE PAPER 1636] p 488 A86-35202
Higher harmonic control - Vibration reduction for reduced weight --- for helicopters
[SAWE PAPER 1679] p 489 A86-35220
Straining for weight savings in advanced composites
[SAWE PAPER 1685] p 516 A86-35226
Crack growth in near-alpha titanium alloys
p 526 N86-25371
**WHIP ANTENNAS**
VHF-FM communications antennas for project SINCGARS (UH-1 tail whip and cabin roof bent whip evaluation)
[AD-A163561] p 524 N86-24883
**WIND EFFECTS**
Simulation problem of controlling lateral movement of aircraft during landing approach p 534 N86-26160
**WIND SHEAR**
Development of an authoritative aid to wind shear training
[SAE PAPER 851919] p 482 A86-35449
United Airlines windshear training update
[SAE PAPER 851920] p 482 A86-35450
**WIND TUNNEL APPARATUS**
The development and calibration of an acoustic wall transonic test section
[AIAA PAPER 86-0759] p 514 A86-37090
**WIND TUNNEL MODELS**
Determination of wing deformation in wind tunnel models using stress measurement section technology
[DGLR PAPER 85-091] p 474 A86-35154
Aerodynamic performance of a 27-percent-scale AH-64 wind-tunnel model with baseline/advanced rotor blades
p 492 A86-35635
Vapor-screen flow-visualization experiments in the NASA Langley 0.3-m transonic cryogenic tunnel
[NASA-CR-3984] p 478 N86-24661
**WIND TUNNEL TESTS**
From wind tunnel to large aircraft
[DGLR PAPER 85-086] p 487 A86-35151
Roll-damping measurements on two flight body configurations in the Goettingen DFVLR-AVA transonic wind tunnel
[DGLR PAPER 85-090] p 508 A86-35153
Simulation and measurement of engine influences in a two-jet aircraft model using model engines
[DGLR PAPER 85-092] p 513 A86-35155
Helicopter test installation RoTeSt in DNW - Application and results
[DGLR PAPER 85-113] p 513 A86-35166
Higher harmonic control - Wind tunnel demonstration of fully effective vibratory hub force suppression
p 509 A86-35602
The role of scale models in the design of 'low BVI noise' rotorcraft p 534 A86-35617
Model helicopter blade slap at low tip speeds - Theoretical and experimental correlations
p 535 A86-35621
Free-tip-rotor wind-tunnel test results
p 491 A86-35628
Rotor performance characteristics from an aeroacoustic helicopter wind-tunnel test program
[NASA-TM-87681] p 479 N86-24665
Lateral and longitudinal aerodynamic stability and control parameters of the basic vortex flap research aircraft as determined from flight test data
[NASA-TM-87711] p 512 N86-24703
An experimental investigation on location of boundary layer transition on the NACA 0012 using surface hot film gages
[NASA-TM-88285] p 524 N86-24936
Flow around delta wings with broken-line leading edges p 481 N86-25560
Langley aerospace test highlights, 1985
[NASA-TM-87703] p 537 N86-26276
**WIND TUNNELS**
Velocity distribution around a wing in a wind tunnel Verification of a calculation method by means of a laser anemometer p 476 A86-35925
Current wind tunnel capability and planned improvements at the NASA Langley Research Center
[AIAA PAPER 86-0727] p 514 A86-37087
Wind tunnel technology for the development of future commercial aircraft
[NASA-TM-88390] p 514 N86-24710
**WIND TURBINES**
The importance of dynamic stall in aerodynamic modeling of the Darrieus rotor p 528 A86-36448
**WINDSHIELDS**
Frameless transparencies for aircraft cockpit enclosures
[AD-D012155] p 497 N86-24689
**WING LOADING**
An optimization procedure for a redundant wing structure
[SAWE PAPER 1684] p 521 A86-35225
Inviscid vortex-stretched turbulent shear-layer flow computed around a cranked delta wing
p 475 A86-35253
**WING ROOTS**
Analysis of a three-dimensional stationary turbulent boundary layer on the root section of a wing without allowance for compressibility p 476 A86-35991
**WING SPAN**
Calculation of the aerodynamic characteristics of three-dimensional wings of finite span in a potential incompressible flow p 476 A86-35985
**WINGS**
The induced downwash and lift on a wing of high aspect ratio in unsteady motion p 474 A86-34160
Determination of wing deformation in wind tunnel models using stress measurement section technology
[DGLR PAPER 85-091] p 474 A86-35154
A comparison of solutions of the complete potential equation and the Euler equations for the transonic flow around the DFVLR-F4-wing
[DGLR PAPER 85-121] p 475 A86-35171
Wing aspect ratio optimization problems for transport turbojet airplanes
[SAWE PAPER 1660] p 488 A86-35206
A weight method for structual boxes
[SAWE PAPER 1680] p 521 A86-35221
An experimental investigation of reducing advanced turboprop cabin noise by wing shielding
[NASA-TM-87112] p 536 N86-25218
**WORD PROCESSING**
Real-time flight test PCM data acquisition monitor
[AD-A164035] p 524 N86-24897
**WORKLOADS (PSYCHOPHYSIOLOGY)**
Computer-aided cockpit workload analysis for all weather, multirole tactical aircraft
[SAE PAPER 851876] p 499 A86-35439
**WRIST**
Theoretical three-and four-axis gimbal robot wrists
[NASA-TP-2564] p 533 N86-25168

## X

**X WING ROTORS**
X-wing potential for Navy applications
p 492 A86-35631

**X-29 AIRCRAFT**
The Grumman X-29 technology demonstrator - Technology interplay and weight evolution
[SAWE PAPER 1665] p 488 A86-35210

**XV-15 AIRCRAFT**
Tiltrotor - 'Copter and plane in one
p 490 A86-35565

Design aspects of the XV-15 advanced technology blade program p 492 A86-35630

## Y

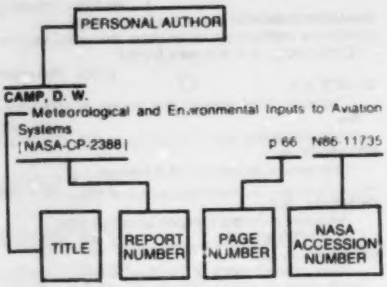
**YAW**
Use of state estimation to calculate angle-of-attack position error from flight test data
[AD-A163962] p 480 N86-24670

**YF-12 AIRCRAFT**
SR-71 digital automatic flight and inlet control system
[SAE PAPER 851977] p 509 A86-35457

**YIELD POINT**
Damage tolerant composite design development
p 524 A86-37119

# PERSONAL AUTHOR INDEX

## Typical Personal Author Index Listing



Listings in this index are arranged alphabetically by personal author. The title of the document provides the user with a brief description of the subject matter. The report number helps to indicate the type of document listed (e.g., NASA report, translation, NASA contractor report). The page and accession numbers are located beneath and to the right of the title. Under any one author's name the accession numbers are arranged in sequence with the AIAA accession numbers appearing first.

## A

**ABDELWAHAB, M.**
NASA Lewis F100 engine testing
[PAPER-4] p 504 N86-25346

**ABE, T.**
The superposition distortion index
p 500 A86-34279

**ABRAMSON, J. S.**
Applied aerodynamics of circulation control airfoils and rotors p 475 A86-35634

**ABULADZE, M. V.**
Maximum-range passive flight p 535 A86-36467

**ACHGILL, D. M.**
Adaptive fuel control testing p 502 A86-35615

**ACKER, B. H.**
Multivariable output control law design for the STOL (Short Takeoff and Landing) F-15 in landing configuration
[AD-A164516] p 498 N86-25340

**ACREE, C. W.**
RSRA flight development test in the airplane configuration p 493 A86-35653

**ADAMSON, M. J.**
An internal variable assisted formulation of moisture sorption models for polymers and composites
p 515 A86-34650

**AKHTER, M. M.**
Robust detection, isolation, and accommodation for sensor failures p 501 A86-35402

**ALBION, N.**
Higher harmonic control - Wind tunnel demonstration of fully effective vibratory hub force suppression
p 509 A86-35602

**ALCABIN, M.**
Simulation of time-control procedures for terminal area flow management p 484 A86-35369

**ALDEN, A.**
SHARP (Stationary High Altitude Relay Platform) - Rectenna and low altitude tests p 519 A86-33944

**ALESHIN, V. I.**
Parametric optimization of algorithm for estimating values of one class of unsteady random processes
p 534 N86-26161

**ALEXANDER, H. R.**
Design aspects of the XV-15 advanced technology blade program p 492 A86-35630

**ALEXANDER, J. J.**
Helicopter customer support - Are we aware of how great it can be p 536 A86-35644

**ALIMOV, A. L.**
Digital correction of the readings of an aircraft fuel-measurement system p 500 A86-36725

**ALTOZ, F. E.**
Dual mode heat exchanger
[AD-D012156] p 524 N86-24944

**AMER, K. B.**
Preliminary estimate of fatigue life for dynamic components of a new helicopter p 493 A86-35639

**AMIET, R. K.**
Helicopter rotor noise due to ingestion of atmospheric turbulence
[NASA-CR-3973] p 535 N86-25216

**ANDERSON, G. Y.**
Survey of supersonic combustion ramjet research at Langley
[AIAA PAPER 86-0159] p 503 A86-37079

NASA ACCESSION NUMBER

Listings in this index are arranged alphabetically by corporate source. The title of the document is used to provide a brief description of the subject matter. The page number and the accession number are included in each entry to assist the user in locating the abstract in the abstract section. If applicable, a report number is also included as an aid in identifying the document.

## A

**Advisory Group for Aerospace Research and Development, Neuilly-Sur-Seine (France).**

Propulsion and Energetics Panel Working Group 14 on suitable averaging techniques in non-uniform internal flows
[AD-A133968] p 503 N86-24692

Damage Tolerance Concepts for Critical Engine Components
[AGARD-CP-393] p 506 N86-25360

**Aeronautical Research Labs., Melbourne (Australia).**

Report on interest expressed in some Australian Defence Establishment products displayed at the 1985 Paris Air Show
[AD-A160807] p 498 N86-25341

**Aerostructures, Inc., Arlington, Va.**

Dynamic and aeroelastic analyses of turbosystems in NASTRAN p 527 N86-25826

**Air Force Inst. of Tech., Wright-Patterson AFB, Ohio.**

Use of state estimation to calculate angle-of-attack position error from flight test data
[AD-A163962] p 480 N86-24670

Experimental assessment of vortex retaining cavity flaps for maneuverability improvement on delta wing fighter aircraft
[AD-A164104] p 497 N86-24690

Experimental study of apex fences for lift enhancement on a highly swept delta wing configuration
[AD-A163877] p 512 N86-24705

Multivariable control law design for enhanced air combat maneuvering. F-15/STOL (Short Take-Off and Landing) derivative fighter
[AD-A164017] p 512 N86-24706

An LQG up-and away flight control design for the STOL F-15 aircraft
[AD-A164108] p 512 N86-24707

LQG/LTR design of a robust flight controller for the STOL F-15
[AD-A164111] p 512 N86-24708

Real-time flight test PCM data acquisition monitor
[AD-A164035] p 524 N86-24897

Automating knowledge acquisition in a flightline robot
[AD-A163829] p 525 N86-24997

Comparison of absorption and radiation boundary conditions using a time-domain three-dimensional finite difference electromagnetic computer code
[AD-A163828] p 532 N86-25149

Using Ada in the real-time avionics environment Issues and conclusions
[AD-A163844] p 533 N86-25151

Study of the effects of discretizing quantitative feedback theory analog control system designs
[AD-A164209] p 533 N86-25174

Pitch-location effects on dynamic stall
[AD-A164322] p 480 N86-25329

Evaluation of a frequency response technique for aircraft system identification
[AD-A164367] p 497 N86-25339

Multivariable output control law design for the STOL (Short Takeoff and Landing) F-15 in landing configuration
[AD-A164516] p 498 N86-25340

An LQG up-and away flight control design for the STOL F-15 aircraft
[AD-A164108] p 512 N86-25384

Development and evaluation of math library routines for a 1750A airborne microcomputer
[AD-A164050] p 533 N86-26030

**Air Force Systems Command, Wright-Patterson AFB, Ohio.**

Investigation of rolling-up and interaction of leading-edge and trailing-edge vortex sheets on a slender delta wing
[AD-A163692] p 479 N86-24668

**Air Force Wright Aeronautical Labs., Wright-Patterson AFB, Ohio.**

Constant-Load-Amplitude fatigue crack growth testing of cast aluminum alloys A201-T7 and A357-T6
[AD-A163494] p 518 N86-24821

Advanced quantitative methods for nondestructive evaluation p 519 N86-25376

**Akron Univ., Ohio.**

System life and reliability modeling for helicopter transmissions
[NASA-CR-3967] p 525 N86-24990

**Alphatech, Inc., Burlington, Mass.**

Application of FDI metrics to detection and isolation of sensor failures in turbine engines p 501 A86-35400

**Analytical Mechanics Associates, Inc., Mountain View, Calif.**

Design of an advanced flight planning system
p 481 A86-35365

**Army Aeromechanics Lab., Moffett Field, Calif.**

Directional handling qualities requirements for nap of the earth (NOE) tasks p 510 A86-35622

Design aspects of the XV-15 advanced technology blade program p 492 A86-35630

**Army Aviation Research and Development Command, Hampton, Va.**

Drop testing and analysis of six-foot diameter graphite-epoxy frames p 517 A86-37068

**Army Aviation Systems Command, St. Louis, Mo.**

VHF-FM communications antennas for project SINCGARS (UH-1 tail whip and cabin roof bent whip evaluation)
[AD-A163561] p 524 N86-24883

Cost estimating relationships for fixed wing aircraft: List price versus empty weight
[AD-A164196] p 537 N86-25300

**Army Propulsion Lab., Cleveland, Ohio.**

The application of LQR synthesis techniques to the turboshaft engine control problem p 502 A86-35614

**Army Structures Lab., Hampton, Va.**

Aerodynamic performance of a 27-percent-scale AH-64 wind-tunnel model with baseline/advanced rotor blades
p 492 A86-35635

Effect of fiber and matrix maximum strain on the energy absorption of composite materials p 516 A86-35640

## B

**Beech Aircraft Corp., Wichita, Kans.**

Evaluation of propfan propulsion applied to general aviation
[NASA-CR-175020] p 503 N86-24695

**Boeing Commercial Airplane Co., Seattle, Wash.**

Application of digital/electric systems to advanced technology aircraft
[SAWE PAPER 1639] p 488 A86-35203

Estimation of transport airplane aerodynamics using multiple stepwise regression p 469 A86-35385

Natural laminar flow flight experiments on a swept wing business jet-boundary layer stability analyses
[NASA-CR-3975] p 478 N86-24659

**Boeing Military Airplane Development, Seattle, Wash.**

Fireproof hydraulic brake system
[AD-A163542] p 497 N86-24688

**Boeing Vertol Co., Philadelphia, Pa.**

Free-tip-rotor wind-tunnel test results
p 491 A86-35628

Design aspects of the XV-15 advanced technology blade program p 492 A86-35630

Performance degradation of helicopters due to icing - A review p 494 A86-35668

## C

**California Univ., Los Angeles.**

An application of adaptive learning to malfunction recovery
[NASA-CR-166620] p 533 N86-25169

**Cambridge Univ. (England).**

Aspects of small crack growth p 518 N86-25370

**Chicago Univ., Ill.**

DFW (Dallas-Ft. Worth) microburst on August 2, 1985
[illegible] 176794] p 529 N86-25956

**Computer Software Management and Information Center, Athens, Ga.**

Fourteenth NASTRAN Users' Colloquium
[NASA-CP-2419] p 527 N86-25823

**Continuum Dynamics, Inc., Princeton, N. J.**

A new approach to the free wake problem for hovering rotors p 475 A86-35633

**Cornell Univ., Ithaca, N.Y.**

A comparative study of tail rotor noise mechanisms
p 534 A86-35618

Helicopter tail rotor noise analyses
[NASA-CR-176829] p 536 N86-26163

**Cranfield Inst. of Tech., Bedford (England).**

The behaviour and performance of leading edge vortex flaps
[CAR-8601] p 479 N86-24666

Pressure based separation in the upper airspace
[CAR-8614] p 486 N86-24679

## D

**Defence and Civil Inst. of Environmental Medicine, Downsview (Ontario).**

A review of the pilot backache problem in the CH113 Labrador helicopter
[AD-A164011] p 530 N86-25113

**Department of the Air Force, Washington, D.C.**

Frameless transparencies for aircraft cockpit enclosures
[AD-D012155] p 497 N86-24689

One-piece HPTR blade squealer tip
[AD-D012003] p 504 N86-24698

Dual mode heat exchanger
[AD-D012156] p 524 N86-24944

Laser beam duct pressure controller system
[AD-D012017] p 525 N86-24984

**Douglas Aircraft Co., Inc., Long Beach, Calif.**

Guidance studies for curved, descending approaches using the Microwave Landing System (MLS)
[NASA-CR-178030] p 486 N86-25335

**Draper (Charles Stark) Lab., Inc., Cambridge, Mass.**

The evaluation of the OSGLR algorithm for restructurable controls
[NASA-CR-178083] p 485 N86-24678

**Drexel Univ., Philadelphia, Pa.**

Materials for emergency repair of runways
[AD-A164225] p 514 N86-25385

## E

**ESDU International Ltd., London (England).**

Increments in aerofoil maximum lift coefficient due to deployment of various high-lift devices
[ESDU-85033] p 480 N86-25325

Conversion of air-data system pressure errors into height and speed corrections
[ESDU-85036] p 497 N86-25338

## F

**Federal Aviation Administration, Atlantic City, N.J.**

Simulation of time-control procedures for terminal area flow management p 484 A86-35369

**Federal Aviation Administration, Washington, D.C.**

Evaluating turbine engine operating characteristics
[FAA-AC-25.939-1] p 504 N86-24696

Pilot evaluation of TCAS in the Long Ranger helicopter
[FAA/PM-85/30] p 486 N86-25334

**Federal Aviation Agency, Atlantic City, N.J.**

Computed centerline MLS (Microwave Landing System) approach demonstration at Washington National Airport
[AD-A163722] p 486 N86-24681

**Fiat Research Center, Orbassano, Turin (Italy).**

Small defect characterization in powder metallurgy materials p 526 N86-25373

**Florida State Univ., Tallahassee.**

The development of laser speckle velocimetry for the measurement of vortical flow fields
[AIAA PAPER 86-0768] p 523 A86-37091

## G

**General Electric Co., Cincinnati, Ohio.**

Evaluation of capillary reinforced composites
[NASA-CR-175061] p 517 N86-24760

**General Electric Co., Lynn, Mass.**

The application of LQR synthesis techniques to the turboshaft engine control problem p 502 A86-35614

**General Motors Corp., Detroit, Mich.**

Model helicopter blade slap at low tip speeds - Theoretical and experimental correlations
p 535 A86-35621

**Georgetown Univ., Washington, D.C.**

A research program in active control/aeroelasticity
[NASA-CR-176773] p 511 N86-24702

## I

**Industrieanlagen-Betriebsgesellschaft m.b.H., Ottobrunn (West Germany).**

Fracture mechanics and LCF-properties of engine discs of Ti 6Al-4V, Inconel 718 and Udimet 700 P/M-HIP
p 507 N86-25378

**Informatics General Corp., Moffett Field, Calif.**

Advanced concepts transport aircraft of 1995
[SAE PAPER 851808] p 490 A86-35438

**Integrated Systems, Inc., Palo Alto, Calif.**

Flight test trajectory controller synthesis with constrained eigenstructure assignment p 509 A86-35404

**Irwin (Arthur S.) Co., Inc., Bemus Point, N.Y.**

Review and critical analysis: Rolling-element bearings for system life and reliability
[NASA-CR-174710] p 525 N86-24991

## J

**Jet Propulsion Lab., California Inst. of Tech., Pasadena.**

High resolution millimeter-wave imaging sensor
p 498 A86-33590

**Joint Inst. for Advancement of Flight Sciences, Hampton, Va.**

Estimation of transport airplane aerodynamics using multiple stepwise regression p 489 A86-35385

**Joint Publications Research Service, Arlington, Va.**

Hypersonic flow around a wing at large angles of attack with detached compression jump p 480 N86-25534

Normal force characteristics of sharp nosed bodies of revolution at high angles of attack in subsonic and transonic flow p 527 N86-25555

Supersonic flow around blunt perforated shields
p 480 N86-25558

Flow around delta wings with broken-line leading edges p 481 N86-25560

Movement of flexible wing at supersonic velocity under influence of random gust p 481 N86-25562

AN-124 airplane's cargo-handling and automation equipment p 527 N86-25600

Information on new AN-124 giant cargo plane
p 498 N86-25601

Data on MI-26 helicopter p 498 N86-25602

Role of optimization methods in improvement of flight control for airplanes p 513 N86-25603

Simulation problem of controlling lateral movement of aircraft during landing approach p 534 N86-26160

Parametric optimization of algorithm for estimating values of one class of unsteady random processes
p 534 N86-26161

## K

**Kansas Univ. Center for Research, Inc., Lawrence.**

Review and evaluation of recent developments in melic inlet dynamic flow distortion prediction and computer program documentation and user's manual estimating maximum instantaneous inlet flow distortion from steady-state total pressure measurements with full, limited, or no dynamic data
[NASA-CR-176765] p 525 N86-24955

Transonic airfoil analysis and design in nonuniform flow
[NASA-CR-3991] p 480 N86-25328

**Kentron International, Inc., Hampton, Va.**

Weights assessment for orbit-on-demand vehicles
[SAWE PAPER 1674] p 515 A86-35217

## L

**Lockheed-California Co., Burbank.**

KRASH dynamics analysis modeling: Transport airplane controlled impact demonstration test
[DOT/FAA/CT-85/9-REV] p 483 N86-25331

**Lockheed-Georgia Co., Marietta.**

Advanced concepts transport aircraft of 1995
[SAE PAPER 851808] p 490 A86-35438

## M

**Massachusetts Inst. of Tech., Cambridge.**

Helicopter gust alleviation, attitude stabilization, and vibration alleviation using individual-blade-control through a conventional swash plate p 510 A86-35604

Model helicopter blade slap at low tip speeds - Theoretical and experimental correlations
p 535 A86-35621

Thermal-mechanical fatigue behavior of nickel-base superalloys
[NASA-CR-175048] p 518 N86-24818

**Massachusetts Inst. of Tech., Lexington.**

Pilot evaluation of TCAS in the Long Ranger helicopter
[FAA/PM-85/30] p 486 N86-25334

**Michigan Univ., Ann Arbor.**

Head-up display (HUD) utility. II - Runway to HUD transitions monitoring eye focus and decision times
p 498 A86-33802

**Minnesota Univ., Minneapolis.**

Application of eigenspace techniques to design of aircraft control systems p 508 A86-35360

## N

**National Aeronautics and Space Administration, Washington, D.C.**

Selections from Flug Revue und Flugwelt International. A. On the border of Time-hypersonic flight. B. NASA programs pave the way for the hypersonic aircraft. C. Shuttle flight 61-B; construction in space. D. Faster than a bullet; hypersonic military aircraft
[NASA-TM-88418] p 474 N86-24852

Eigenstructure assignment and its application in design of flight control systems
[NASA-TM-88411] p 511 N86-24701

Wind tunnel technology for the development of future commercial aircraft
[NASA-TM-88390] p 514 N86-24710

An experimental investigation on location of boundary layer transition on the NACA 0012 using surface hot film gages
[NASA-TM-88285] p 524 N86-24936

**National Aeronautics and Space Administration. Ames Research Center, Moffett Field, Calif.**

Head-up display (HUD) utility. II - Runway to HUD transitions monitoring eye focus and decision times
p 498 A86-33802

An internal variable assisted formulation of moisture sorption models for polymers and composites
p 515 A86-34860

Simulation of time-control procedures for terminal area flow management p 484 A86-35369

High-speed, automatic controller design considerations for integrating array processor, multi-microprocessor, and host computer system architectures p 531 A86-35409

Advanced concepts transport aircraft of 1995
[SAE PAPER 851808] p 490 A86-35438

Tiltrotor - 'Copter and plane in one
p 490 A86-35585

Development and flight test of a helicopter, X-band, portable precision landing system concept
p 485 A86-35608

Directional handling qualities requirements for nap of the earth (NOE) tasks p 510 A86-35622

Free-tip-rotor wind-tunnel test results
p 491 A86-35628

Design aspects of the XV-15 advanced technology blade program p 492 A86-35630

RSRA flight development test in the airplane configuration p 493 A86-35653

The influence of sampling rate on the dynamics and control of aeronautical systems p 511 A86-37061

The development of laser speckle velocimetry for the measurement of vortical flow fields
[AIAA PAPER 86-0768] p 523 A86-37091

Swashplate control system
[NASA-CASE-ARC-11633-1] p 511 N86-24700

**National Aeronautics and Space Administration. Dryden (Hugh L.) Flight Research Center, Edwards, Calif.**

An engineering approach to the use of expert systems technology in avionics applications
[NASA-TM-88263] p 497 N86-24687

Digital Electronic Engine Control (DEEC) Flight Evaluation in an F-15 Airplane
[NASA-CP-2298] p 504 N86-25342

Digital electronic engine control F-15 overview
[PAPER-1] p 504 N86-25343

Digital electronic engine control history
[PAPER-2] p 504 N86-25344

F-15 digital electronic engine control system description
[PAPER-3] p 504 N86-25345

NASA Lewis F100 engine testing
[PAPER-4] p 504 N86-25346

Effects of inlet distortion on a static pressure probe mounted on the engine hub in an F-15 airplane
[PAPER-5] p 505 N86-25347

Flight testing the digital electronic engine control in the F-15 airplane
[PAPER-6] p 505 N86-25348

Digital electronic engine control fault detection and accommodation flight evaluation
[PAPER-7] p 505 N86-25349

Airstart performance of a digital electronic engine control system on an F100 engine
[PAPER-8] p 505 N86-25350

Flight evaluation of a hydromechanical backup control for the digital electronic engine control system in an F100 engine
[PAPER-9] p 505 N86-25351

Backup control airstart performance on a digital electronic engine control-equipped F100-engine
[PAPER-10] p 505 N86-25352

Augmentor transient capability of an F100 engine equipped with a digital electronic engine control
[PAPER-11] p 505 N86-25353

Investigation of a nozzle instability on an F100 engine equipped with a digital electronic engine control
[PAPER-12] p 506 N86-25354

Real-time in-flight thrust calculation on a digital electronic engine control-equipped F100 engine in an F-15 airplane
[PAPER-13] p 506 N86-25355

Control technology for future aircraft propulsion systems
[PAPER-14] p 506 N86-25356

**National Aeronautics and Space Administration. Flight Research Center, Edwards, Calif.**

Flight test trajectory controller synthesis with constrained eigenstructure assignment p 509 A86-35404

Summary of results of NASA F-15 flight research program
[AIAA PAPER 86-9761] p 496 A86-37064

**National Aeronautics and Space Administration. Langley Research Center, Hampton, Va.**

An airborne multiple-beam 1.4 GHz pushbroom microwave radiometer p 498 A86-33583

Weights assessment for orbit-on-demand vehicles
[SAWE PAPER 1674] p 515 A86-35217

A preliminary study of the basic display/guidance requirements for flying near optimal trajectories
p 499 A86-35366

Estimation of transport airplane aerodynamics using multiple stepwise regression p 489 A86-35385

Aerodynamic performance of a 27-percent-scale AH-64 wind-tunnel model with baseline/advanced rotor blades p 492 A86-35635

Effect of fiber and matrix maximum strain on the energy absorption of composite materials p 516 A86-35640

Crash response data system for the controlled impact demonstration (CID) of a full-scale transport aircraft p 500 A86-37045

Nonlinear lift control at high speed and high angle of attack using vortex flow technology p 478 A86-37050

Comparison of advanced turboprop and conventional jet and propeller aircraft flyover noise annoyance - Preliminary results p 526 A86-37059

Implicit, vectorizable schemes for the flux-difference split, three-dimensional Navier-Stokes equations p 523 A86-37067

Drop testing and analysis of six-foot diameter graphite-epoxy frames p 517 A86-37068

Adaptive control robustness in flexible aircraft application p 511 A86-37070

Techniques for increasing the update rate of real-time dynamic computer graphic displays p 523 A86-37072

Survey of supersonic combustion ramjet research at Langley
[AIAA PAPER 86-0159] p 503 A86-37079

Advanced boundary layer transition measurement methods for flight applications
[AIAA PAPER 86-9786] p 500 A86-37083

Current wind tunnel capability and planned improvements at the NASA Langley Research Center
[AIAA PAPER 86-0727] p 514 A86-37087

Unsteady transonic flow calculations for wing-fuselage configurations
[NASA-TM-87707] p 478 N86-24657

Nonisentropic unsteady three dimensional small disturbance potential theory
[NASA-TM-87726] p 479 N86-24663

Rotor performance characteristics from an aeroacoustic helicopter wind-tunnel test program
[NASA-TM-87661] p 479 N86-24665

Loads and motions of an F-106B flying through thunderstorms
[NASA-TM-87671] p 483 N86-24672

Ice detector
[NASA-CASE-LAR-13403-1] p 483 N86-24673

Ground vibration test of an F-16 airplane with modified decoupler pylons
[NASA-TM-87634] p 496 N86-24685

Lateral and longitudinal aerodynamic stability and control parameters of the basic vortex flap research aircraft as determined from flight test data
[NASA-TM-87711] p 512 N86-24703

Theoretical three-and four-axis gimbal robot wrists
[NASA-TP-2564] p 533 N86-25168

Aircraft Noise Prediction Program theoretical manual: Propeller aerodynamics and noise
[NASA-TM-83199-PT-3] p 536 N86-25220

Experimental study of the effects of installation on singleand counter-rotation propeller noise
[NASA-TP-2541] p 536 N86-26162

Langley aerospace test highlights, 1985
[NASA-TM-87703] p 537 N86-26276

**National Aeronautics and Space Administration. Lewis Research Center, Cleveland, Ohio.**

The application of LQR synthesis techniques to the turboshaft engine control problem p 502 A86-35614

The aerodynamics of rotor blades with ice shapes accreted in hover and in level flight p 476 A86-35655

The performance characteristics of simulated ice on rotorcraft airfoils p 482 A86-35656

Performance degradation of helicopters due to icing - A review p 494 A86-35668

Flow field and near and far sound field of a subsonic jet p 476 A86-35855

$Na_2SO_4$ induced corrosion of nickel at high temperature p 517 A86-37073

A numerical analysis applied to high angle of attack three-dimensional inlets
[NASA-TM-87298] p 478 N86-24658

In-flight measurements of wing ice shapes and wing section drag increases caused by natural icing conditions
[NASA-TM-87301] p 479 N86-24667

Low-speed performance of an axisymmetric, mixed-compression, supersonic inlet with auxiliary inlets
[NASA-TP-2557] p 503 N86-24694

A real-time simulation evaluation of an advanced detection. Isolation and accommodation algorithm for sensor failures in turbine engines
[NASA-TM-87289] p 504 N86-24697

Passive eddy-current damping as a means of vibration control in cryogenic turbomachinery
[NASA-TP-2562] p 515 N86-24722

Unsteady heat transfer and direct comparison to steady-state measurements in a rotor-wake experiment
[NASA-TM-87220] p 524 N86-24934

Testing of YUH-61A helicopter transmission in NASA Lewis 2240-kW (3000-hp facility
[NASA-TP-2538] p 525 N86-24992

An estimate of the enroute noise of an advanced turboprop airplane NASA-TM-87302 E-3020 NAS 1.15:87302 HC A02/MF A01
[NASA-TM-87302] p 535 N86-25217

An experimental investigation of reducing advanced turboprop cabin noise by wing shielding
[NASA-TM-87112] p 536 N86-25218

Generation of spiral bevel gears with zero kinematical errors and computer aided tooth contact analysis
[NASA-TM-87273] p 527 N86-25793

**National Aeronautics and Space Administration. Marshall Space Flight Center, Huntsville, Ala.**

Characteristics pertaining to a stiffness cross-coupled Jeffcott model
[ASME PAPER 85-DET-144] p 523 A86-37071

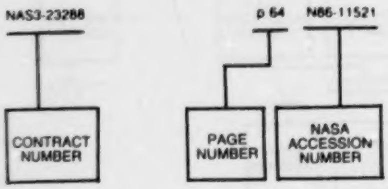
# CONTRACT NUMBER INDEX

### Typical Contract Number Index Listing



Listings in this index are arranged alphanumerically by contract number. Under each contract number, the accession numbers denoting documents that have been produced as a result of research done under that contract are arranged in ascending order with the AIAA accession numbers appearing first. The accession number denotes the number by which the citation is identified in the abstract section. Preceding the accession number is the page number on which the citation may be found.

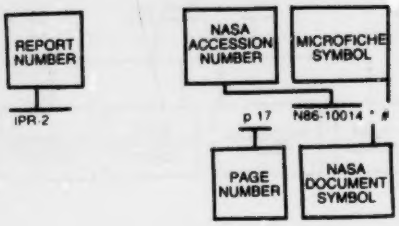
# REPORT NUMBER INDEX

### Typical Report Number Index Listing



Listings in this index are arranged alphanumerically by report number. The page number indicates the page on which the citation is located. The accession number denotes the number by which the citation is identified. An asterisk (*) indicates that the item is a NASA report. A pound sign (#) indicates that the item is available on microfiche.

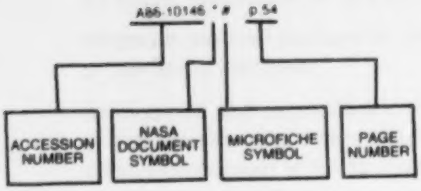
# ACCESSION NUMBER INDEX

### Typical Accession Number Index Listing



Listings in this index are arranged alphanumerically by accession number. The page number listed to the right indicates the page on which the citation is located. An asterisk (*) indicates that the item is a NASA report. A pound sign (#) indicates that the item is available on microfiche.

# AVAILABILITY OF CITED PUBLICATIONS

## IAA ENTRIES (A86-10000 Series)

Publications announced in *IAA* are available from the AIAA Technical Information Service as follows: Paper copies of accessions are available at $10.00 per document (up to 50 pages), additional pages $0.25 each. Microfiche(1) of documents announced in *IAA* are available at the rate of $4.00 per microfiche on demand. Standing order microfiche are available at the rate of $1.45 per microfiche for *IAA* source documents and $1.75 per microfiche for AIAA meeting papers.

Minimum air-mail postage to foreign countries is $2.50. All foreign orders are shipped on payment of pro-forma invoices.

All inquiries and requests should be addressed to: Technical Information Service, American Institute of Aeronautics and Astronautics, 555 West 57th Street, New York, NY 10019. Please refer to the accession number when requesting publications.

## STAR ENTRIES (N86-10000 Series)

One or more sources from which a document announced in *STAR* is available to the public is ordinarily given on the last line of the citation. The most commonly indicated sources and their acronyms or abbreviations are listed below. If the publication is available from a source other than those listed, the publisher and his address will be displayed on the availability line or in combination with the corporate source line.

Avail: NTIS. Sold by the National Technical Information Service. Prices for hard copy (HC) and microfiche (MF) are indicated by a price code preceded by the letters HC or MF in the *STAR* citation. Current values for the price codes are given in the tables on NTIS PRICE SCHEDULES.

Documents on microfiche are designated by a pound sign (#) following the accession number. The pound sign is used without regard to the source or quality of the microfiche.

Initially distributed microfiche under the NTIS SRIM (Selected Research in Microfiche) is available at greatly reduced unit prices. For this service and for information concerning subscription to NASA printed reports, consult the NTIS Subscription Section, Springfield, Va. 22161.

NOTE ON ORDERING DOCUMENTS: When ordering NASA publications (those followed by the * symbol), use the N accession number. NASA patent applications (only the specifications are offered) should be ordered by the US-Patent-Appl-SN number. Non-NASA publications (no asterisk) should be ordered by the AD, PB, or other *report* number shown on the last line of the citation, not by the N accession number. It is also advisable to cite the title and other bibliographic identification.

Avail: SOD (or GPO). Sold by the Superintendent of Documents, U.S. Government Printing Office, in hard copy. The current price and order number are given following the availability line. (NTIS will fill microfiche requests, as indicated above, for those documents identified by a # symbol.)

Avail: NASA Public Document Rooms. Documents so indicated may be examined at or purchased from the National Aeronautics and Space Administration, Public Document Room (Room 126), 600 Independence Ave., S.W., Washington, D.C. 20546, or public document rooms located at each of the NASA research centers, the NASA Space Technology Laboratories, and the NASA Pasadena Office at the Jet Propulsion Laboratory.

(1) A microfiche is a transparent sheet of film, 105 by 148 mm in size containing as many as 60 to 98 pages of information reduced to micro images (not to exceed 26:1 reduction).

Avail: DOE Depository Libraries. Organizations in U.S. cities and abroad that maintain collections of Department of Energy reports, usually in microfiche form, are listed in *Energy Research Abstracts.* Services available from the DOE and its depositories are described in a booklet, *DOE Technical Information Center - Its Functions and Services* (TID-4660), which may be obtained without charge from the DOE Technical Information Center.

Avail: Univ. Microfilms. Documents so indicated are dissertations selected from *Dissertation Abstracts* and are sold by University Microfilms as xerographic copy (HC) and microfilm. All requests should cite the author and the Order Number as they appear in the citation.

Avail: USGS. Originals of many reports from the U.S. Geological Survey, which may contain color illustrations, or otherwise may not have the quality of illustrations preserved in the microfiche or facsimile reproduction, may be examined by the public at the libraries of the USGS field offices whose addresses are listed in this introduction. The libraries may be queried concerning the availability of specific documents and the possible utilization of local copying services, such as color reproduction.

Avail: HMSO. Publications of Her Majesty's Stationery Office are sold in the U.S. by Pendragon House, Inc. (PHI), Redwood City, California. The U.S. price (including a service and mailing charge) is given, or a conversion table may be obtained from PHI.

Avail: BLL (formerly NLL): British Library Lending Division, Boston Spa, Wetherby, Yorkshire, England. Photocopies available from this organization at the price shown. (If none is given, inquiry should be addressed to the BLL.)

Avail: Fachinformationszentrum, Karlsruhe. Sold by the Fachinformationszentrum Energie, Physik, Mathematik GMBH, Eggenstein Leopoldshafen, Federal Republic of Germany, at the price shown in deutschmarks (DM).

Avail: Issuing Activity, or Corporate Author, or no indication of availability. Inquiries as to the availability of these documents should be addressed to the organization shown in the citation as the corporate author of the document.

Avail: US Patent and Trademark Office. Sold by Commissioner of Patents and Trademarks, U.S. Patent and Trademark Office, at the standard price of $1.50 each, postage free.

Avail: ESDU. Pricing information on specific data, computer programs, and details on ESDU topic categories can be obtained from ESDU International Ltd. Requesters in North America should use the Virginia address while all other requesters should use the London address.

Avail: (US Sales Only). These foreign documents are available to users within the United States from the National Technical Information Service (NTIS). They are available to users outside the United States through the International Nuclear Information Service (INIS) representative in their country, or by applying directly to the issuing organization.

Other availabilities: If the publication is available from a source other than the above, the publisher and his address will be displayed entirely on the availability line or in combination with the corporate author line.

## GENERAL AVAILABILITY

All publications abstracted in this bibliography are available to the public through the sources as indicated in the *STAR Entries* and *IAA Entries* sections. It is suggested that the bibliography user contact his own library or other local libraries prior to ordering any publication inasmuch as many of the documents have been widely distributed by the issuing agencies, especially NASA.

## PUBLIC COLLECTIONS OF NASA DOCUMENTS

**DOMESTIC:** NASA and NASA-sponsored documents and a large number of aerospace publications are available to the public for reference purposes at the library maintained by the American Institute of Aeronautics and Astronautics, Technical Information Service, 555 West 57th Street, 12th Floor, New York, New York 10019.

**EUROPEAN:** An extensive collection of NASA and NASA-sponsored publications is maintained by the British Library Lending Division, Boston Spa, Wetherby, Yorkshire, England for public access. The British Library Lending Division also has available many of the non-NASA publications cited in *STAR*. European requesters may purchase facsimile copy or microfiche of NASA and NASA-sponsored documents, those identified by both the symbols # and * from ESA — Information Retrieval Service European Space Agency, 8-10 rue Mario-Nikis, 75738 CEDEX 15, France.

### FEDERAL DEPOSITORY LIBRARY PROGRAM

In order to provide the general public with greater access to U.S. Government publications, Congress established the Federal Depository Library Program under the Government Printing Office (GPO), with 50 regional depositories responsible for permanent retention of material, inter-library loan, and reference services. At least one copy of nearly every NASA and NASA-sponsored publication, either in printed or microfiche format, is received and retained by the 50 regional depositories. A list of the regional GPO libraries, arranged alphabetically by state, appears on the inside back cover. These libraries are *not* sales outlets. A local library can contact a Regional Depository to help locate specific reports, or direct contact may be made by an individual.

## STANDING ORDER SUBSCRIPTIONS

NASA SP-7037 and its supplements are available from the National Technical Information Service (NTIS) on standing order subscription as PB 86-914100 at the price of $7.00 domestic and $14.00 foreign—includes annual index. Standing order subscriptions do not terminate at the end of a year, as do regular subscriptions, but continue indefinitely unless specifically terminated by the subscriber.

# FEDERAL DEPOSITORY LIBRARY PROGRAM

The Federal Depository Library Program provides Government publications to designated libraries throughout the United States. The Regional Depository Libraries listed below receive and retain at least one copy of nearly every Federal Government publication, either in printed or microfilm form, for use by the general public. These libraries provide reference services and inter-library loans; however, they are *not* sales outlets. You may wish to ask your local library to contact a Regional Depository to help you locate specific publications, or you may contact the Regional Depository yourself.

# INTRODUCTION

This issue of *Aeronautical Engineering -- A Continuing Bibliography* (NASA SP-7037) lists 517 reports, journal articles and other documents originally announced in September 1986 in *Scientific and Technical Aerospace Reports (STAR)* or in *International Aerospace Abstracts (IAA)*.

The coverage includes documents on the engineering and theoretical aspects of design, construction, evaluation, testing, operation, and performance of aircraft (including aircraft engines) and associated components, equipment, and systems. It also includes research and development in aerodynamics, aeronautics, and ground support equipment for aeronautical vehicles.

Each entry in the bibliography consists of a standard bibliographic citation accompanied in most cases by an abstract. The listing of the entries is arranged by the first nine *STAR* specific categories and the remaining *STAR* major categories. This arrangement offers the user the most advantageous breakdown for individual objectives. The citations include the original accession numbers from the respective announcement journals. The *IAA* items will precede the *STAR* items within each category

Seven indexes -- subject, personal author, corporate source, foreign technology, contract number, report number, and accession number -- are included.

An annual cummulative index will be published.

# TABLE OF CONTENTS

Page

**Category 01 Aeronautics (General)** 539

**Category 02 Aerodynamics** 541
Includes aerodynamics of bodies, combinations, wings, rotors, and control surfaces; and internal flow in ducts and turbomachinery.

**Category 03 Air Transportation and Safety** 566
Includes passenger and cargo air transport operations; and aircraft accidents.

**Category 04 Aircraft Communications and Navigation** 571
Includes digital and voice communication with aircraft; air navigation systems (satellite and ground based); and air traffic control.

**Category 05 Aircraft Design, Testing and Performance** 575
Includes aircraft simulation technology.

**Category 06 Aircraft Instrumentation** 588
Includes cockpit and cabin display devices; and flight instruments.

**Category 07 Aircraft Propulsion and Power** 590
Includes prime propulsion systems and systems components, e.g., gas turbine engines and compressors; and on-board auxiliary power plants for aircraft.

**Category 08 Aircraft Stability and Control** 593
Includes aircraft handling qualities; piloting; flight controls; and autopilots.

**Category 09 Research and Support Facilities (Air)** 596
Includes airports, hangars and runways; aircraft repair and overhaul facilities; wind tunnels; shock tube facilities; and engine test blocks.

**Category 10 Astronautics** 600
Includes astronautics (general); astrodynamics; ground support systems and facilities (space); launch vehicles and space vehicles; space transportation; spacecraft communications, command and tracking; spacecraft design, testing and performance; spacecraft instrumentation; and spacecraft propulsion and power.

**Category 11 Chemistry and Materials** 601
Includes chemistry and materials (general); composite materials; inorganic and physical chemistry; metallic materials; nonmetallic materials; and propellants and fuels.

**Category 12 Engineering** 605

Includes engineering (general); communications; electronics and electrical engineering; fluid mechanics and heat transfer; instrumentation and photography; lasers and masers; mechanical engineering; quality assurance and reliability; and structural mechanics.

**Category 13 Geosciences** 613

Includes geosciences (general); earth resources; energy production and conversion; environment pollution; geophysics; meteorology and climatology; and oceanography.

**Category 14 Life Sciences** N.A.

Includes sciences (general); aerospace medicine; behavioral sciences; man/system technology and life support; and planetary biology.

**Category 15 Mathematics and Computer Sciences** 617

Includes mathematical and computer sciences (general); computer operations and hardware; computer programming and software; computer systems; cybernetics; numerical analysis; statistics and probability; systems analysis; and theoretical mathematics.

**Category 16 Physics** 619

Includes physics (general); acoustics; atomic and molecular physics; nuclear and high-energy physics; optics; plasma physics; solid-state physics; and thermodynamics and statistical physics.

**Category 17 Social Sciences** 620

Includes social sciences (general); administration and management; documentation and information science; economics and cost analysis; law and political science; and urban technology and transportation.

**Category 18 Space Sciences** N.A.

Includes space sciences (general); astronomy; astrophysics; lunar and planetary exploration; solar physics; and space radiation.

**Category 19 General** 620

The aircraft industry has long been concerned with the increase of drag on airplanes due to fouling of the wings by insects. The present research studied the effects of surface energy and surface roughness on the phenomenon of insect sticking. Aluminum plates of different roughnesses were coated with thin films of polymers with varying surface energies. The coated plates were attached to a custom jig and mounted on top of an automobile for insect collection. Contact angle measurements, X-ray photoelectron spectroscopy and specular reflectance infrared spectroscopy were used to characterize the surface before and after the insect impact experiments. Scanning electron microscopy showed the topography of insect residues on the exposed plates. Moments were calculated in order to find a correlation between the parameters studied and the amount of bugs collected on the plates. An effect of surface energy on the sticking of insect residues was demonstrated.

**CONFERENCE DATE**

A previously developed technique for selecting a design space for efficient supersonic wings is reviewed; this design-space concept is expanded to include thickness and camber effects and is evaluated for cambered wings at high-lift conditions. The original design-space formulation was based on experimental upper-surface and lower-surface normal-force characteristics for flat, uncambered delta wings; it is shown that these general characteristics hold for various thickness distributions and for various amounts of leading-edge camber. The original design-space formulation was also based on the assumption that the combination of Mach number and leading-edge sweep which would produce an equal division of flat-wing lift between the upper and lower surface would also be the proper combination to give the best cambered-wing performance. Using drag-due-to-lift factor as a measure of performance, for high-lift conditions cambered-wing performance is shown to significantly increase as conditions approach the design space; this correlation is demonstrated for both subcritical and supercritical flows.

## AERONAUTICS (GENERAL)

**A86-38356**
**PILOT'S ASSOCIATE - WHAT SHOULD IT DO?**
R. L. STROM (Rockwell International Corp., Pittsburgh, PA) SAE, Aerospace Technology Conference and Exposition, Long Beach, CA, Oct. 14-17, 1985. 5 p.
(SAE PAPER 851890)

This paper describes the analysis required to select which crew decisions and actions should be assigned to an airborne computer system, capable of handling massive amounts of data and accomplishing speeds of analysis, calculation, and decision beyond human capability. Such a system is referred to as a Pilot's Associate (PA). The required processing system would probably utilize a combination of Artificial Intelligence (AI) concepts and deterministic algorithms. To determine what functions must be accomplished by the combination of the aircraft crew and an expert system requires a top-down analysis of required functions, from which can be derived decision and action requirements, data processing requirements and allocations of performance between the PA and the crew. **NEXT GENERATION AIRCRAFT STRUCTURES - THE NEED FOR CO-ORDINATED CANADIAN R & D PROGRAMS**
J. THOMPSON (CASI, Structures and Materials Section, Ottawa, Canada) Canadian Aeronautics and Space Journal (ISSN 0008-2821), vol. 32, March 1986, p. 50-53.

The directions which Canadian R & D in aircraft structures are expected to take over the next 25 yr are discussed. Current programs are targeted at developing composite secondary structures which can be certified for regular use, particularly in the DHC-7 and DHC-8 aircraft. Near- and mid-term research will examine carbon-fiber, aramid, aramid/aluminum hybrids, aluminum lithium alloys, and powder metallurgy ingot aluminum alloys, mainly for commuter aircraft. The parts which will receive the most attention are wings and flaps, empennages, fuselages and flight control surfaces. The efforts will require the development of standardized analytical and numerical tools, NDE testing methods and test procedures, extensive material characterization studies, and funding and performance of components testing programs. It is notable that commuter aircraft primary structures will be required to be as resistant to impact damage from, e.g., birds, as typical modern larger passenger aircraft. M.S.K.

**A86-39570#**
**COST-EFFECTIVE REMOTE-SITE TESTING**
M. P. ROSEMEYER (De Havilland Aircraft of Canada, Ltd., Downsview) Canadian Aeronautics and Space Journal (ISSN 0008-2821), vol. 32, March 1986, p. 75-80.

The DASH-8 aircraft was flight-tested using short-term trials at remote sites in order to control testing costs and accelerate the test program. Additionally, data acquisition and analysis were performed using computers and instrumentation used with the DASH-7 aircraft, along with 10 new commercially-available microcomputers. The flight tests were distributed among two sites in Arizona and one in Michigan, with most test trips lasting shorter than 6 weeks, an interval regarded as optimum for a maximum sustained team effort. Cooperation was gained with the local ATC in order to coordinate the efforts with normal traffic patterns and to avoid any conflicts between required testing and ATC priorities. Short tabulations are provided of the man-hours, travel times, and test-time cost savings achieved while accomplishing the flight tests needed for certification. Finally, the success of efforts to design the DASH-8 right the first time are emphasized, since only three structural changes were identified as necessary and implemented during the development period. **SUMMARY OF RESULTS OF NASA F-15 FLIGHT RESEARCH PROGRAM**
F. W. BURCHAM, JR., G. A. TRIPPENSEE, D. F. FISHER, and T. W. PUTNAM Apr. 1986 34 p refs Presented at the AIAA 3rd Flight Testing Conference, Las Vegas, Nevada, 2-4 Apr. 1986
(NASA-TM-86811; H-1341; NAS 1.15:86811; AIAA-86-9761)
Avail: NTIS HC A03/MF A01 CSCL 01B

NASA conducted a multidisciplinary flight research program on the F-15 airplane. The program began in 1976 when two preproduction airplanes were obtained from the U.S. Air Force. Major projects involved stability and control, handling qualities, propulsion, aerodynamics, propulsion controls, and integrated propulsion-flight controls. Several government agencies and aerospace contractors were involved. In excess of 330 flights were flown, and over 85 papers and reports were published. This document describes the overall program, the projects, and the key results. The F-15 was demonstrated to be an excellent flight research vehicle, producing high-quality results. Author

**WHAT USAF AIRCRAFT SHOULD BE THE WILD WEASEL OF THE 1990'S?: AN ASSESSMENT OF THE F-4G, THE F-15WW, AND F-16WW M.S. Thesis**
M. J. NEITZEL 7 Jun. 1985 125 p
(AD-A164727) Avail: NTIS HC A06/MF A01 CSCL 01C

The USAF Wild Weasel mission was born in 1965 during the Vietnam conflict. The purpose of the mission was to counter the

serious radar-directed threats that were decimating the US fighter arsenal. While the current F-4G Wild Weasel aircraft has effectively met the threat into the 1980's, its capabilities reflect the aircraft's 1950's design. Meanwhile, the Soviet Union is fielding many technologically advanced radar-directed threats that bring the adequacy of the F-4G into question. This study investigated what characteristics will be required to defeat the threat of the 1990's. Next, the F-4G, F-15WW, and F-16 Wild Weasel proposal were compared against the aircraft characteristics needed (as determined by a poll of experienced officers) to survive the threats in the 1990's. This thesis concludes that the F-15WW possesses the most desirable characteristics to serve as the Wild Weasel aircraft for the 1990's.

**THE C-17: AN ATTEMPT AT INCREASED AIRLIFT VERSATILITY M.S. Thesis**
J. W. STONE 7 Jun. 1985 127 p
(AD-A164822) Avail: NTIS HC A07/MF A01 CSCL 01C

The Airlift Master Plan was developed as a guide for achieving long-term military airlift objectives. The cornerstone of the plan is the development and acquisition of the C-17. Although the C-17's direct-delivery concept is new, the quest for expanded aircraft versatility has been continually pursued in previous airlift aircraft development programs. Thus the C-17 is not the first aircraft that has attempted to combine the traditionally separate roles of intertheater and intratheater airlift. The most recent attempt at developing an aircraft capable of meeting both strategic and tactical requirements resulted in the C-5A. The C-5A failed to achieve the operational versatility predicted by its proponents and that failure has given rise to serious questions in regard to the C-17's probability of success in realizing its expanded airlift goals. A comparison of the C-5A and C-17 programs revealed the differences in concept formulation, design and acquisition strategy which will allow the C-17 to achieve its operational goals. The study further concludes that the direct-delivery concept is a valid airlift objective and current technology permits the development of an aircraft with the performance capabilities necessary to fulfill that objective. **AN ANALYSIS OF S-3 SDLM (STANDARD DEPOT LEVEL MAINTENANCE) CORROSION DOCUMENTATION PROCEDURES M.S. Thesis**
S. L. HANSON and M. E. KARR Dec. 1985 77 p
(AD-A165588; NPS554-85-011) Avail: NTIS HC A05/MF A01 CSCL 05A

When senior personnel in Naval aviation are asked the question, How much time and money are we spending on corrosion prevention and correction?, fairly accurate estimates can be obtained for the organizational and intermediate levels of maintenance because they break out these costs in their maintenance data reporting systems. It is virtually impossible to quantify these same costs at the depot level since their current reporting system will not allow for the collection of such information. A second problem, caused by this rather limited reporting system, concerns the inability of the depot level engineering staff to gather sufficient accurate information about the types, extent, and locations of corrosion that occur on aircraft. This report provides a system design and implementation plan for corrosion monitoring for the Naval Air Rework Facility at Alameda, California. A computerized system for corrosion data collection and processing is needed. Research in this area led to the Depot Maintenance Data System (DMDS).

**PROCEEDINGS OF THE CONFERENCE ON LOW REYNOLDS NUMBER AIRFOIL AERODYNAMICS**
T. J. MUELLER, ed. Jun. 1985 356 p refs
(Contract NASA ORDER L-77177-B; N00014-85-G-0123)
(NASA-CR-177308; NAS 1.26:177308; AD-A163609; UNDAS-CP-77B123) Avail: NTIS HC A16/MF A01 CSCL 01B

Current interest in a variety of low Reynolds number applications has focused attention on the design and evaluation of efficient airfoil sections at chord Reynolds numbers from about 100,000 to about 1,000,000. These applications include remotely piloted vehicles (RPVs) at high altitudes, sailplanes, ultra-light man-carrying/man powered aircraft, mini-RPVs at low altitudes and wind turbines/propellers. Although the design and evaluation techniques for airfoil sections above chord Reynolds numbers of 500,000 are reasonably well developed problems related to boundary layer separation and transition have made it difficult to extend these techniques to lower Reynolds numbers. Presently available design and analysis techniques require improved criteria for laminar separation transition, reattachment and turbulent separation. Mathematical models of these complex phenomena require additional very careful experimental studies. GRA

**MICROWAVE LANDING SYSTEM (MLS) STATION INTERFACE CONTROL REPORT**
Jun. 1986 182 p
(Contract DTFA01-86-Y-01010)
(DOT/FAA/PM-86/17) Avail: NTIS HC A09/MF A01

This report contains requirements which are applicable to the MLS Interfaces for the system control functions, Remote Monitoring and Maintenance System status and maintenance reporting functions, and the synchronization function. The purpose is to provide for complete interoperability of MLS ground equipments which may have a different design and/or manufacturer, serving opposite ends of the same runway. Information is provided for the communication protocol and message/data formats between the Maintenance Processor Subsystem (MPS) and the Remote Monitoring System (RMS) of an MLS. The Remote Control and Status Unit (RCSU) is the RMS focal point for the MLS. Similar information is provided for the interface/communications between the RCSU and the stations of the MLS. A Printer/Terminal (P/T) provides active interface with the MLS stations. Information on the P/T interface and the set of P/T commands is provided. The various operating/non operating states of the MLS are given. A set of data parameters is given which may be transmitted to the MPS as descriptors of the MLS operating status history, site related parameters, monitor related parameters and maintenance related parameters. Parameter information is provided for the intra-system synchronization function.

**AIRCRAFT INFORMATION PACKET (GRAND CANYON NATIONAL PARK, ARIZONA)**
Sep. 1985 53 p
(PB86-159704; GCNP/AIR/INFO-85/1) Avail: NTIS HC A04/MF A01 CSCL 01B

The Aircraft Information Packet presents an overview of the aircraft overflight issue at Grand Canyon National Park which was made available for public review in September 1985. The packet consists of a task directive and pre-planning booklet distributed for public review and comment from September 17, 1985 through December 17, 1985. The task directive provides a background of the aircraft issue at Grand Canyon, the legal and policy constraints under which the management plan is being developed, a summary

of research to date, and a discussion of the planning process being followed. The pre-planning booklet provides an overview of current aircraft use, a summary of public involvement to date, and an analysis of possible mitigation actions being considered to address this issue.

## AERODYNAMICS

Includes aerodynamics of bodies, combinations, wings, rotors, and control surfaces; and internal flow in ducts and turbomachinery.

**A86-37192*** Ohio State Univ., Columbus.
**INVESTIGATIONS OF TRANSONIC TRAILING EDGE FLOWS**
S. L. PETRIE and D. S. EMMER (Ohio State University, Columbus, OH) IN: Aerospace simulation II; Proceedings of the Second Conference, San Diego, CA, January 23-25, 1986 . San Diego, CA, Society for Computer Simulation, 1986, p. 199-210. refs
(Contract NSG-2298)

An experimental study of several of the trailing edge and wake turbulence properties for a NACA 64A010 airfoil section was completed. The experiments were conducted at the Ohio State University Aeronautical and Astronautical Research Laboratory in the 6 inch x 22 inch transonic wind tunnel facility. The data were obtained at a free stream Mach number of 0.80 and a flow Reynolds number (based on chord length) of 5 million. The principal diagnostic tool was a dual-component laser Doppler velocimeter. The experimental data included surface static pressures, chordwise and vertical mean velocities, RMS turbulence intensities, local flow angles, and a determination of turbulence kinetic energy in the wake at chordwise locations between the transonic shock wave and the trailing edge, in the near wake just downstream of the trailing edge and in the far wake. At the two angles of attack tested (0 and 2 degrees), the turbulence intensities and turbulence kinetic energy were observed to decay in the streamwise direction. In the far wake, for the non-lifting case, the turbulence intensities were nearly isotropic. For the two degree case, the horizontal component of the turbulence intensity was observed to be substantially higher than the vertical component.

**AERODYNAMIC CHARACTERISTICS OF A CIRCULATION CONTROLLED SYMMETRICAL AIRFOIL WITH DUAL JET**
K. KUWABARA, K. TSUBOI, H. OKAMOTO, Y. TOMINAGA, and M. YASUHARA Japan Society for Aeronautical and Space Sciences, Journal (ISSN 0021-4663), vol. 34, no. 386, 1986, p. 125-133. In Japanese, with abstract in English. refs

The effects of two blowing jets on the aerodynamic characteristics of a 20 percent thick, noncambered airfoil are described. The free stream wind tunnel velocity is 10 m/s and the Reynolds number is 1.7 x 10 to the 5th. Section lift, drag and pitching moment coefficients are given at various effective angles of attack. The position of the second slot has a strong effect on the characteristics and the highest lift to drag ratio is given at 55 deg from the first one. A two-jet system is found to be more effective in producing high lift than a one-jet system at the same jet-power coefficient.

**CALCULATION OF HELICOPTER AIRFOIL CHARACTERISTICS FOR HIGH TIP-SPEED APPLICATIONS**
W. J. MCCROSKEY, J. D. BAEDER (U.S. Army, Aeroflightdynamics Directorate, Moffett Field, CA), and J. O. BRIDGEMAN (NASA, Ames Research Center, Moffett Field, CA) American Helicopter Society, Journal (ISSN 0002-8711), vol. 31, April 1986, p. 3-9. Previously announced in STAR as N86-18294. refs

In this paper, we have applied a new aerodynamic tool to the study of helicopter airfoil characteristics. We have shown that the computed airloads reproduce completely the experimental behavior of representative airfoils across the transonic regime. In addition, the computational details of the flow fields, the surface pressure distributions, and the viscous-layer characteristics enable us to trace the evolution of the physical changes that occur as m infinity or Re increases. Descriptions of the complicated development of shock waves, shock-induced separation supplement the information that has been obtained heretofore in wind tunnels. In validating our calculations and assessing the accuracy of the results, including extensive grid-refinement studies and comparisons with data from numerous wind tunnels, we have defined the capabilities and limitations of the code ARC2D more precisely. This important aspect of the investigations can complement wind-tunnel tests, by providing flow-field details that are difficult to measure and by extending the range of low parameters beyond the capabilities of existing wind tunnels. The code has now progressed from a purely research stage to almost a production stage, where it can be run by specialists in the helicopter industry.

**A86-37801**
**APPLIED AERODYNAMICS CONFERENCE, 4TH, SAN DIEGO, CA, JUNE 9-11, 1986, TECHNICAL PAPERS**
Conference sponsored by AIAA. New York, American Institute of Aeronautics and Astronautics, 1986, 446 p. For individual items see A86-37802 to A86-37850.

Papers are presented on unsteady transonic flows past airfoils using the Euler equations, an analysis of elliptic grid generation techniques using an implicit Euler solver, wing-wing interference effects for cruciform missiles, stability of side forces on bodies at high angles of attack, and wind tunnel test of a model rotor with a free tip. Consideration is given to viscous-inviscid analysis of transonic and low Reynolds number airfoils, effect of Karman vortex shedding on airfoil stall flutter, a two-dimensional transonic aerodynamic design method, unsteady forces on counter-rotating propeller blades, and flow structure of lateral wing-tip blowing. Additional papers include a high order supersonic triplet singularity, coupling between vehicle motion and slender cone transition, wing and conical body of arbitrary cross-section combinations in supersonic flow, influence of forebody cross-sectional shape on wing vortex burst location, and improved computation of the transonic flow on high-lift devices.

**UNSTEADY TRANSONIC FLOWS PAST AIRFOILS USING THE EULER EQUATIONS**
G. E. SMITH, H. A. HASSAN (North Carolina State University, Raleigh), and W. WHITLOW, JR. (NASA, Langley Research Center, Hampton, VA ) IN: Applied Aerodynamics Conference, 4th, San Diego, CA, June 9-11, 1986, Technical Papers . New York, American Institute of Aeronautics and Astronautics, 1986, p. 1-9. refs
(Contract NGT-34-002-800)
(AIAA PAPER 86-1764)

An explicit finite difference solver for the Euler equations was developed and used to calculate the flow past two of the AGARD standard aeroelastic configurations, an NACA 64A010 and an NLR 7301. The algorithm employed uses a modified four step Runge-Kutta time stepping scheme, boundary conditions determined from the time-dependent theory of characteristics and an unsteady automatic grid generation procedure. In general, the calculated results are in good agreement with available experiment. Moreover, they demonstrate the importance of using the Euler equations for super-critical airfoils and in situations where the transonic small disturbance theory results in poor agreement with experiment.

(AIAA PAPER 86-1766)

Several control function interpolation techniques in a general three-dimensional elliptic grid generation code and their effects on flow solutions using an implicit Euler algorithm are examined. These results will serve to guide the design of control function procedures and interpolation techniques in general grid generation codes. Three configurations and three grid types ('O', 'C', and 'H' grids) are examined. The results indicate that the selection of the control function interpolation techniques, which affects grid spacing, should be based on boundary curvature and spacing. The selection of the interpolation technique can then be made transparent to the user of general grid generation codes. Author

**EULER SOLUTIONS FOR AIRCRAFT CONFIGURATIONS EMPLOYING UPPER SURFACE BLOWING (USB)**

E. ATTA, S. RAGAB, and L. BIRCKELBAW (Lockheed-Georgia Co., Marietta) IN: Applied Aerodynamics Conference, 4th, San Diego, CA, June 9-11, 1986, Technical Papers . New York, American Institute of Aeronautics and Astronautics, 1986, p. 27-35. refs

(AIAA PAPER 86-1767)

A method has been developed for calculating the flowfield around complex aircraft configurations using upper-surface blowing (USB). The method is based on a zonal grid generation approach coupled with an Euler flow solver algorithm. In this method the flowfield is divided into a number of non-overlapped regions, each containing a component of the aircraft such as a wing, a fuselage or a nacelle. H-type grids are generated independently in each region using a hybrid elliptic/algebraic grid generation scheme. An explicit finite volume Euler algorithm has been developed that is applicable to the multi-region H-type grids. The present method has been applied to a two-dimensional USB model and a realistic aircraft configuration consisting of a wing/fuselage with two integrated nacelles. Numerical results indicate that the computational method is effective in predicting the flowfield about USB-type configurations and complex aircraft geometries. Author

**COMBINED, NONLINEAR AERODYNAMIC AND STRUCTURAL METHOD FOR THE AEROELASTIC DESIGN OF A THREE-DIMENSIONAL WING IN SUPERSONIC FLOW**

J. L. PITTMAN and G. L. GILES (NASA, Langley Research Center, Hampton, VA) IN: Applied Aerodynamics Conference, 4th, San Diego, CA, June 9-11, 1986, Technical Papers . New York, American Institute of Aeronautics and Astronautics, 1986, p. 35-44. refs

(AIAA PAPER 86-1769)

An iterative procedure for the static aeroelastic design of a flexible wing at supersonic speeds has been developed. The procedure combines a nonlinear, full-potential solver (NCOREL) with an equivalent plate structural analysis method. The NCOREL method yields significantly improved aerodynamic estimates compared to linear theory. The equivalent plate structural analysis method demonstrates an order of magnitude reduction in computer memory and execution time compared to finite-element methods. A highly swept wing is analyzed at high lift using this aeroelastic procedure. The results indicate that the wing deforms favorably due to aerodynamic loading and, consequently, that the inviscid drag levels do not vary at the required lift coefficient although the angle of attack varies significantly. A sensitivity analysis of the type required for optimization studies was also performed with the aeroelastic design procedure. Author

**VORTEX-INDUCED BENDING OSCILLATION OF A SWEPT WING**

L. E. ERICSSON (Lockheed Missiles and Space Co., Inc., Sunnyvale, CA) IN: Applied Aerodynamics Conference, 4th, San Diego, CA, June 9-11, 1986, Technical Papers . New York, American Institute of Aeronautics and Astronautics, 1986, p. 62-71. refs

(AIAA PAPER 86-1773)

An analysis of existing experimental results shows conclusively that the observed bending oscillations of a highly swept wing can not have been caused by the induced effects of a single leading edge vortex but are caused by the interaction between two leading edge vortices, one generated by a thick inner wing or wing-body glove and the other by the outboard, thin, variable sweep wing. This inner-outer wing vortex interaction is similar to that occurring on a double-delta planform wing. The cause of the negative aerodynamic damping from the vortex-interaction is the sensitivity to angle of attack and its time derivative of the spanwise location of a leading edge vortex. Author

**AN INVESTIGATION OF IMPROVING HIGH ANGLE OF ATTACK PERFORMANCE AND FLAP EFFECTIVENESS OF A CONFIGURATION WITH DELTA WING BY SPANWISE BLOWING**

L. SHEN and Y. QIN (China Aerodynamic Research and Development Centre, Mianyang, People's Republic of China) IN: Applied Aerodynamics Conference, 4th, San Diego, CA, June 9-11, 1986, Technical Papers . New York, American Institute of Aeronautics and Astronautics, 1986, p. 79-85. refs

(AIAA PAPER 86-1777)

The paper presents an investigation conducted in a 1.4 by 1.4-m wind tunnel and an 0.4 by 0.4-m water tunnel, respectively, to determine the improvement of high angle-of-attack performance and flap effectiveness of a 60-deg delta wing configuration by spanwise blowing at wing and trailing edge flaps, respectively. The data obtained in the wind tunnel shows that spanwise blowing at the wing results in much more vortex-induced lift with blowing at rearward chordwise locations than near the leading edge at high angles of attack. Spanwise blowing at trailing edge flap induces a significant improvement to the flap effectiveness over the entire angle-of-attack range tested. Water tunnel flow visualization shows that the nozzle chordwise location has significant effects on the vortex pattern over the wing at high angle-of-attack. It is concluded from flow visualization that the nozzle ought not to be placed near the core of vortex, and that if the nozzle is located in such a way that the jet cannot intersect the core of vortex, vortex-dominated flow can be maintained over a larger extent over the wing. **EULER SOLUTIONS FOR THE FLOW AROUND A HOVERING HELICOPTER ROTOR**
T. W. ROBERTS and E. M. MURMAN (MIT, Cambridge, MA) IN: Applied Aerodynamics Conference, 4th, San Diego, CA, June 9-11, 1986, Technical Papers . New York, American Institute of Aeronautics and Astronautics, 1986, p. 124-130. refs
(Contract NAG2-275)
(AIAA PAPER 86-1784)

A method for computing the flow around a hovering helicopter rotor is presented. The solution procedure is divided into two parts. The first part is a finite volume solution of the Euler equations for the near field flow around a rotor blade. The second part is a free wake approach for determining the wake geometry and induced velocities. These two parts are solved in a coupled fashion. The rolled-up vortex wake of the rotor is included in the Euler computational domain through a nonlinear perturbation technique. This eliminates the numerical diffusion of the wake vorticity due to truncation error and artificial viscosity without the need for excessive grid resolution near the vortex core. The method is used to compute both hovering rotor and wing/vortex interaction flows, and the results are compared to experiment. Author

**ANALYTICAL OBSERVATIONS ON THE AERODYNAMICS OF A DELTA WING WITH LEADING EDGE FLAPS**
S. OH and D. TAVELLA (Stanford University, CA) IN: Applied Aerodynamics Conference, 4th, San Diego, CA, June 9-11, 1986, Technical Papers . New York, American Institute of Aeronautics and Astronautics, 1986, p. 170-178. refs
(AIAA PAPER 86-1790)

The effect of a leading edge flap on the aerodynamics of a low aspect ratio delta wing was studied analytically using a simple vortex sheet model and compared with experiments. Particular attention was given to the influence of angle of attack and flap deflection angle on the lift and drag forces. Both lift and drag decrease with flap deflection, while the lift-to-drag ratio increases. A simple coordinate transformation was used to obtain a closed form expression for the lift-to-drag ratio as a function of flap deflection. Qualitative comparison with experiments is presented. **PROSPECTS FOR DESTRUCTIVE SELF-INDUCED INTERACTIONS IN A VORTEX PAIR DUE TO SINUSOIDAL DISTURBANCES**
V. J. ROSSOW (NASA, Ames Research Center, Moffett Field, CA) IN: Applied Aerodynamics Conference, 4th, San Diego, CA, June 9-11, 1986, Technical Papers . New York, American Institute of Aeronautics and Astronautics, 1986, p. 179-188. refs
(AIAA PAPER 86-1791)

The vortex wakes of large transport aircraft can pose a hazard to smaller following aircraft in the vicinity of airports during landing and take-off operations if certain separation guidelines are not observed. In order to reduce the hazard potential, and thereby the separation distances, efforts are being made to find more rapid wake-dissipation mechanisms. In this paper numerical simulations are made of the three-dimensional time-dependent instabilities that might be initiated in a vortex pair by sinusoidal displacements of the filaments. The objective of the study was to find those displacements and phase angles that would produce the most rapid destruction of the vortices. It is concluded that, of the wave patterns tried on the one pair of wake filaments, the only instability mode that leads to destructive interactions of the vortices is the Scorer-Crow process. **A TWO-DIMENSIONAL TRANSONIC AERODYNAMIC DESIGN METHOD**
M. GILES and M. DRELA (MIT, Cambridge, MA) IN: Applied Aerodynamics Conference, 4th, San Diego, CA, June 9-11, 1986, Technical Papers . New York, American Institute of Aeronautics and Astronautics, 1986, p. 197-204. refs
(Contract F49620-78-C-0084)
(AIAA PAPER 86-1793)

This paper demonstrates the capabilities of a new transonic, two-dimensional design method. The method is based upon the simultaneous solution of multiple streamtubes, coupled through the position of, and pressure at, the streamline interfaces. This allows the specification of either the airfoil shape (direct, analysis mode) or the airfoil surface pressure distribution (inverse, design mode). The nonlinear system of equations is formulated in a conservative manner which guarantees the correct treatment of shocks, and is solved by a rapid Newton solution method. Viscous effects can also be included through a coupled integral boundary layer analysis. The first set of results shows the effect of different far-field treatments, demonstrating the improvement in accuracy obtained by including the second-order doublet terms in addition to the usual first-order vortex term. They also compare the results to ones obtained by specifying straight far-field streamlines (corresponding to solid wall wind tunnel experiments) or constant far-field pressure (corresponding to free jet experiments) to show the sensitivity to the far-field distance. In the second set of results the method is used to design a transonic airfoil with $C(l) = 1.000$ at freestream Mach number = 0.70. It is shown that the off-design performance is improved by specifying a surface pressure distribution with a very weak shock. Viscous effects are also assessed. Author

**A SPECTRAL HODOGRAPH METHOD FOR SHOCKLESS TRANSONIC TWO-DIMENSIONAL FLOW**
C. MAVRIPLIS (MIT, Cambridge, MA) and W. L. HARRIS (Connecticut, University, Storrs) IN: Applied Aerodynamics Conference, 4th, San Diego, CA, June 9-11, 1986, Technical Papers . New York, American Institute of Aeronautics and Astronautics, 1986, p. 205-213. NSERC-supported research. refs
(Contract N00014-82-K-0311)
(AIAA PAPER 86-1796)

An iterative numerical method involving a Chebyshev-Fourier pseudo-spectral method is constructed for the solution of two-dimensional shockless transonic potential flow in the hodograph plane. The problem is posed in the hodograph plane where the governing equation is a linear variable coefficient mixed (hyperbolic-elliptic) partial differential equation where complications due to singularities and boundary conditions arise. A numerical/analytical method is devised to solve the equation efficiently and accurately for the streamfunction. Interpolated pseudo-spectral solutions for a zero streamfunction are integrated analytically back to the physical plane to yield body coordinates. The method is tested on the design of a NACA 0012 airfoil as well as a NLR quasi-elliptical airfoil starting from a circular cylinder. In its present form the method is efficient but limited to simple bodies in transonic flow as well as sensitive to certain input parameters. Further work on this method is to extend it to yield a very efficient inverse design method for shockless airfoils in transonic flow. Author

**PLANFORM EFFECTS FOR LOW-FINENESS RATIO MULTIBODY CONFIGURATIONS AT SUPERSONIC SPEEDS**

S. N. MCMILLIN and R. M. WOOD (NASA, Langley Research Center, Hampton, VA) IN: Applied Aerodynamics Conference, 4th, San Diego, CA, June 9-11, 1986, Technical Papers . New York, American Institute of Aeronautics and Astronautics, 1986, p. 214-220. refs

(AIAA PAPER 86-1799)

An experimental and theoretical investigation of planform effects on a low-fineness ratio multibody configuration has been conducted in NASA Langley Research Center's Unitary Plan Wind Tunnel at Mach numbers 1.6, 1.8, 2.0, and 2.16. Experimental and theoretical values of lift, drag, and pitching moment were obtained on three configurations which varied in outboard panel planform only. The three variations were at 65 deg delta, a 70/66 deg cranked arrow, and a 20 deg trapezoidal planform . The purpose of the study was to determine the effect of wing planform on the supersonic aerodynamics and to evaluate the ability of two existing linearized-theory aerodynamic methods to predict these effects. Experimental data showed that the planforms produced the lift, drag-due-to-lift, and pitching-moment characteristics typically found on single-body configurations. However, the data also showed that planform has a minimal influence on zero-lift drag, which is not typical of single-body configurations. Theoretical aerodynamic analysis indicated that codes based on linearized theory adequately predicted the effect of planform on the supersonic aerodynamics. Author

**AERODYNAMIC EFFECTS OF WINGTIP-MOUNTED PROPELLERS AND TURBINES**

L. R. MIRANDA and J. E. BRENNAN (Lockheed-California Co., Burbank) IN: Applied Aerodynamics Conference, 4th, San Diego, CA, June 9-11, 1986, Technical Papers . New York, American Institute of Aeronautics and Astronautics, 1986, p. 221-228. refs

(AIAA PAPER 86-1802)

A simple analytical model of the interaction between a wing and propellers or turbines is formulated and discussed in this paper. This model is particularly suited to study wingtip-mounted propellers or turbines. The computer program based on the present method, known as PROPWING, also allows the determination of the optimum spanload distribution for a wing in the presence of propellers. Correlation with available experimental data proves the validity of the subject methodology for preliminary design application. Numerical studies conducted with PROPWING indicate that substantial performance benefits can be achieved by properly mounting the propellers at the wingtips. These results appear to confirm a similar conclusion derived by NASA-Langley researchers from wind tunnel investigations of wingtip-mounted propellers and turbines. Author

**COUNTERFLOW SONIC NOSEJET INTO A SUPERSONIC STREAM**

J. H. FOX (Calspan Corp., Arnold Air Force Station, IN) IN: Applied Aerodynamics Conference, 4th, San Diego, CA, June 9-11, 1986, Technical Papers . New York, American Institute of Aeronautics and Astronautics, 1986, p. 250-255. refs

(AIAA PAPER 86-1808)

The flow field resulting from a sonic nosejet issuing counter to a supersonic stream is computed using an implicit, thin-layer Navier-Stokes solver with bow-shock fitting. A hemisphere-cylinder submerged in a Mach 2.5 stream is analyzed. The nosejet has a nozzle diameter equal to 0.13 cylinder diameters. This configuration has a very large recirculating flow region adjacent to the jet. Comparisons of the computed pressure distribution on the nose with measured data are presented and show good agreement. The attachment location of the separated stream on the hemisphere nose is also well predicted. Various features of the flow are discussed. To demonstrate the method further, an additional computation is presented of a sonic jet issuing from an ogive nose into a Mach 6 stream. The features of the computed flow field again compare very well with experiment. Author

**FLOW STRUCTURE OF LATERAL WING-TIP BLOWING**

C. S. LEE, D. TAVELLA, N. J. WOOD, and L. ROBERTS (Stanford University, CA) IN: Applied Aerodynamics Conference, 4th, San Diego, CA, June 9-11, 1986, Technical Papers . New York, American Institute of Aeronautics and Astronautics, 1986, p. 256-264. refs

(AIAA PAPER 86-1810)

Flow field surveys of the near wake behind a rectangular wing with lateral blowing were made by using a five-hole probe in a low speed wind tunnel. The effect of the jet configuration on the wake structure was investigated by offsetting the jet vertically from the chord line and deflecting the jet relative to the span. The enhancement of lift by the jet blowing was found to be an inviscid characteristic. The favorable lift increments of the slanted down and offset up blowing were mainly due to larger displacement of the tip vortices resulting from a complex three dimensional interaction of the asymmetric jet in a cross flow. Secondary vortices rotating in the opposite direction to the primary vortices were observed for the cases with favorable lift augmentation. The presence of secondary vortices has a significant influence on the position of the primary vortices, which affects the lift increment along the whole span. The tip vortices are considerably diffused by weak lateral blowing. Author

**THE USE OF CURVED HIGHER ORDER PANELS FOR VORTEX SHEET MODELING**

M. G. NAGATI (Wichita State University, KS), J. D. IVERSEN, and J. M. VOGEL (Iowa State University of Science and Technology, Ames) IN: Applied Aerodynamics Conference, 4th, San Diego, CA, June 9-11, 1986, Technical Papers . New York, American Institute of Aeronautics and Astronautics, 1986, p. 272-280. Research supported by Wichita State University and NASA. refs

(AIAA PAPER 86-1812)

A method is presented for predicting the geometry of a vortex sheet trailing a lift generating wing in its vicinity. It differs from others in that it uses a continuous vorticity distribution rather than discrete vortex filaments. It was found that the results were in good agreement with available experimental data, after the initial cycle of what was to be a relaxation scheme, so that iterations for this end were unnecessary. While the technique is computing intensive, it becomes attractive when used in conjunction with panel methods applications for complete aircraft configurations. The panel method solution needs to be found only once for each streamwise station downstream of the wing. Corrections applied are geometric in nature and are independent of other computational aspects. Author

**A86-37834#**

### A HIGH ORDER SUPERSONIC TRIPLET SINGULARITY

F. A. WOODWARD IN: Applied Aerodynamics Conference, 4th, San Diego, CA, June 9-11, 1986, Technical Papers . New York, American Institute of Aeronautics and Astronautics, 1986, p. 281-287. refs
(AIAA PAPER 86-1815)

Constant and linear distributions of triplet singularities are derived, and compared with the high order source and doublet singularities used in PANAIR. The new singularities are designed to provide piecewise linear continuity of singularity strength across all panel edges, and utilize a sub-paneling technique if necessary to enforce geometrical continuity. The singularities are built up by combining the influences of these basic distributions over 6 or 9 panel groups surrounding the control point, and effectively minimize the number of equations required to satisfy the boundary conditions of tangential flow on the external surface of the body. Author

### SUPERSONIC AIRFOIL OPTIMIZATION

J. L. PITTMAN (NASA, Langley Research Center, Hampton, VA) IN: Applied Aerodynamics Conference, 4th, San Diego, CA, June 9-11, 1986, Technical Papers . New York, American Institute of Aeronautics and Astronautics, 1986, p. 302-309, 45. refs
(AIAA PAPER 86-1818)

A procedure for the optimization of supersonic airfoils is presented. A nonlinear, full-potential solver (NCOREL) is coupled with a numerical optimizer (CONMIN). The NCOREL code is a three-dimensional supersonic marching method, however, only two-dimensional (conical) results are used for the airfoil problem. Each airfoil evaluated in the NCOREL aerodynamic code is composed of a linear combination of user-specified basis airfoils. The weighting factors of the basis airfoils plus the angle of attack form the design variable vector. The inviscid drag coefficient is minimized subject to lift and crossflow Mach number gradient constraints. The optimization strategy is found to be extremely important for the efficient determination of an optimum airfoil. Author

**A86-37838#**

### THREE-DIMENSIONAL INTERACTION OF WAKES AND BOUNDARY LAYERS

L. C. SQUIRE (Cambridge University, England) and A. H. KH. MOGHADAM IN: Applied Aerodynamics Conference, 4th, San Diego, CA, June 9-11, 1986, Technical Papers . New York, American Institute of Aeronautics and Astronautics, 1986, p. 310-319. refs
(AIAA PAPER 86-1820)

This work concerns a fundamental study of the three-dimensional aspects of the wake/boundary layer interaction as it occurs on high-lift wings, particularly the slat-wake/wing boundary layer interaction. A digital system for measuring and recording all the components of the mean velocity and the Reynolds stress tensor using a triple hot-wire probe has been developed. This system has been tested and has been used to measure the interaction between the wakes of swept aerofoils and the fully turbulent boundary layer developing on a flat plate. An important result is that the three-dimensional aspects of this flow decay quickly downstream of the aerofoil. Two cases of three-dimensional interaction have been simulated. In one case the interaction is fully three-dimensional, while in the other case the interaction can be assumed to be quasi-three-dimensional. For the quasi-three-dimensional confluent flow, the measured results have been compared with the predictions of the two-dimensional form of K-epsilon and algebraic stress turbulence models. The overall agreement between the measured and predicted results is good. However, for the turbulence flow field the agreement is less satisfactory in the initial mixing region where the three-dimensionality is strong, and it is also poor in the wall boundary layer. Author

### DRAG-REDUCTION CHARACTERISTICS OF AFT-SWEPT WING TIPS

C. P. VAN DAM (California, University, Davis) IN: Applied Aerodynamics Conference, 4th, San Diego, CA, June 9-11, 1986, Technical Papers . New York, American Institute of Aeronautics and Astronautics, 1986, p. 327-338. refs
(Contract NAS1-17797)
(AIAA PAPER 86-1824)

Results are presented of a study conducted to analyze the potential aerodynamic improvements which can be obtained with aft-swept wing tips at subsonic speeds. A review and summary of previous swept-tip applications and studies are given. Additionally, the through evolution optimized tail-fin shapes of fast-cruising aquatic animals are examined as well as the wing planform shapes of sea birds. These superior long-distance travellers both display lifting-surface planform shapes with increased leading-edge sweep towards the tip. These observations and analytical results obtained with a nonlinear surface-panel method demonstrate that substantial induced-drag improvements can be obtained through the adoption of planform shapes with highly-tapered aft-swept tips. Author

### WING AND CONICAL BODY OF ARBITRARY CROSS-SECTION COMBINATIONS IN SUPERSONIC FLOW

D. MATEESCU (McGill University, Montreal, Canada) IN: Applied Aerodynamics Conference, 4th, San Diego, CA, June 9-11, 1986, Technical Papers . New York, American Institute of Aeronautics and Astronautics, 1986, p. 339-347. refs
(AIAA PAPER 86-1826)

This paper presents an analysis of wing and conical body of arbitrary cross-section combinations in supersonic flow. Particular emphasis is given to the delta wing and elliptic cone combinations, for which analytical solutions are obtained for the spanwise variation of the lifting load coefficient; both cases of subsonic and supersonic leading edges are equally treated. In this formulation the wind incidence is allowed to change along the span, as in the case of wingbody systems with leading edge flaps, or with a continuously variable wing incidence. The theoreticcal solutions obtained for the delta wing and elliptic cone systems are in good agreement with Jorgensen's experimental results for various Mach numbers, wing spans and cross-sectional semi-axis ratios. Good agreement with the experimental results is also observed in the limit case of isolated elliptic cones. Author

### THE EXTERNAL DRAG OF A SIMPLE AXISYMMETRIC BODY OF REVOLUTION IN SUBSONIC AND SUPERSONIC FLOW WITH VARIABLE MASS FLOWTHROUGH RATIOS

T. OSAWA (UBE Industries, Ltd., Tokyo, Japan) and H. HEWITT (Tennessee Technological University, Cookeville) IN: Applied Aerodynamics Conference, 4th, San Diego, CA, June 9-11, 1986, Technical Papers . New York, American Institute of Aeronautics and Astronautics, 1986, p. 348-354. refs
(AIAA PAPER 86-1828)

The external wave drag of a simple axisymmetric body of revolution was obtained by numerically solving the time-dependent Euler equations. The numerical algorithm used was MacCormack's explicit scheme for Mach numbers from 0.8 to 4.0. The four cases studied included a closed body, and open body with and without sting supports, and an open body with flow spillage at the intake of the flow-through duct. In order to simulate the flow spillage, a boundary was set at the inlet of the duct. The boundary condition was obtained by the one-dimensional normal shock assumption which was developed by Wyatt to given an additive drag. As a result, the present method gave good agreement with a perturbation solution for the closed body. For the open body without flow spillage, the wave drag coefficients were found to be larger than for the closed body. The boundary condition at the inlet of the flow-through duct successfully simulated the flowfield near the intake for the case of the open body with spillage. This case was also compared with experimental data, assuming the friction drag was constant, and gave good agreement. Author

**A86-37846*#** Kansas Univ., Lawrence.

**CALCULATION OF ASYMMETRIC VORTEX SEPARATION ON SLENDER DELTA WINGS WITH A VORTEX-SHEET MODEL**

C. E. LAN (Kansas, University, Lawrence) IN: Applied Aerodynamics Conference, 4th, San Diego, CA, June 9-11, 1986, Technical Papers . New York, American Institute of Aeronautics and Astronautics, 1986, p. 391-400. refs
(Contract NSG-1629)
(AIAA PAPER 86-1836)

An inviscid vortex-sheet model based on the slender wing theory is developed to examine asymmetric vortex separation at zero sideslip on delta wings. It is found that multiple asymmetric vortex configurations exist at a given angle of attack. Available data on rolling moment measurements and flow visualization are used for correlation to prove the concept. Author

**AN IMPLICIT FLUX-DIFFERENCE SPLITTING SCHEME FOR THREE-DIMENSIONAL, INCOMPRESSIBLE NAVIER-STOKES SOLUTIONS TO LEADING EDGE VORTEX FLOWS**

P.-M. HARTWICH (NASA, Langley Research Center, Hampton, VA) and C.-H. HSU (Kansas, University, Lawrence) IN: Applied Aerodynamics Conference, 4th, San Diego, CA, June 9-11, 1986, Technical Papers . New York, American Institute of Aeronautics and Astronautics, 1986, p. 401-410. refs
(Contract NAG1-455)
(AIAA PAPER 86-1839)

A new, implicit finite-difference scheme designed to solve the conservative, flux-difference split Navier-Stokes equations is used to compute incompressible vortex flows around delta wings. The completely vectorizable hybrid algorithm is constructed in delta form for steady state solutions independent of the time-step sizes. The scheme combines approximate factorization in crossflow planes with a symmetric planar Gauss-Seidel relaxation in the remaining spatial direction. The governing equations are solved in curvilinear, body-fitted coordinates for treating complex geometries. The computed flow field results are compared with other theoretical and experimental data. Author

**A COMPARISON OF EXPERIMENTAL AND NUMERICAL RESULTS FOR DELTA WINGS WITH VORTEX FLAPS**

K. G. POWELL, E. M. MURMAN (MIT, Cambridge, MA), R. M. WOOD, and D. S. MILLER (NASA, Langley Research Center, Hampton, VA) IN: Applied Aerodynamics Conference, 4th, San Diego, CA, June 9-11, 1986, Technical Papers . New York, American Institute of Aeronautics and Astronautics, 1986, p. 411-424. refs
(Contract NAG1-358)
(AIAA PAPER 86-1840)

Computational and experimental results are presented for delta wings with vortex flaps. The wings have an undeflected leading-edge sweep of 75 deg. Flap angles of 5 deg and 10 deg, measured in the streamwise direction, are considered. The nominal angle of attack alpha is varied from 4 deg to 12 deg. Results for freestream Mach numbers of 1.7 and 2.4 are shown. Surface pressure, tuft patterns and vapor screens are given for the experimental data. Surface pressure, tuft patterns, cross-flow velocities, total pressure loss and cross-flow Mach number are given for the numerical data. C(l)-vs-alpha curves are shown for experimental and computational results. The flows are shown to be very sensitive to angle of attack, and the agreement between experimental and theoretical results is improved if the calculations are made at angles of attack slightly larger than the experimental angles of attack. The computational model correctly predicts the topology of the flow in each of the cases considered. The lift is predicted well at the higher angles of attack, but slightly overpredicted at the lower angles of attack. Author

**SPREADING OF TWO-STREAM SUPERSONIC TURBULENT MIXING LAYERS**

N. CHINZEI, G. MASUYA, T. KOMURO, A. MURAKAMI, and K. KUDOU (National Aerospace Laboratory, Kakuda, Japan) Physics of Fluids (ISSN 0031-9171), vol. 29, May 1986, p. 1345-1347. refs

Two-stream supersonic turbulent mixing layers with a free-stream Mach number of 2.3 on the high-velocity side are experimentally investigated. A large-scale vortical structure, which has been believed to dominate the development of incompressible mixing layers, is also observed in the present supersonic layers. The spreading rate of the layer is correlated with a velocity ratio of the free streams and a Mach number based on the velocity difference across the layer. Author

**APPLICATION OF OPTICAL INTERFEROMETRY IN COMPRESSIBLE FLOWS**

W. D. BACHALO (Aerometrics, Inc., Mountain View, CA) IN: ICIASF '85 - International Congress on Instrumentation in Aerospace Simulation Facilities, 11th, Stanford, CA, August 26-28, 1985, Record . New York, Institute of Electrical and Electronics Engineers, 1985, p. 277-287. NASA-supported research. refs

Interferometry methods were applied to the investigation of steady and unsteady flows in large scale transonic wind tunnels. Holographic interferometry was demonstrated to provide reliable flow visualization and quantitative results for a number of two-dimensional flows. These conclusions were based on extensive comparisons with results obtained by other means. Data obtained on a NACA 64A010 airfoil with an oscillating flap installed in the Ames 11-foot transonic tunnel are presented. Interferograms were recorded at a free stream Mach number of 0.8, flap frequency of 30 Hertz and chord Reynolds numbers of 6.6 x 10 to the 6th and 12.3 x 10 to the 6th. The interferometric results were reduced to dynamic surface pressures, Mach contours and wake flow profiles. A new interferometry method that is capable of providing real-time interferometry data is also discussed. Author

**SWEPT WING-TIP SHAPES FOR LOW-SPEED AIRPLANES**

C. P. VAN DAM (Vigyan Research Asociates, Inc., Hampton, VA) SAE, Aerospace Technology Conference and Exposition, Long Beach, CA, Oct. 14-17, 1985. 12 p. refs
(Contract NAS1-17797)
(SAE PAPER 851770)

Preliminary results are presented of a study conducted to analyze the effects of several plan-form modifications on the aerodynamic characteristics of a high-aspect-ratio, natural laminar flow (NLW) wing. The study addresses the potential aerodynamic improvements available at both cruise and high angles of attack by use os swept wing-tip shapes. The swept wing tip appears to offer a viable addition to the lift of wing-tip designs which provide improvements in aerodynamic efficiency, with the added safety benefit of providing high angle-of-attack departure resistance. **THE X-29 - A UNIQUE AND INNOVATIVE AERODYNAMIC CONCEPT**

D. FREI and M. MOORE (Grumman Corp., Bethpage, NY) SAE, Aerospace Technology Conference and Exposition, Long Beach, CA. Oct. 14-17, 1985. 12 p. DARPA-supported research. refs
(SAE PAPER 851771)

The X-29 was conceived to demonstrate in-flight the potential advantages of several advanced and innovative technologies integrated into one vehicle design. These advanced technologies include: (1) a forward-swept wing employing a thin supercritical airfoil; (2) aeroelastically-tailored composite wing covers to control divergence; (3) a close-coupled, variable-incidence canard; (4) variable wing camber; and (5) three-surface trim configuration. An aerodynamic overview of the configuration development and integration of these technologies is presented. Wind tunnel results

and flight test results, where available, are also presented to substantiate the advantages of these innovative concepts.

### COMPUTATIONAL AERODYNAMIC DESIGN - X-29, THE GULFSTREAM SERIES AND A TACTICAL FIGHTER

C. W. BOPPE (Grumman Corp., Bethpage, NY) SAE, Aerospace Technology Conference and Exposition, Long Beach, CA, Oct. 14-17, 1985. 47 p. refs
(SAE PAPER 851789)

Elements of computational aerodynamic design are described by tracing the development of three different aircraft configuration types. The Gulfstream series (G-II, G-III, and G-IV) illustrates from 1966 to the present the evolution of both computational tools and design philosophy. This transport experience is augmented by two distinct fighter designs that feature transonic maneuver requirements: the X-29 Forward Swept Wing Demonstrator Aircraft and a generic tactical fighter configuration. These state-of-the-art applications show how courses are charted to circumvent limitations in computerized flow simulation techniques. Problems associated with drag prediction, complex geometry modeling, nonpotential phenomena, and code convergence for extreme conditions/shapes are addressed. Primary topics in wing design are complemented with auxiliary studies performed on canards, tails, nacelles, and winglets to provide perspective for the total aircraft development process. Good and bad experiences are included. Computational Fluid Dynamics (CFD) impact is evaluated by means of performance levels achieved (wind tunnel and flight test data), resources saved, and insight provided for unscrambling complex aircraft synthesis problems. Future CFD requirements are discussed. Author

### REDUCED NAVIER-STOKES (RNS RELAXATION PROCEDURE FOR INTERNAL FLOWS WITH INTERACTION)

D. R. REDDY, R. A. DELANEY (General Motors Corp., Allison Gas Turbine Div., Indianapolis, IN), and S. G. RUBIN (Cincinnati, University, OH) SAE, Aerospace Technology Conference and Exposition, Long Beach, CA, Oct. 14-17, 1985. 12 p. refs
(SAE PAPER 851790)

A multisweep relaxation procedure is considered in the following study for two-dimensional and three-dimensional internal flows with interaction using reduced (pressure-elliptic) Navier-Stokes (RNS) equations. The velocities and pressures are fully coupled in the algorithm, and the pressure gradient in the streamwise momentum equation is appropriately treated to simulate the elliptic interaction. A Poisson type of equation is not required. The continuity equation is directly satisfied everywhere in the flow domain. Incompressible flow solutions are obtained for a two-dimensional channel with a backward facing step and a three-dimensional duct with square cross section. The solution for these test cases demonstrates the capability of the RNS algorithm to solve internal flows with strong interaction encountered in turbomachinery passages. Author

### OPTIMIZATION OF A SUPERSONIC WING BY COMBINING LINEAR AND EULER METHODS

J. M. ROSS, J. S. REASER, and E. E. BOUCHARD (Lockheed-California Co., Burbank) SAE, Aerospace Technology Conference and Exposition, Long Beach, CA, Oct. 14-17, 1985. 9 p. refs
(SAE PAPER 851791)

A combination of linear and nonlinear methods was found to be effective in designing a supersonic fighter wing. The design Mach number was 1.6, with cruise and maneuver lift coefficients of 0.1 and 0.4. The planform was a tapered arrow wing with a subsonic leading edge. It was chosen based on general aerodynamic principles tempered with practical considerations. Initial camber and twist distributions were determined from a linear method. An Euler code was then used to improve upon the linear design; chordwise loading was made more uniform, and spanwise loading was adjusted toward the ideal elliptic distribution. The nonlinear calculations suggest the best approach is to use the linear method optimization at half the desired lift coefficient, and then to modify the design based on nonlinear analysis. Author

### ENGINEERING APPLICATIONS OF AN ADVANCED LOW-ORDER PANEL METHOD

C. E. JOHNSTON, H. H. YOUNGREN, and J. S. SIKORA (Lockheed-California Co., Burbank) SAE, Aerospace Technology Conference and Exposition, Long Beach, CA, Oct. 14-17, 1985. 10 p. refs
(SAE PAPER 851793)

Panel methods have become important aerodynamic prediction tools for aircraft design and analysis. To demonstrate the utility and accuracy of panel methods, three applications illustrating their usage are discussed in this paper. The computer code used is Lockheed's advanced low-order QUADrilateral element PANel method (QUADPAN). The first case presents correlation of force and moment predictions on a Lockheed P-3 Orion aircraft with rotodome for airborne early warning and control (AEW and C). The ability to predict incremental effects due to the rotodome is demonstrated. The second application investigates the local flow behavior in the vicinity of the engine pylon and nacelle for a re-engined Boeing 727 derivative aircraft. Results include surface pressure distributions and the local flow characteristics using the flow-survey capability of QUADPAN. Finally, the third compares stability and rate derivative calculations for the Rockwell Space Shuttle atmospheric re-entry vehicle to wind tunnel and flight test data. Author

### APPLICATION OF THE VORTEX-LATTICE METHOD TO HIGH-ANGLE-OF-ATTACK SUBSONIC AERODYNAMICS

D. T. MOOK and A. H. NAYFEH (Virginia Polytechnic Institute and State University, Blacksburg,) SAE, Aerospace Technology Conference and Exposition, Long Beach, CA, Oct. 14-17, 1985. 18 p. refs
(Contract N00014-85-K-0011; AF-AFOSR-85-0158; NR PROJECT 061-201)
(SAE PAPER 851817)

The vortex-lattice method for general, unsteady, incompressible aerodynamics is described. This method can treat multiple lifting surfaces operating in close proximity, fully accounting for interference. It is not limited by planform, camber, twist, or maneuver as long as separation occurs only along known lines and vortex bursting does not occur near one of the lifting surfaces. Steady flows can be treated efficiently as special cases of uniform motion. Several examples are presented as a partial illustration of the range of problems that can be treated. These include steady and unsteady flows over rectangular and delta wings, a numerical simulation of the wing rock phenomenon, and steady and unsteady interference among two canards and a wing. In the numerical simulation of wing rock, the equation governing the motion of a delta wing mounted on a free-to-roll sting is integrated numerically by a predictor-corrector method with the aerodynamic roll moment being supplied by the vortex-lattice method. This numerical solution determines the motion of the wing and the flow-field simultaneously, fully accounting for the aerodynamic/dynamic interaction. The numerical solutions are in good agreement with available experimental data. Author

### A THREE-DIMENSIONAL BOUNDARY-LAYER METHOD FOR FLOW OVER DELTA WINGS WITH LEADING-EDGE SEPARATION

S. H. WOODSON and F. R. DEJARNETTE (North Carolina State University, Raleigh) SAE, Aerospace Technology Conference and Exposition, Long Beach, CA, Oct. 14-17, 1985. 13 p. refs
(Contract NCC1-22; NCC1-46)
(SAE PAPER 851818)

A three-dimensional, laminar boundary-layer method is applied to the incompressible flow over a slender delta wing at incidence. The predictor-corrector finite-difference scheme of Matsuno is used to difference the governing equations. The method has the advantages that no iterations are required to advance the solution and the cross-flow derivatives are formed independent of the cross-field direction. The difference scheme is demonstrated to yield accurate numerical results when compared to the exact solution of the three-dimensional boundary-layer equations for parabolic flow over a moving flat plate. The method is applied to delta wings of various sweep angles at angles of attack up to 20 deg., with the inviscid solution determined using a higher-order, three-dimensional panel method. Author

**INVISCID AND VISCOUS SIMULATIONS OF HIGH ANGLE OF ATTACK FLOWS**

D. K. OTA, S. R. CHAKRAVARTHY, and J. J. GORSKI (Rockwell International Science Center, Thousand Oaks, CA) SAE, Aerospace Technology Conference and Exposition, Long Beach, CA, Oct. 14-17, 1985. 15 p. refs
(SAE PAPER 851820)

High angle of attack flow for a NACA0012 airfoil has been computed using an Euler code and a Navier-Stokes code. These codes are based on an implicit finite-volume Total-Variation-Diminishing (TVD) formulation of the convection terms. Comparison of the two solutions shows that the Euler code does not result in a realistic separated flow solution while the Navier-Stokes code does. Author

**A FASTER 'TRANSITION' TO LAMINAR FLOW**

P. J. BOBBLTT, E. G. WAGGONER, W. D. HARVEY, and J. R. DAGENHART (NASA, Langley Research Center, Hampton, VA) SAE, Aerospace Technology Conference and Exposition, Long Beach, CA, Oct. 14-17, 1985. 28 p. refs
(SAE PAPER 851855)

A discussion is given of the ongoing research related to laminar flow airfoils, nacelles, and wings where the laminar flow is maintained by a favorable pressure gradient, surface suction or a combination of the two. Design methologies for natural laminar flow airfoil sections and wings for both low and high speed applications are outlined. Tests of a 7-foot chord, 23-deg sweep laminar flow-control airfoil at high subsonic Mach numbers are described, along with the associated stability theory used to design the suction system. The state-of-the-art of stability theory is simply stated and a typical calculation illustrated. In addition, recent computer simulations of transition using the time dependent Navier-Stokes equations are briefly described. Advances in wind tunnel capabilities and instrumentation will be reviewed, followed by the presentation of a few results from both wind tunnels and flight. Finally, some suggestions for future work will complete the paper. Author

**EXPERIMENTS ON SUPERSONIC TURBULENT FLOW DEVELOPMENT IN A SQUARE DUCT**

F. B. GESSNER (Washington, University, Seattle), S. D. FERGUSON (Boeing Aerospace Co., Seattle, WA), and C. H. LO (Spectra Technology, Inc., Flow Technology Div., Bellevue, WA) AIAA and ASME, Fluid Mechanics, Plasma Dynamics and Lasers Conference, 4th, Atlanta, GA, May 12-14, 1986. 10 p. refs
(Contract NGR-48-002-141)
(AIAA PAPER 86-1038)

The nature of supersonic, turbulent, adiabatic-wall flow in a square duct is investigated experimentally over a development length of x/D between 0 and 20 for a uniform flow, Mach 3.9 condition at the duct inlet. Initial discussion centers on the duct configuration itself, which was designed specifically to minimize wave effects and nozzle-induced distortion in the flow. Total pressure contours and local skin friction coefficient distributions are presented which show that the flow develops in a manner similar to that observed for the incompressible case. In particular, undulations exist in total pressure contours within the cross plane and in transverse skin friction coefficient distributions, which are indicative of the presence of a well-defined secondary flow superimposed upon the primary flow. The results are analyzed to show that local law-of-the-wall behavior extends well into the corner region, which implies that wall functions conventionally applied in two-equation type turbulence models, when suitably defined for compressible flow, may also be applied to supersonic streamwise corner flows. **NAVIER-STOKES COMPUTATIONS OF LEE-SIDE FLOWS OVER DELTA WINGS**

J. L. THOMAS and R. W. NEWSOME (NASA, Langley Research Center, Hampton, VA) AIAA and ASME, Fluid Mechanics, Plasma Dynamics and Lasers Conference, 4th, Atlanta, GA, May 12-14, 1986. 16 p. refs
(AIAA PAPER 86-1049)

Solutions to the Navier-Stokes equations for the flow over delta wings are computed with emphasis on the separated vortical flows developing on the lee side at high angles of attack. A recently developed implicit algorithm is used which employs upwind differencing for the pressure and convection terms and central differencing for the shear stress and heat transfer terms. Solutions to both the three-dimensional equations and the approximate conical flow equations are compared parametrically with an extensive experimental data base at supersonic speeds. The computations indicate that the conical flow approximation provides results in close agreement with the three-dimensional equations, even to angles of attack as high as 20 degrees. Good agreement with experimentally measured pressures and vapor screen photographs is obtained for the conditions investigated. The method predicts the classical pattern of vortical flow over a delta wing and transition to other flow patterns as the leading edge sweep angle and leading edge normal Mach number are varied. **EXPERIMENTAL DETERMINATION OF THE LAMINAR SEPARATION BUBBLE CHARACTERISTICS ON AN AIRFOIL AT LOW REYNOLDS NUMBERS**

M. M. OMEARA and T. J. MUELLER (Notre Dame, University, IN) AIAA and ASME, Fluid Mechanics, Plasma Dynamics and Lasers Conference, 4th, Atlanta, GA, May 12-14, 1986. 13 p. Research supported by the University of Notre Dame. refs
(Contract NSG-1419)
(AIAA PAPER 86-1065)

An experimental investigation was conducted in order to document the structure and behavior of laminar separation bubbles at low Reynolds numbers. Data of this type is necessary if the currently insufficient analytical and numerical models are to be improved. The laminar separation bubble which forms on a NACA 66(3)-018 airfoil model was surveyed at chord Reynolds numbers ranging from 50,000 to 200,000 at angles of attack from 8 to 12 degrees. The effects of the various testing conditions on the separation bubble were isolated, and the data was analyzed in relation to existing separation bubble correlations in order to test their low Reynolds number applicability. This analysis indicated that the chord Reynolds number and the disturbance environment strongly influence the experimental pressure distributions. These effects must be included in any analytic prediction technique applied to the low Reynolds number flight regime. Author

**EXPERIMENTAL STUDY OF A TURBULENT HORSESHOE VORTEX USING A THREE-COMPONENT LASER VELOCIMETER**

R. ABID and R. SCHMITT (ONERA, Chatillon-sous-Bagneux, France) AIAA and ASME, Fluid Mechanics, Plasma Dynamics and Lasers Conference, 4th, Atlanta, GA, May 12-14, 1986. 9 p. refs
(AIAA PAPER 86-1069)

The turbulent horseshoe vortex flow generated by a simplified wing-body junction has been experimentally studied. Oil surface flow visualization, static wall pressure measurements, and flow field measurements were made in the separated region upstream of the obstruction leading edge. Mean flow measurements on the plane of symmetry indicate that the three-dimensional separation was confined to a region near the plate. The region of reversed flow was approximately a fifth of the boundary layer thickness. The theoretical streamline pattern suggested by oil surface flow visualization is confirmed. C.D.

**THE INTERACTION BETWEEN A STRONG LONGITUDINAL VORTEX AND A TURBULENT BOUNDARY LAYER**

A. D. CUTLER and P. BRADSHAW (Imperial College of Science and Technology, London, England) AIAA and ASME, Fluid Mechanics, Plasma Dynamics and Lasers Conference, 4th, Atlanta, GA, May 12-14, 1986. 12 p. refs
(Contract NASW-581)
(AIAA PAPER 86-1071)

This paper presents the preliminary results of a long-term investigation of the interaction of strong longitudinal vortices with turbulent boundary layers. A pair of trailing vortices is generated by a delta wing, which is mounted ahead of a flat plate so that the trailing vortices merge with the boundary layer on the upper surface of the flat plate, while the non-rolled-up part of the delta-wing wake passes below the plate. This approximates an aircraft wing with a close-coupled canard. The measurements show how the boundary-layer fluid is first subjected to large cross flow and is then transported away from the plate to circulate around the vortex core. Author

**INFLUENCE OF NUMERICAL DISSIPATION IN COMPUTING SUPERSONIC VORTEX-DOMINATED FLOWS**

O. A. KANDIL and A. CHUANG (Old Dominion University, Norfolk, VA) AIAA and ASME, Fluid Mechanics, Plasma Dynamics and Lasers Conference, 4th, Atlanta, GA, May 12-14, 1986. 15 p. refs
(Contract NAG1-648; NAG1-591)
(AIAA PAPER 86-1073)

Steady supersonic vortex-dominated flows are solved using the unsteady Euler equations for conical and three-dimensional flows around sharp- and round-edged delta wings. The computational method is a finite-volume scheme which uses a four-stage Runge-Kutta time stepping with explicit second- and fourth-order dissipation terms. The grid is generated by a modified Joukowski transformation. The steady flow solution is obtained through time-stepping with initial conditions corresponding to the freestream conditions, and the bow shock is captured as a part of the solution. The scheme is applied to flat-plate and elliptic-section wings with a leading edge sweep of 70 deg at an angle of attack of 10 deg and a freestream Mach number of 2.0. Three grid sizes of 29 x 39, 65 x 65 and 100 x 100 have been used. The results for sharp-edged wings show that they are consistent with all grid sizes and variation of the artificial viscosity coefficients. The results for round-edged wings show that separated and attached flow solutions can be obtained by varying the artificial viscosity coefficients. They also show that the solutions are independent of the way time stepping is done. Local time-stepping and global minimum time-steeping produce same solutions. Author

**BLOCK-STRUCTURED SOLUTION OF EULER EQUATIONS FOR TRANSONIC FLOWS**

A. ECER, J. T. SPYROPOULOS, and V. RUBEK (Indiana University; Purdue University, Indianapolis) AIAA and ASME, Fluid Mechanics, Plasma Dynamics and Lasers Conference, 4th, Atlanta, GA, May 12-14, 1986. 10 p. refs
(Contract F49620-83-K-0034)
(AIAA PAPER 86-1080)

A block-structured solution scheme is developed for the solution of Euler equations for steady, three-dimensional, transonic flows. The Euler equations are expressed in terms of Clebsch variables. The resulting set of equations for conservation of mass, entropy (S) and the Clebsch variable eta are solved using a block-based relaxation scheme. The flow field is divided into a series of individual blocks representing local regions of the flow field. The employed grid generation scheme provides local refinement of each block, yet ensures one-to-one matching of grid points on the surfaces of adjoining blocks. For each of the blocks, either potential or Euler equations can be solved. For every block, the conservation of mass equation is solved to determine phi. For blocks with rotationality, two additional equations for determining S and eta are solved. The basic steps of the developed solution scheme are presented. The computational considerations involved in utilizing the present scheme are demonstrated with sample problems. Author

**THREE-DIMENSIONAL, CONSERVATIVE, EULER COMPUTATIONS USING PATCHED GRID SYSTEMS AND EXPLICIT METHODS**

K. A. HESSENIUS and M. M. RAI (NASA, Ames Research Center, Moffett Field, CA) AIAA and ASME, Fluid Mechanics, Plasma Dynamics and Lasers Conference, 4th, Atlanta, GA, May 12-14, 1986. 22 p. refs
(AIAA PAPER 86-1081)

The method of 'zonal approach' (in which the flow field is partitioned into regions with independent grids) for computation of flow over complex geometries, such as aircraft configuration, requires application of a grid-interfacing procedure. A three-dimensional conservative, boundary scheme for patched grids, applicable in generalized coordinates for arbitrary point distributions on a planar zonal surface is presented. The computation technique is derived within the framework of the Osher (1983) upwind scheme, using Euler equations. The three-dimensional interfacing method is applied to the computation of flow about a wing-canard combination using a two-zone, patched grid. I.S.

**TRANSONIC FLOW SOLUTIONS ON A BLUNT, FINNED BODY OF REVOLUTION USING THE EULER EQUATIONS**

L. E. LIJEWSKI (USAF, Armament Laboratory, Eglin AFB, FL) AIAA and ASME, Fluid Mechanics, Plasma Dynamics and Lasers Conference, 4th, Atlanta, GA, May 12-14, 1986. 10 p. refs
(AIAA PAPER 86-1082)

Pressure distribution and force and moment calculations are presented for a cruciform, finned body of revolution at angles of attack up to 15 deg. Near sonic conditions at Mach 0.95 are successfully predicted, and preliminary design quality force and moment coefficients are calculated. Crossflow velocity vector plots are presented to substantiate the complex flowfield at angle of attack. Strong vortical flow is captured up to 9-deg angle of attack. An elliptic grid generator and explicit upwind Euler solver were used on a CRAY-XMP to obtain results presented. The paper illustrates the inviscid code's capability to predict aerodynamic characteristics on a geometrically complex configuration at near sonic conditions and moderate angles of attack. Author

**A86-38446#**

**TRANSONIC POTENTIAL FLOW CALCULATIONS BY TWO ARTIFICIAL DENSITY METHODS**

G. VOLPE (Grumman Corporate Research Center, Bethpage, NY) and A. JAMESON (Princeton University, NJ) AIAA and ASME, Fluid Mechanics, Plasma Dynamics and Lasers Conference, 4th, Atlanta, GA, May 12-14, 1986. 8 p. refs
(AIAA PAPER 86-1084)

A steady transonic flow over an airfoil is computed by solving the full potential equation discretized over a contour-fitting grid in full conservation form. Near shock waves, the density is corrected to account for the rise in entropy in the region. A multigrid alternating direction method is used to drive the iteration. In supersonic flow regions, artificial dissipation is introduced either by a flux biasing scheme or by a density biasing scheme. The two schemes are second order accurate, while the density biasing scheme is second order accurate throughout the flow field except for a small region near shock waves. Results of calculations with the two schemes show that the flux biasing scheme gives a sharper resolution of the shock than the density biasing scheme when the shock itself is weak. As shock strength increases, the shock-capturing abilities of the two schemes become equal. Throughout the range of cases tested, the two schemes exhibited comparable speed and robustness. Author

### EFFECTS OF WIND-TUNNEL NOISE ON SWEPT-CYLINDER TRANSITION AT MACH 3.5

T. R. CREEL, JR., I. E. BECKWITH, and F.-J. CHEN (NASA, Langley Research Center, Hampton, VA) AIAA and ASME, Fluid Mechanics, Plasma Dynamics and Lasers Conference, 4th, Atlanta, GA, May 12-14, 1986. 20 p. refs
(AIAA PAPER 86-1085)

Transition data are reported for circular cylinders at swept angles of 45 and 60 degrees in the Mach 3.5 pilot-low-disturbance tunnel where free-stream noise levels are varied from approximately .05-0.5 percent in terms of the rms fluctuating pressure normalized by the mean static pressure. Results indicate that end plate or boundary layer trip disturbances at the upstream end of the cylinders cause turbulent flow along the entire test Reynolds number range of 10-170 thousand per inch. With all end plate and trip disturbances removed, transition at the attachment lines occurred at free-stream Reynolds numbers based on diameters of about 70-80 thousand, independent of stream noise levels. The installation of small trips on the attachement lines caused transition at lower Reynolds numbers, depending on both the roughness height and the wind tunnel noise level. R.R.

### EFFECTS OF CONE SURFACE WAVINESS AND FREESTREAM NOISE ON TRANSITION IN SUPERSONIC FLOW

E. L. MORRISETTE, T. R. CREEL, JR., and F.-J. CHEN (NASA, Langley Research Center, Hampton, VA) AIAA and ASME, Fluid Mechanics, Plasma Dynamics and Lasers Conference, 4th, Atlanta, GA, May 12-14, 1986. 7 p. refs
(AIAA PAPER 86-1086)

A comparison of transition on wavy-wall and smooth-wall cones in a Mach 3.5 wind tunnel is made under conditions of either low freestream noise (quiet flow) or high freestream noise (noisy flow). The noisy flow compares to that found in conventional wind tunnels while the quiet flow gives transitional Reynolds numbers on smooth sharp cones comparable to those found in flight. The waves were found to have a much smaller effect on transition than similar sized trip wires. A satisfactory correlating parameter for the effect of waves on transition was simply the wave height-to-length ratio. A given value of this ratio was found to cause the same percentage change in transition location in quiet and noisy flows. Author

### LAMINAR BOUNDARY LAYER STABILITY EXPERIMENTS ON A CONE AT MACH 8. IV - ON UNIT REYNOLDS NUMBER AND ENVIRONMENTAL EFFECTS

K. F. STETSON (USAF, Flight Dynamics Laboratory, Wright-Patterson AFB, OH), E. R. THOMPSON (USAF, Arnold Engineering Development Center, Arnold Air Force Station, TN), J. C. DONALDSON, and L. G. SILER (Calspan Field Servces, Inc., Arnold Air Force Station, TN) AIAA and ASME, Fluid Mechanics, Plasma Dynamics and Lasers Conference, 4th, Atlanta, GA, May 12-14, 1986. 29 p. refs
(AIAA PAPER 86-1087)

Hot wire anemometry is used to experimentally investigate the laminar boundary layer stability of a sharp, 7-deg half angle cone at a freestream Mach value of 8, with attention to the influences of the disturbance environment and unit Reynolds number on boundary layer disturbance growth. The spectral content of the environmental disturbances, and the upper frequency limit for excitation of the boundary layer disturbances are noted to be especially important, with the most important of the environmental disturbances being those of the same frequency as the most unstable boundary layer frequencies. Changing the unit Reynolds number by a factor of 4 did not change the stability characteristics of the boundary layer for frequencies at which environmental excitation was adequate. O.C.

**A86-38450#**

### WALL COOLING EFFECTS ON HYPERSONIC BOUNDARY LAYER TRANSITION, M(1) = 7.5 - 15

H. T. NAGAMATSU (Rensselaer Polytechnic Institute, Troy, NY), R. E. SHEER, JR. (GE Research and Development Center, Schenectady, NY), and D. C. WISLER (GE Fluid Mechanics Laboratory, Evendale, OH) AIAA and ASME, Fluid Mechanics, Plasma Dynamics and Lasers Conference, 4th, Atlanta, GA, May 12-14, 1986. 11 p. refs
(AIAA PAPER 86-1088)

An investigation was conducted in a hypersonic shock tunnel over a Mach number range of 7.5 to 15 to study the effect of wall cooling and surface roughness on laminar boundary layer transition of an 8-ft cone having a 10-deg angle. The stagnation temperature was held approximately constant at 2500 K throughout the investigation, to produce a model wall temperature to stagnation temperature ratio of 0.12. Fast response thin film surface heat transfer gauges were the primary instruments used to detect transition and the passage of turbulent bursts which always appeared at the beginning of the transition region. Pitot-tube, total temperature, and wedge probe heat transfer surveys were made through the boundary layer to verify the interpretation of the surface heat transfer results. The turbulent theory (which included both the density and velocity fluctuation terms) and the laminar theory agreed well with the experiment. The rate of increase for the beginning and end of transition Reynolds number becomes progressively less as freestream Mach number increases above 9. Decreasing the wall-to-stagnation temperature ratio from 0.214 to 0.12, for a 10-deg cone, did not affect the transition Reynolds number. Author

(Contract DAAG29-85-C-0002)
(AIAA PAPER 86-1095)

A multi block zonal algorithm which solves the thin-layer Navier-Stokes and the Euler equations is used to numerically simulate the formation and roll-up of the tip vortex in both subsonic and transonic flows. Four test cases which used small and large aspect ratio wings have been considered to examine the influence of the tip-cap shape, the tip planform and the free-stream Mach number. It appears that both the tip-planform and the tip-cap shape have some influence on the formation of the tip vortex, but its subsequent roll-up seems to be more influenced by the tip-planform shape. In general, a good definition of the formation and the roll-up of the tip vortex has been observed for all the cases considered here. Comparions of the numerical results with the limited, available experimental data show good agreement with both the surface pressures and the tip-vortex strength. Author

**VISUALIZATION OF WING TIP VORTICES IN UNSTEADY AND STEADY WIND**
P. FREYMUTH, F. FINAISH, and W. BANK (Colorado, University, Boulder) AIAA and ASME, Fluid Mechanics, Plasma Dynamics and Lasers Conference, 4th, Atlanta, GA, May 12-14, 1986. 12 p. refs
(Contract F49620-84-C-0065)
(AIAA PAPER 86-1096)

Streakline visualization by smoke near the tip of a rectangular half-wing which protrudes into the center of a wind tunnel test section from the top wall has been conducted at angles of attack 10 deg, 20 deg and 30 deg. The tunnel was either operated in the mode of an accelerating flow starting from rest or in a steady speed mode. The visualizations suggest a novel wing tip vortex system. Vorticity generated at the pressure side of the wing forms a conical tip vortex with its apex at the front corner of wing tip. Another conical tip vortex with the same apex location forms further inboard from vorticity generated at the suction side of the wing. Author

**THREE-DIMENSIONAL UNSTEADY FLOW FIELDS ELICITED BY A PITCHING FORWARD SWEPT WING**
J. ASHWORTH, M. WALTRIP, and M. W. LUTTGES (Colorado, University, Boulder) AIAA and ASME, Fluid Mechanics, Plasma Dynamics and Lasers Conference, 4th, Atlanta, GA, May 12-14, 1986. 10 p. refs
(Contract F49620-83-K-0009)
(AIAA PAPER 86-1104)

The three-dimensional flow field about a forward swept, NACA 0015 wing was studied using multiple exposure, phase-locked flow visualization. The flow was viewed from orthogonal perspectives. The wing was oscillated sinusoidally in pitch while stroboscopic photography was used to record the pitching-dependent alterations in flow field structure. Flow interactions were visualized in discrete fashion for a variety of spanwise views, using different k values and mean angle of attack. The major flow field characteristics of the dynamically oscillating swept forward wing were the tip and the leading edge vortices. The strong helical tip flow vortices dominated most of the observed flow structures near the wing tip across all test conditions. The far inboard span locations were dominated by flows related to the leading edge vortex. Whereas the swept forward wing elicits flow structures that are qualitatively predictable from previous research, the magnitude and interaction of these flow structures were quite different. The spatial domain of the flows was quite pronounced and seemed to be specific to the wing geometry of the test configuration. Author

**UNSTEADY AERODYNAMICS OF RAPIDLY PITCHED AIRFOILS**
J. C. WU, I. H. TUNCER (Georgia Institute of Technology, Atlanta), and C. M. WANG AIAA and ASME, Fluid Mechanics, Plasma Dynamics and Lasers Conference, 4th, Atlanta, GA, May 12-14, 1986. 14 p. refs
(Contract AF-AFOSR-86-0121)
(AIAA PAPER 86-1105)

The problem of dynamic stall of an airfoil pitched rapidly at a constant rate to large angles of attack is studied computationally. Flow patterns, pressure distributions on the airfoil surface, histories of the lift, the drag and the moment experienced by the airfoil are computed and examined. The computed results are shown to be in good agreement with available experimental data. Author

**PROGRESS IN THE DEVELOPMENT OF PARABOLIZED NAVIER-STOKES (PNS) METHODOLOGY FOR ANALYZING PROPULSIVE JET MIXING PROBLEMS**
S. M. DASH, D. E. WOLF, N. SINHA, and S. H. LEE (Science Applications International Corp., Propulsion Gas Dynamics Div., Princeton, NJ) AIAA and ASME, Fluid Mechanics, Plasma Dynamics and Lasers Conference, 4th, Atlanta, GA, May 12-14, 1986. 24 p. refs
(Contract NAS1-16535)
(AIAA PAPER 86-1115)

A brief review of 2D PNS methodology is first presented which describes the specialized features of supersonic shock-capturing and subsonic pressure-split models required for the analysis of aircraft, rocket and scramjet jet mixing problems. These features include techniques for dealing with various types of embedded and interfacing subsonic regions, the inclusion of finite-rate chemistry and the direct-coupling with potential flow solutions. Preliminary 3D extensions of this PNS methodology geared to supersonic and subsonic rectangular free jet mixing problems are also reviewed. New 3D PNS work will be described which includes the development of a hybrid supersonic/subsonic free jet mixing model, and, a supersonic model geared to the analysis of turbulent mixing and combustion processes occurring in scramjet combustor/nozzle flowfields. **AN INVESTIGATION OF THE EFFECTS OF THE PROPELLER SLIPSTREAM OF A LAMINAR WING BOUNDARY LAYER**
R. M. HOWARD, S. J. MILEY (Texas A & M University, College Station), and B. J. HOLMES (NASA, Langley Research Center, Hampton, VA) IN: General aviation aircraft aerodynamics; Proceedings of the General Aviation Aircraft Meeting and Exposition, Wichita, KS, April 16-19, 1985 . Warrendale, PA, Society of Automotive Engineers, Inc., 1985, p. 1-12. refs
(Contract NAG1-344)
(SAE PAPER 850859)

A research program is in progress to study the effects of the propeller slipstream on natural laminar flow. Flight and wind tunnel measurements of the wing boundary layer have been made using hot-film velocity sensor probes. The results show the boundary layer, at any given point, to alternate between laminar and turbulent states. This cyclic behavior is due to periodic external flow turbulence originating from the viscous wake of the propeller blades. Analytic studies show the cyclic laminar/turbulent boundary layer to result in a significantly lower wing section drag than a fully turbulent boundary layer. The application of natural laminar flow design philosophy yields drag reduction benefits in the slipstream affected regions of the airframe, as well as the unaffected regions. Author

**AN EXPERIMENTAL STUDY OF A GENERAL AVIATION SINGLE-ENGINE AIRCRAFT UTILIZING A NATURAL LAMINAR FLOW WING**
C. OSTOWARI and D. A. NAIK (Texas A & M University, College Station) IN: General aviation aircraft aerodynamics; Proceedings of the General Aviation Aircraft Meeting and Exposition, Wichita, KS, April 16-19, 1985 . Warrendale, PA, Society of Automotive Engineers, Inc., 1985, p. 23-35. refs
(SAE PAPER 850861)

Force and moment measurements, and surface flow patterns have been obtained for a one-fifth scale model of a single-engine general aviation aircraft utilizing a 15-percent thick natural laminar flow wing section. The data is for typical pre- and poststall angles of attack, aircraft yaw attitudes, surface roughness and Reynolds number conditions. Results from a separate study of the wing alone are also given for comparison. This comparison shows that the fuselage/tail assembly acts as a lifting body. The aerodynamic characteristics show marked deterioration with increasing surface roughness. In addition, the studies indicate that the transition on the wing is characterized by laminar short bubble separation. The aerodynamic characteristics are somewhat unaffected by the presence of minitufts. The flow visualization photographs clearly show the transition and separation regions, and document the effects of variations in angle of attack and yaw on wing body interference. Author

**NATURAL LAMINAR FLOW AND REGIONAL AIRCRAFT**

K. L. WILLIAMS, P. VIJGEN, and J. ROSKAM (Kansas, University, Lawrence) IN: General aviation aircraft aerodynamics; Proceedings of the General Aviation Aircraft Meeting and Exposition, Wichita, KS, April 16-19, 1985 . Warrendale, PA, Society of Automotive Engineers, Inc., 1985, p. 61-71. refs
(SAE PAPER 850864)

Work done under a NASA-Langley grant at the University of Kansas Flight Research Laboratory in the area of natural laminar flow and regional aircraft is described. The focus is on the application of natural laminar flow over various major wetted areas. In particular, efforts were concentrated on analyzing the potential benefits of achieving extensive laminar flow on the wing, empennage, and fuselage. The effect of the presence of large amounts of laminar flow is evaluated in terms of performance and efficiency improvement over an all-turbulent baseline aircraft. An introduction is given to the concept of regional aircraft, and the aerodynamic characteristics are compared to those of other airplane classes. Some recent aerodynamic developments are presented that justify, to a certain extent, the assumptions made concerning the amount of natural laminar flow that is possible for each surface. Application of a cruise/climb flap to advanced medium-speed natural laminar flow airfoils is also discussed. Author

**ANALYTICAL STUDY OF THREE-SURFACE LIFTING SYSTEMS**

K. ROKHSAZ and B. P. SELBERG (Missouri-Rolla, University, Rolla) IN: General aviation aircraft aerodynamics; Proceedings of the General Aviation Aircraft Meeting and Exposition, Wichita, KS, April 16-19, 1985 . Warrendale, PA, Society of Automotive Engineers, Inc., 1985, p. 85-94. refs
(SAE PAPER 850866)

Conventional, canard, and three surface aircraft configurations are investigated analytically to determine each configuration's induced drag, as well as the pressure and viscous drag. A vortex panel method in conjunction with momentum integral boundary layer method is used to predict inviscid and viscous characteristics. Vortex lattice methods are used to trim the aircraft as well as to predict the induced drag of each configuration. Viscous and induced drag results are presented for two different payloads, a six-place and a twelve-place configuration. For both payloads the conventional configuration had the highest lift over drag. However, the canard and the three surface were close enough to warrant consideration based on other criteria. Author

**LIFTING SURFACE THEORY FOR THE REST OF US**

B. VAN NIEKERK (Stanford University, CA) IN: Structures, Structural Dynamics and Materials Conference, 27th, San Antonio, TX, May 19-21, 1986, Technical Papers. Part 1 . New York, American Institute of Aeronautics and Astronautics, 1986, p. 739-745. refs
(Contract AF-AFOSR-84-0099)
(AIAA PAPER 86-1025)

A rational approach to lifting theory is presented. It is shown that a special numerical integration rule can be found to directly compute the finite part of the characteristic double pole singular integrals found in subsonic lifting surface theories. This is coupled with an optimum weighted residual method which ensures rapid convergence of the aerodynamic generalized forces. The versatility of these techniques is demonstrated by computing the time accurate unsteady airloads on three-dimensional wings. Author

**UNSTEADY TRANSONIC FLOW CALCULATIONS FOR WING-FUSELAGE CONFIGURATIONS**

J. T. BATINA (NASA, Langley Research Center, Hampton, VA) IN: Structures, Structural Dynamics and Materials Conference, 27th, San Antonio, TX, May 19-21, 1986, Technical Papers. Part 2 . New York, American Institute of Aeronautics and Astronautics, 1986, p. 142-155. refs
(AIAA PAPER 86-0862)

The development of the XTRAN3S wing fuselage capability for predicting transonic unsteady aerodynamic loads for aeroplastic applications is described. The modifications of the XTRAN3S code, and XTRAN3S fuselage modeling based on an alternating-direction implicit finite-difference algorithm for solving a modified transonic small-disturbance equation, are analyzed. The XTRAN3S transonic code is applied to the steady and unsteady calculations for three wing-fuselage configurations and a transport-type wing-fuselage model. The effects of fuselage aerodynamic interference on the transonic unsteady air load and flutter characteristics of wings are investigated. Good correlation is detected for the calculated and experimental pressure distributions of the models confirming the validity of the code. I.F.

**NONISENTROPIC UNSTEADY THREE DIMENSIONAL SMALL DISTURBANCE POTENTIAL THEORY**

M. D. GIBBONS, M. H. WILLIAMS (Purdue University, West Lafayette, IN), and W. WHITLOW, JR. (NASA, Langley Research Center, Hampton, VA) IN: Structures, Structural Dynamics and Materials Conference, 27th, San Antonio, TX, May 19-21, 1986, Technical Papers. Part 2 . New York, American Institute of Aeronautics and Astronautics, 1986, p. 156-165. refs
(Contract NAG1-372)
(AIAA PAPER 86-0863)

Nonisentropic modifications to the three-dimensional transonic small disturbance (TSD) theory, which allows for more accurate modeling of transonic flow fields, are described. The modified flux equation and entropy corrections are presented; the Engquist-Osher differencing (1980) is added to the solution algorithm in order to eliminate the velocity overshoots upstream of shocks. The modified theory is tested in the XTRAN3S finite difference computer code. Steady flows over a rectangular NACA 0012 wing with an aspect ratio of 12 are calculated and compared to Euler equation solutions; good correlation is observed between the data and the modified TSD theory provides more accurate data, particularly for the lift curve slope. The nonisentropic theory is evaluated on an RAE tailplane model for steady and unsteady flows and the modified theory results agree well with the experimental data. I.F.

**A NEW APPROACH TO FINITE STATE MODELLING OF UNSTEADY AERODYNAMICS**

C. VENKATESAN and P. P. FRIEDMANN (California, University, Los Angeles) IN: Structures, Structural Dynamics and Materials Conference, 27th, San Antonio, TX, May 19-21, 1986, Technical Papers. Part 2 . New York, American Institute of Aeronautics and Astronautics, 1986, p. 178-191. refs
(Contract NAG2-209)
(AIAA PAPER 86-0865)

This paper presents a novel technique for formulating a high quality finite state unsteady aerodynamic model by applying Bode plot methods, used in control engineering. Indicial response functions for both fixed wing and rotary wing applications are obtained using these finite state unsteady aerodynamic models. It is shown that the rotary wing indicial response function has a fundamentally different characteristic when compared to fixed wing indicial response. The rotary wing indicial response function is oscillatory in nature while the fixed wing indicial response function is nonoscillatory. Furthermore it should be emphasized that this is the first that a rotary-wing indicial response function has been presented in the literature. Author

**A CALCULATION METHOD FOR UNSTEADY AERODYNAMIC FORCES IN THE LAPLACE DOMAIN AND ITS APPLICATION TO ROOT LOCI**

T. UEDA (National Aerospace Laboratory, Chofu, Japan) IN: Structures, Structural Dynamics and Materials Conference, 27th, San Antonio, TX, May 19-21, 1986, Technical Papers. Part 2 . New York, American Institute of Aeronautics and Astronautics, 1986, p. 192-200. refs
(AIAA PAPER 86-0866)

A method for obtaining unsteady aerodynamic forces acting on a subsonic thin finite wing is presented. The unsteady forces are numerically evaluated as a function of the Laplace transform variable s which corresponds to arbitrary, as well as harmonic, motion of a wing. Computation is possible on the entire s-plane except for a branch cut on the negative real axis. The method proposed is based on the doublet point method so that the wing planform may be arbitrary including practical control surfaces. The exact forces obtained for the Laplace variable are applied to determine root loci of a wind tunnel wing model. Comparison of the results with those by the finite state aerodynamic modeling shows good accuracy of Roger's approximation. The effect of compressibility is also examined to reveal that the aerodynamic root does exist for a high subsonic flow range. Author

**AN EXPERIMENTAL STUDY OF THE AERODYNAMICS OF INCIPIENT TORSIONAL STALL FLUTTER**

F. O. CARTA and P. F. LORBER (United Technologies Research Center, East Hartford, CT) IN: Structures, Structural Dynamics and Materials Conference, 27th, San Antonio, TX, May 19-21, 1986, Technical Papers. Part 2 . New York, American Institute of Aeronautics and Astronautics, 1986, p. 303-313. refs
(AIAA PAPER 86-0901)

An experimental study has been made of the aerodynamics of small amplitude airfoil torsional oscillations near stall to examine the mechanism that leads to stall flutter on propeller blades. An airfoil was oscillated in pitch at amplitudes of 0.5, 2.0, and 4.0 deg. Time histories of the unsteady surface pressures show that stall initiation and reattachment at low amplitudes are determined not only by kinematic conditions but also by the presence or absence of random effects such as gusts or vibrations. In contrast to the results at higher amplitude, hysteresis loops at low amplitude near stall are dominated by a central destabilizing subloop, so that the aerodynamic pitch damping per unit amplitude has a maximum negative value near an amplitude of 2 deg. This implies that small amplitude oscillations near stall may be extremely unstable. The measured aerodynamic damping is used in a model calculation to predict the growth rate of torsional oscillations of an airfoil free to oscillate in pitch. An initial small torsional disturbance grows rapidly and then asymptotically approaches a limiting amplitude, similar to behavior observed during stall flutter. Author

**A COMPUTATIONAL TRANSONIC FLUTTER BOUNDARY TRACKING PROCEDURE**

J. W. GALLMAN, T. Y. YANG (Purdue University, West Lafayette, IN), and J. T. BATINA (NASA, Langley Research Center, Hampton, VA) IN: Structures, Structural Dynamics and Materials Conference, 27th, San Antonio, TX, May 19-21, 1986, Technical Papers. Part 2 . New York, American Institute of Aeronautics and Astronautics, 1986, p. 314-324. refs
(Contract NAG1-372)
(AIAA PAPER 86-0902)

An automated flutter boundary tracking procedure is presented for the efficient calculation of transonic flutter boundaries. The new procedure uses aeroelastic responses to march along the boundary by taking steps in speed and Mach number, thereby reducing the number of response calculations previously required to determine a transonic flutter boundary. The tracking procedure reduces computational costs since only two response calculations are required per Mach number and provides a complete boundary in a single job submission. Flutter boundary results are presented for a typical airfoil section oscillating with pitch and plunge degrees of freedom. These transonic flutter boundaries are in good agreement with 'exact' boundaries calculated using the conventional time-marching method. The tracking procedure was also extended to include static aeroelastic twist as a simulation of the static deformation of a wing and thus contains all of the essential features that are required to apply it to practical three-dimensional cases. Application of the procedure is also made to flutter boundaries as a function of structural parameters, the capability of which is useful as a design tool. Author

**TRANSONIC AEROELASTICITY OF WINGS WITH TIP STORES**

G. P. GURUSWAMY (Sterling Software/Informatics, Palo Alto, CA), P. M. GOORJIAN (NASA, Ames Research Center, Moffett Field, CA), and E. L. TU IN: Structures, Structural Dynamics and Materials Conference, 27th, San Antonio, TX, May 19-21, 1986, Technical Papers. Part 2 . New York, American Institute of Aeronautics and Astronautics, 1986, p. 672-683. USAF-supported research. refs
(AIAA PAPER 86-1007)

The presence of tip stores influences both aerodynamic and aeroelastic performances of wings. Such effects are more pronounced in the transonic regime. In this study, transonic aeroelasticity of wings with tip stores is studied for the first time by a theoretical method using the unsteady-small disturbance transonic aerodynamic equations coupled with modal structural equations of motion. The aerodynamic and structural equations of motion are simultaneously integrated by a time-accurate numerical scheme. To validate the tip store simulation, aeroelastic computations are made for a typical rectangular wing with a tip store and results are correlated with available wind tunnel data for the corresponding wing without a tip store at various flight conditions. Aeroelastic computations are also made for a typical fighter wing with a tip store. Present computations show that it is important to account for the aerodynamics of the tip store, particularly in the transonic regime where the tip store can make the wing aeroelastically unstable. **THE INDIRECT BOUNDARY INTEGRAL FORMULATION FOR ELLIPTIC, HYPERBOLIC AND NON-LINEAR FLUID FLOWS**

B. HUNT and B. L. HEWITT (British Aerospace, PLC, Aircraft Group, Preston, England) IN: Developments in boundary element methods - 4 . London and New York, Elsevier Applied Science Publishers, 1986, p. 227-339. refs

Three distinct aspects of the boundary integral method for fluid flows are examined in detail. The fundamental physics are discussed first, showing how one of the practical boundary integral models employed in routine aerodynamic applications for incompressible irrotational flows may be interpreted in purely physical terms. Then, a detailed mathematical analysis of the linearized elliptic formulation is given which leads to the so-called 'indirect' boundary integral formulation permitting source and vorticity distributions of very low order to be used to give accurate by economical solutions. Finally, an extensive discussion of the linearized hyperbolic flow problem indicates how methodologies have been developed which allow boundary integral formulations to be successfully applied to the hyperbolic flow problem. C.D.

**COMPUTATION OF TRANSONIC FLOW ABOUT HELICOPTER ROTOR BLADES**
R. ARIELI, M. E. TAUBER (NASA, Ames Research Center, Moffett Field, CA), D. A. SAUNDERS (Informatics General Corp., Palo Alto, CA), and D. A. CAUGHEY (Cornell University, Ithaca, NY) AIAA Journal (ISSN 0001-1452), vol. 24, May 1986, p. 722-727. refs

An inviscid, nonconservative, three-dimensional full-potential flow code, ROT22, has been developed for computing the quasi-steady flow about a lifting rotor blade. The code is valid throughout the subsonic and transonic regime. Calculations from the code are compared with detailed laser velocimeter measurements made in the tip region of a nonlifting rotor at a tip Mach number of 0.95 and zero advance ratio. In addition, comparisons are made with chordwise surface pressure measurements obtained in a wind tunnel for a nonlifting rotor blade at transonic tip speeds at advance ratios from 0.40 to 0.50. The overall agreement between theoretical calculations and experiment is very good. A typical run on a CRAY X-MP computer requires about 30 CPU seconds for one rotor position at transonic tip speed. Author

**A METHOD FOR THE DESIGN OF SHOCK-FREE SLENDER BODIES OF REVOLUTION**
A. A. HASSAN (Arizona State University, Tempe) AIAA Journal (ISSN 0001-1452), vol. 24, May 1986, p. 728-734. refs

A numerical procedure is presented for the design of shock-free supercritical slender bodies of revolution. The procedure relies on the fact that for small disturbances a hodograph-like transformation (not known a priori) can be applied to the axisymmetric potential equation. This results in a set of two coupled Poisson equations defined on a common rectangular domain. With the special variables used, the system of coupled equations for the subsonic portion of the flow is solved iteratively using a fast Poisson solver. This in turn, defines the mapping of the subsonic or subsonic-sonic boundary in the physical plane. For supercritical flows, the supersonic portion of the flow is calculated from data on the sonic line using an axisymmetric characteristic calculation. This is followed by a map to the physical plane to determine the shape of the body under the sonic bubble. Examples of shock-free supercritical slender body designs are presented and show good agreement with the direct computation of the flow past the designed slender bodies. Author

**HEAT TRANSFER AND DRAG OF A BODY IN THE FAR SUPERSONIC WAKE [TEPLOOBMEN I SOPROTIVLENIE TELA, RASPOLOZHENNOGO V DAL'NEM SVERKHZVUKOVOM SLEDE]**
I. G. EREMEITSEV and N. N. PILIUGIN Akademiia Nauk SSSR, Izvestiia, Mekhanika Zhidkosti i Gaza (ISSN 0568-5281), Mar.-Apr. 1986, p. 60-67. In Russian. refs

Generalized formulas are obtained which provide a convenient way to make mass calculations of convective heat fluxes toward bodies and their drag in wake-type inhomogeneous flows. Attention is also given to the formation of a return-circulation zone at the frontal surface of the body. A comparison of the results obtained with real parameters of a far wake has shown that the nonseparated flow region is sufficiently large. The effect of flow inhomogeneity on the local and integral flow characteristics is examined. V.L.

**RECURRENT IDENTIFICATION OF UNSTEADY AERODYNAMIC FORCES OF ELASTIC VEHICLES**
X. XIONG (Northwestern Polytechnical University, Xian, People's Republic of China) Acta Aeronautica et Astronautica Sinica, vol. 7, April 1986, p. 121-127. In Chinese, with abstract in English.

A method for identifying the unsteady aerodynamic forces of elastic vehicles is presented. A standard measurement equation satisfied by aerodynamic indicial functions is derived from longitudinal small-disturbance equations of elastic vehicles with unsteady aerodynamic forces described by Duhamel's integral. The discrete values of aerodynamic indicial functions in time domain are obtained by using the recurrent filter technique. In comparison with other methods, this method has the following advantages: (1) the ability to take the effects of structural deformation into account; (2) the capability to identify the unsteady aerodynamic parameters of the whole vehicle; (3) ease in collecting initial data; and (4) simplicity of calculations. Finally, some results of the preliminary calculation for a vehicle are given. Author

**PLUME CHARACTERISTICS OF SINGLE-STREAM AND DUAL-FLOW CONVENTIONAL AND INVERTED-PROFILE NOZZLES AT EQUAL THRUST**
U. H. VONGLAHN and J. H. GOODYKOONTZ 1986 39 p refs Presented at the 4th Applied Aerodynamics Conference, San Diego, Calif. 9-11 Jun. 1986; sponsored by AIAA
(NASA-TM-87323; E-3060; NAS 1.15:87323; AIAA-86-1809)
Avail: NTIS HC A03/MF A01 CSCL 01A

The plume velocity and temperature decay rates of single-stream, conventional dual-flow and inverted-profile dual-flow nozzles are compared at equal values of ideal thrust over a wide range of flow conditions. The comparisons are made in terms of constant velocity and temperature contour maps. The results show that both dual-flow nozzle types have much greater plume velocity and temperature decay rates than those of equivalent thrust single-stream nozzles when the respective secondary flows were at ambient temperature. With hot secondary flows, the inverted-profile dual-flow plumes decayed significantly faster than those of single-stream nozzles; however, the decay rates for the conventional dual-flow streams were about the same as those for the single-stream nozzles. Consequently, with hot secondary flows, the inverted-profile dual-flow plumes decayed much faster than the conventional dual-flow plumes at equal thrust. Author

**ANALYSIS OF TRANSITIONAL SEPARATION BUBBLES ON INFINITE SWEPT WINGS**

R. L. DAVIS and J. E. CARTER Washington Jun. 1986 39 p refs
(Contract NAS1-16585)
(NASA-CR-3956; NAS 1.26:3956) Avail: NTIS HC A03/MF A01 CSCL 01A

A previously developed two-dimensional local inviscid-viscous interaction technique for the analysis of airfoil transitional separation bubbles, ALESEP (Airfoil Leading Edge Separation), has been extended for the calculation of transitional separation bubbles over infinite swept wings. As part of this effort, Roberts' empirical correlation, which is interpreted as a separated flow empirical extension of Mack's stability theory for attached flows, has been incorporated into the ALESEP procedure for the prediction of the transition location within the separation bubble. In addition, the viscous procedure used in the ALESEP techniques has been modified to allow for wall suction. A series of two-dimensional calculations is presented as a verification of the prediction capability of the interaction techniques with the Roberts' transition model. Numerical tests have shown that this two-dimensional natural transition correlation may also be applied to transitional separation bubbles over infinite swept wings. Results of the interaction procedure are compared with Horton's detailed experimental data for separated flow over a swept plate which demonstrates the accuracy of the present technique. Wall suction has been applied to a similar interaction calculation to demonstrate its effect on the separation bubble. The principal conclusion of this paper is that the prediction of transitional separation bubbles over two-dimensional or infinite swept geometries is now possible using the present interacting boundary layer approach. **TABLES FOR CORRECTING AIRFOIL DATA OBTAINED IN THE LANGLEY 0.3-METER TRANSONIC CRYOGENIC TUNNEL FOR SIDEWALL BOUNDARY-LAYER EFFECTS**

R. V. JENKINS and J. B. ADCOCK Jun. 1986 16 p refs
(NASA-TM-87723; NAS 1.15:87723) Avail: NTIS HC A02/MF A01 CSCL 01A

Tables for correcting airfoil data taken in the Langley 0.3-meter Transonic Cryogenic Tunnel for the presence of sidewall boundary layer are presented. The corrected Mach number and the correction factor are minutely altered by a 20 percent change in the boundary layer virtual origin distance. The sidewall boundary layer displacement thicknesses measured for perforated sidewall inserts and without boundary layer removal agree with the values calculated for solid sidewalls. Author

**THE EFFECTS ON ROTOR NONUNIFORM INFLOW HARMONIC CONTENT OF UNEVEN CIRCUMFERENTIAL DISTRIBUTION OF JET ENGINE INLET GUIDE VANES**

M. R. HINSMAN Jan. 1986 39 p refs
(Contract N00024-85-C-6041)
(AD-A164629) Avail: NTIS HC A03/MF A01 CSCL 20D

A computative parametric study was conducted to investigate the effects of vane section geometry, vane number, and primarily, uneven circumferential vane spacing on the harmonic content of the wake field produced by a row of jet engine inlet guide vanes (IGV). As parameters were varied, the harmonic content of the resulting wake field was analyzed for its potential effect on unsteady pressures at the rotor. A semi-empirical model is presented which was used to generate the two-dimensional flow field downstream of the IGV plane. Results show that uneven angular spacing of IGV should not be employed for reducing unsteady pressures experienced by the rotor. In fact, manufacturing tolerances, relative to IGV angular location, of evenly spaced vanes should be minimized to minimize unsteady pressures. GRA

**LAMINAR AND TURBULENT BOUNDARY-LAYER CALCULATIONS ON THE LEEWARD SURFACE OF A SLENDER DELTA WING AT INCIDENCE**

A. C. DEBRUIN 13 Apr. 1984 20 p Submitted for publication
(NLR-MP-84040-U; B8577053; ESA-86-96969) Avail: NTIS HC A02/MF A01

The boundary layer on the leeward surface of a slender delta wing at incidence was calculated for fully laminar flow and the case with artificial boundary layer tripping at the 50% semispan location. The behavior of the predicted boundary layer properties is qualitatively in good agreement with experimental observations. The rather large difference between the potential flow and experimental pressure distribution causes a discrepancy between the predicted and the experimentally observed location of secondary separation. It is expected that the potential flow pressure distribution can be improved when the leading-edge and the secondary separation vortex sheet are correctly modeled in the potential flow calculation method. (NASA-TM-88768; NAS 1.15:88768; AGARD-AR-222; ISBN-92-835-1515-3) Avail: NTIS HC A02/MF A01 CSCL 01A

From May 6 to 9, 1985, the Fluid Dynamics Panel and Flight Mechanics Panel of AGARD jointly arranged a Symposium on Unsteady Aerodynamics-Fundamentals and Applications to Aircraft Dynamics at the Stadthall, Gottingen, West Germany. This Symposium was organized by an international program committee chaired by Dr K. J. Orlik-Ruckemann of the Fluid Dynamics Panel. The program consisted of five sessions grouped in two parts: (1) Fundamentals of Unsteady Aerodynamics; and (2) Applications to Aircraft Dynamics. The 35 papers presented at the 4 day meeting are published in AGARD CP 386 and listed in the Appendix. As the papers are already available and cover a very wide field, the evaluators have offered brief comments on every paper, followed by an overall evaluation of the meeting, together with some general conclusions and recommendations. **COMPUTATION OF 3-DIMENSIONAL VISCOUS TRANSONIC FLOWS USING THE LU-ADI FACTORED SCHEME**

K. FUJII and S. OBAYASHI Nov. 1985 20 p
(NAL-TR-889T; ISSN-0389-4010) Avail: NTIS HC A02/MF A01

The LU-ADI (lower/upper block diagonal - alternating direction implicit) factored scheme was successfully applied to solve the three-dimensional compressible thin layer Navier-Stokes equations. The computations are carried out for the slightly supersonic flow over a hemispheric cylinder at high incidence and for the transonic flow over a swept wing. To simulate these complicated flow fields, fine grid distributions of up to about 200,000 points were used on the Japanese supercomputer of 1 GFLOPS. The total cpu time for each case was less than two hours. The results for the flow over a hemispheric cylinder at high incidence revealed the existence of the shock wave and the detailed structure of the vortical flow field on the leeward side. The result for the flow over the swept wing shows that the three-dimensional shock induced separation is well captured. These results indicate the capability of the present code to make three-dimensional complicated flow field simulations; and the application of the present code to the more practical flow fields such as transonic flows over the wing or the wing-body combination of the transportation aircraft is very promising. Even simulation over the whole aircraft may soon be possible. Author

**WIND TUNNEL TEST AND ANALYSIS ON GUST LOAD ALLEVIATION OF A HIGH-ASPECT-RATIO WING**
Nov. 1985 60 p In JAPANESE; ENGLISH summary
(NAL-TR-890; ISSN-0389-4010) Avail: NTIS HC A04/MF A01

Application of the active control technology to gust load alleviation problems was investigated both experimentally and analytically. Wind tunnel test were conducted for a high aspect ratio wing that assumes an energy efficient type of future transport. For these tests, National Aerospace Laboratory's low speed wind tunnel was equipped with a gust generator with hydraulic servo system. This generator generates turbulence by utilizing the tip vortices from the cantilevered double wings. Atmospheric turbulence was simulated in the tunnel according to the Dryden mathematical model. Control surfaces of the flexible wing model were actuated by a small dc electric motor embedded in the airfoil. A handy analog computer played the role of controller to drive control surfaces by the signals from two accelerometers and a strain gauge which was installed in the model as feedback sensors. Control laws were obtained by the optimal control theory with its performance index selected as the total energy of the system. Simple control laws based on the LQG theory demonstrated their effectiveness against realistic random gusts. At the end of the test, the flutter boundary of this model was determined for the configuration without active control. Author

**AIRCRAFT DRAG PREDICTION AND REDUCTION. ADDENDUM 1: COMPUTATIONAL DRAG ANALYSES AND MINIMIZATION; MISSION IMPOSSIBLE?**
J. W. SLOOFF (National Aerospace Lab., Amsterdam, Netherlands) Apr. 1986 33 p Presented at Aircraft Drag Prediction and Reduction, Rhode Saint Genese, Belgium, 20-23 May 1985, and Hampton, Va., 5-8 Aug. 1985; sponsored by the von Karman Inst., AGARD, and NASA Langley Research Center
(AGARD-R-723-ADD-1; ISBN-92-835-1524-2) Avail: NTIS HC A03/MF A01

The Special Course on Aircraft Drag Prediction was sponsored by the AGARD Fluid Dynamics Panel and the von Karman Institute and presented at the von Karman Institute, Rhode-Saint-Genese, Belgium, on 20 to 23 May 1985 and at the NASA Langley Research Center, Hampton, Virginia, USA, 5 to 6 August 1985. The course began with a general review of drag reduction technology. Then the possibility of reduction of skin friction through control of laminar flow and through modification of the structure of the turbulence in the boundary layer were discussed. Methods for predicting and reducing the drag of external stores, of nacelles, of fuselage protuberances, and of fuselage afterbodies were then presented followed by discussion of transonic drag rise. The prediction of viscous and wave drag by a method matching inviscid flow calculations and boundary layer integral calculations, and the reduction of transonic drag through boundary layer control are also discussed. This volume comprises Paper No.9 Computational Drag Analyses and Minimization: Mission Impossible? which was not included in AGARD Report 723 (main volume). Author

Avail: NTIS HC A18/MF A01 CSCL 01A

Some background information is provided for the Vortex Flow Aerodynamics Conference and that current slender wing airplanes do not use variable leading edge geometry to improve transonic drag polar is shown. Highlights of some of the initial studies combining wing camber, or flaps, with vortex flow are presented. Current vortex flap studies were reviewed to show that there is a large subsonic data base and that transonic and supersonic generic studies have begun. There is a need for validated flow field solvers to calculate vortex/shock interactions at transonic and supersonic speeds. Many important research opportunities exist for fundamental vortex flow investigations and for designing advanced fighter concepts. Author

**EXTENSIONS OF THE CONCEPT OF SUCTION ANALOGY TO PREDICTION OF VORTEX LIFT EFFECT**
C. E. LAN *In* NASA. Langley Research Center Vortex Flow Aerodynamics, Vol. 1 p 65-84 Jul. 1986
(Contract NSG-1629)
Avail: NTIS HC A18/MF A01 CSCL 01A

Flow field data for a double delta wing at low speed were used to determine the location of a vortex action point. The result was found to be consistent with what was determined for a delta wing. In supersonic flow, the action point location was determined empirically. For a wing with rounded leading edges, an assumption for initial vortex separation was shown to be equivalent to initial leading edge bubble separation for airfoils. A theoretical formulation by the section analogy to determine the delayed vortex separation on a cambered wing with rounded leading edges was presented. The method of suction analogy was further shown to be applicable to predicting the body vortex lift. Author

**A DIRECT AND INVERSE BOUNDARY LAYER METHOD FOR SUBSONIC FLOW OVER DELTA WINGS**

S. H. WOODSON and F. R. DEJARNETTE *In* NASA. Langley Research Center Vortex Flow Aerodynamics, Vol. 1 p 115-133 Jul. 1986
(Contract NCC1-22)
Avail: NTIS HC A18/MF A01 CSCL 01A

A new inverse boundary layer method is developed and applied to incompressible flows with laminar separation and reattachment. Test cases for two dimensional flows are computed and the results are compared with those of other inverse methods. One advantage of the present method is that the calculation of the inviscid velocities may be determined at each marching step without having to iterate. The inverse method was incorporated with the direct method to calculate the incompressible, conical flow over a slender delta wing at incidence. The location of the secondary separation line on the leeward surface of the wing is determined and compared with experiment for a unit aspect ratio wing at 20.5 deg incidence. The viscous flow in the separated region was calculated using prescribed skin friction coefficients. Author

**AN EXPERIMENTAL INVESTIGATION OF VORTEX BREAKDOWN ON A DELTA WING**

F. M. PAYNE and R. C. NELSON *In* NASA. Langley Research Center Vortex Flow Aerodynamics, Vol. 1 p 135-161 Jul. 1986
(Contract NAG2-258)
Avail: NTIS HC A18/MF A01 CSCL 01A

An experimental investigation of vortex breakdown on delta wings at high angles is presented. Thin delta wings having sweep angles of 70, 75, 80 and 85 degrees are being studied. Smoke flow visualization and the laser light sheet technique are being used to obtain cross-sectional views of the leading edge vortices as they break down. At low tunnel speeds (as low as 3 m/s) details of the flow, which are usually imperceptible or blurred at higher speeds, can be clearly seen. A combination of lateral and longitudinal cross-sectional views provides information on the three dimensional nature of the vortex structure before, during and after breakdown. Whereas details of the flow are identified in still photographs, the dynamic characteristics of the breakdown process were recorded using high speed movies. Velocity measurements were obtained using a laser Doppler anemometer with the 70 degree delta wing at 30 degrees angle of attack. The measurements show that when breakdown occurs the core flow transforms from a jet-like flow to a wake-like flow. Author

**LASER VELOCIMETRY IN HIGHLY THREE-DIMENSIONAL AND VORTICAL FLOWS**

C. J. NOVAK, C. R. HUIE, and K. C. CORNELIUS *In* NASA. Langley Research Center Vortex Flow Aerodynamics, Vol. 1 p 163-185 Jul. 1986
Avail: NTIS HC A18/MF A01 CSCL 01A

The need for experimentally determined 3-D velocity information is crucial to the understanding of highly 3-dimensional and vortical flow fields. In addition to gaining an understanding of the physics of flow fields, a correlation of velocity data is needed for advanced computational modelling. A double pass method for acquiring 3-D flow field information using a 2-D laser velocimeter (LV) is described. The design and implementation of a 3-D LV with expanded capabilities to acquire real-time 3-D flow field information are also described. Finally, the use of such an instrument in a wind tunnel study of a generic fighter configuration is described. The results of the wind tunnel study highlight the complexities of 3-D flow fields, particularly when the vortex behavior is examined over a range of angles of attack. Author

**IN-FLIGHT AND WIND TUNNEL LEADING-EDGE VORTEX STUDY ON THE F-106B AIRPLANE**

J. E. LAMAR *In its* Vortex Flow Aerodynamics, Vol. 1 p 187-201 Jul. 1986
Avail: NTIS HC A18/MF A01 CSCL 01A

The vapor screen technique was successfully applied to an F-106B fighter aircraft during subsonic and transonic maneuvers. This system has allowed the viewing of multiple vortex systems on the wing upper surface at angles of attack less than 19 deg. In addition, similarities as well as differences were determined to exist between the vortex systems for a full scale semispan model and the flight vehicle at 20 deg incidence. Furthermore, variations in Reynolds number and Mach number were identified as to how they affect vortex system details at flight conditions. Author

**BASIC STUDIES ON DELTA WING FLOW MODIFICATIONS BY MEANS OF APEX FENCES**

K. D. HOFFLER, D. M. RAO, and M. C. FRASSINELLI (Air Force Wright Aeronautical Labs., Wright-Patterson AFB, Ohio) *In* NASA. Langley Research Center Vortex Flow Aerodynamics, Vol. 1 p 203-217 Jul. 1986
Avail: NTIS HC A18/MF A01 CSCL 01A

The effectiveness of apex fences on a 60-deg delta wing at low speeds was experimentally investigated. Resembling highly swept spoilers in appearance, the fences are designed to fold out of the wing apex region upper surface near the leading edges, where they generate a powerful vortex pair. The intense suction of the fence vortices augments lift in the apex region, the resulting positive pitching moment being utilized to trim trailing edge flaps for lift augmentation during approach and landing at relatively low angles of attack. The fences reduce the apex lift at high angles of attack, leading to a desirable nose-down moment. The above projected functions of the apex fence device were validated and quantified through low speed tunnel tests, comprising upper surface pressure surveys on a semispan model and balance measurements on a geometrically similar fully span wing/body configuration. Fence parameters such as area, shape, hinge position and deflection angle were investigated. Typical results are presented indicating the apex fence potential in controlling the longitudinal characteristics of a tail-less delta. Author

**TOWARDS AN ADVANCED VORTEX FLAP SYSTEM: THE CAVITY FLAP**

D. M. RAO *In* NASA. Langley Research Center Vortex Flow Aerodynamics, Vol. 1 p 219-230 Jul. 1986
Avail: NTIS HC A18/MF A01 CSCL 01A

An extension of the vortex flap concept was explored with the aim of providing high-alpha flight control capability coupled with maneuver drag reduction for highly swept wing configurations. A retractable lower surface flap mounted on a translating hinge is proposed, allowing chordwise extension as well as deflection, the two movements being independently controlled. The frontal cavity formed by the partially extended and deflected flap captures a vortex above a certain angle of attack. The cavity vortex downwash alleviates the effective incidence of the wing leading edge, thus modulating vortex lift; at the same time, the induced suction in the cavity generates thrust. These postulated aerodynamic features of the cavity flap were validated through low speed tunnel pressure and visualization tests on a 65 deg swept oblique wing model, which also provided initial trends of the leading edge vortex alleviation and cavity suction with respect to flap extension, deflection and angle of attack. Force tests on a 60 deg delta model further showed the cavity flap L/D performance to compare favorably with the conventional vortex flap. A two segment flap arrangement with independently control led segments was envisaged for exploiting the vortex modulation capability of the cavity flap for pitch, roll and yaw control, in addition to drag reduction at high angles of attack. **VORTEX FLOW HYSTERESIS**
A. M. CUNNINGHAM, JR. *In* NASA. Langley Research Center Vortex Flow Aerodynamics, Vol. 1 p 231-248 Jul. 1986
Avail: NTIS HC A18/MF A01 CSCL 01A

An experimental study was conducted to quantify the hysteresis associated with various vortex flow transition points and to determine the effect of planform geometry. The transition points observed consisted of the appearance (or disappearance) of trailing edge vortex burst and the transition to (or from) flat plate or totally separated flows. Flow visualization with smoke injected into the vortices was used to identify the transitions on a series of semi-span models tested in a low speed tunnel. The planforms tested included simple deltas (55 deg to 80 deg sweep), cranked wings with varying tip panel sweep and dihedral, and a straked wing. High speed movies at 1000 frames per second were made of the vortex flow visualization in order to better understand the dynamics of vortex flow, burst and transition. Author

Avail: NTIS HC A18/MF A01 CSCL 01A

The current capabilities and the future plans for a three dimensional Euler Aerodynamic Method are described. The basic solution algorithm is based on the finite volume, Runge-Kutta pseudo-time-stepping scheme of FLO-57. Several modifications to improve accuracy and computational efficiency were incorporated and others are being investigated. The computer code is used to analyze a cropped delta wing at 0.6 Mach number and an arrow wing at 0.85 Mach number. Computed aerodynamic parameters are compared with experimental data. In all cases, the configuration is impulsively started and no Kutta condition is applied at sharp edges. The results indicate that with additional development and validation, the present method will be a useful tool for engineering analysis of high speed aircraft. Author

Avail: NTIS HC A18/MF A01 CSCL 01A

The simulation of the leading edge vortex flow about a series of conical delta wings through solution of the Navier-Stokes and Euler equations is studied. The occurrence, the validity, and the usefulness of separated flow solutions to the Euler equations of particular interest. Central and upwind difference solutions to the governing equations are compared for a series of cross sectional shapes, including both rounded and sharp tip geometries. For the rounded leading edge and the flight condition considered, viscous solutions obtained with either central or upwind difference methods predict the classic structure of vortical flow over a highly swept delta wing. Predicted features include the primary vortex due to leading edge separation and the secondary vortex due to crossflow separation. Central difference solutions to the Euler equations show a marked sensitivity to grid refinement. On a coarse grid, the flow separates due to numerical error and a primary vortex which resembles that of the viscous solution is predicted. In contrast, the upwind difference solutions to the Euler equations predict attached flow even for first-order solutions on coarse grids. On a sufficiently fine grid, both methods agree closely and correctly predict a shock-curvature-induced inviscid separation near the leeward plane of symmetry. Upwind difference solutions to the Navier-Stokes and Euler equations are presented for two sharp leading edge geometries. The viscous solutions are quite similar to the rounded leading edge results with vortices of similar shape and size. The upwind Euler solutions predict attached flow with no separation for both geometries. However, with sufficient grid refinement near the tip or through the use of more accurate spatial differencing, leading edge separation results. Once the leading edge separation is established, the upwind solution agrees with recently published central difference solutions to the Euler equations. Author

**STEADY SUPERSONIC NAVIER-STOKES SOLUTIONS OF A 75 DEG DELTA WING**
T. A. BUTER and D. P. RIZZETTA *In* NASA. Langley Research Center Vortex Flow Aerodynamics, Vol. 1 p 331-347 Jul. 1986
Avail: NTIS HC A18/MF A01 CSCL 01A

Steady solutions about a slender sharp edged delta wing in a supersonic freestream for moderate and high angles of attack are obtained numerically by time integration of the unsteady compressible three dimensional laminar Navier-Stokes equations. The main features of the flow, including primary and secondary separation, and vortex position and strength, are adequately simulated in the numerical solutions. Improved resolution of the computational grid in the leading edge region from a previous solution had considerable effect on the accuracy of the solutions. Good agreement between numerical solutions and experimental data was obtained for two cases. A local timestepping procedure is used to speed convergence by approximately a factor of two. Author

**WATER TUNNEL RESULTS OF LEADING-EDGE VORTEX FLAP TESTS ON A DELTA WING VEHICLE**
J. H. DELFRATE *In* NASA. Langley Research Center Vortex Flow Aerodynamics, Vol. 1 p 379-389 Jul. 1986
Avail: NTIS HC A18/MF A01 CSCL 01A

A water tunnel flow visualization test on leading edge vortex flaps was conducted at the flow visualization facility of the NASA Ames Research Center's Dryden Flight Research Facility. The

purpose of the test was to visually examine the vortex structures caused by various leading edge vortex flaps on the delta wing of an F-106 model. The vortex flaps tested were designed analytically and empirically at the NASA Langley Research Center. The three flap designs were designated as full-span gothic flap, full-span untapered flap, and part-span flap. The test was conducted at a Reynolds number of 76,000/m (25,000/ft). This low Reynolds number was used because of the 0.076-m/s (0.25-ft/s) test section flow speed necessary for high quality flow visualization. However, this low Reynolds number may have influenced the results. Of the three vortax flaps tested, the part-span flap produced what appeared to be the strongest vortex structure over the flap area. The full-span gothic flap provided the next best performance.

**EVALUATION OF 3 NUMERICAL METHODS FOR PROPULSION INTEGRATION STUDIES ON TRANSONIC TRANSPORT CONFIGURATIONS**

S. F. YAROS, J. R. CARLSON, and B. CHANDRASEKARAN (Vigyan Research Associates, Inc., Hampton, Va.) Jun. 1986 23 p Presented at the 4th AIAA Applied Aerodynamics Conference, San Diego, Calif., 9-11 Jun. 1986
(NASA-TM-87727; NAS 1.15:87727; AIAA-86-1814) Avail: NTIS HC A02/MF A01 CSCL 01A

An effort has been undertaken at the NASA Langley Research Center to assess the capabilities of available computational methods for use in propulsion integration design studies of transonic transport aircraft, particularly of pylon/nacelle combinations which exhibit essentially no interference drag. The three computer codes selected represent state-of-the-art computational methods for analyzing complex configurations at subsonic and transonic flight conditions. These are: EULER, a finitie volume solution of the Euler equation; VSAERO, a panel solution of the Laplace equation; and PPW, a finite difference solution of the small disturbance transonic equations. In general, all three codes have certain capabilities that allow them to be of some value in predicting the flows about transport configurations, but all have limitations. Until more accurate methods are available, careful application and interpretation of the results of these codes are needed. Author

**ANALYSIS OF WINGS WITH LEADING EDGE AND/OR TRAILING EDGE SEGMENTED (SPANWISE) FLAPS USING PLANAR HORSE SHOE VORTEX LATTICE METHOD**

B. RAJESWARI and H. N. V. DUTT Nov. 1985 74 p
(NAL-TM-AE-8507) Avail: NTIS HC A04/MF A01

A method and a computer program in FORTRAN have been developed for the analysis of wings with segmented leading edge and trailing edge flaps using planar horse-shoe vortices. This computer program can be used to estimate overall aerodynamic characteristics like C sub L, C sub D and C sub M and the detailed local loads for a given wing flap geometry at specified incidence and Mach number. The method has no limitations on aspect ratio, taper ratio and sweep angles. The code has been validated for a number of cases for which experimental data is available. The program is working on UNIVAC 1100-60 computer and takes about 2 minutes to analyze a typical wing-flap configuration (with approximately 120 panels) for a given incidence and Mach number. Author

**PRELIMINARY RESULTS OF UNSTEADY BLADE SURFACE PRESSURE MEASUREMENTS FOR THE SR-3 PROPELLER**

L. J. HEIDELBERG and B. J. CLARK 1986 26 p Presented at the 10th Aeroacoustics Conference, Seattle, Wash., 9-11 Jul. 1986
(NASA-TM-87352; E-3106; NAS 1.15:87352; AIAA-86-1893)
Avail: NTIS HC A03/MF A01 CSCL 01A

Unsteady blade surface pressures were measured on an advanced, highly swept propeller known as SR-3. These measurements were obtained because the unsteady aerodynamics of these highly loaded transonic blades is important to noise generation and aeroelastic response. Specifically, the response to periodic angle-of-attack change was measured for both two- and eight-bladed configurations over a range of flight Mach numbers from 0.4 to 0.85. The periodic angle-of-attack change was obtained by placing the propeller axis at angles up to 4 deg to the flow. Most of the results are presented in terms of the unsteady pressure coefficient variation with Mach number. Both cascade and Mach number effects were largest on the suction surface near the leading edge. The results of a three-dimensional Euler code applied in a quasi-steady fashion were compared to measured data at the reduced frequency of 0.1 and showed relatively poor agreement. Pressure waveforms are shown that suggest shock phenomena may play an important part in the unsteady pressure response at some blade locations. Author

Correlations obtained by ONERA researchers in studies of large amplitude oscillations in airfoils are discussed. The correlation values were generated with a dynamic model for helicopter rotor blades experiencing nonlinear oscillations in the lift/angle of attack or moment/angle of attack hysteresis loops. Comparisons were made between the model predictions and data from NASA experiments with NACA 0012 airfoils at varying angles of attack, amplitudes and frequencies. The model proved adequate for predicting the hysteresis loops and in identifying stall behavior.

The state of the art in predicting and modeling helicopter noise, its sources, components, magnitudes and dynamic characteristics, is assessed. Noise is not emitted by steady flow, and can be decomposed into noise and pseudo-noise. Account must be taken of pseudo-noise in considerations of passenger comfort. The evolution of vortices in the turbulent boundary layer, the turbulent wake and at the blade tips produces noise. The difficulty in predicting noise arises from the complex behavior of vortices, atmospheric processes which affect the noise during flight and interactions among noise effects of separate blades and the fuselage noise. Various experiments are suggested for deriving quantitative laws to improve noise prediction efforts.

**DYNAMIC STALL OF SWEPT AND UNSWEPT OSCILLATING WINGS**

F. O. CARTA *In* AGARD Unsteady Aerodynamics-Fundamentals and Applications to Aircraft Dynamics 15 p Nov. 1985
Avail: NTIS HC A99/MF A01

Recent unsteady tests on oscillating tunnel-spanning wings (representative of full scale helicopter blades) have shown that the dynamic stall phenomena for a swept wing model is significantly different from that for an unswept wing. Several critical measurements and calculations relative to the behavior of the surface flow were made, including chordwise wave speed of the stalling vortex, the degree of pitch rate dependence of the vortex inception angle, and the ability of the cosine law for sweep to normalize unsteady poststall behavior, even after reattachment occurs. Finally, an examination of hot-film response data shows that the stagnation flow along the swept wing leading edge significantly alters the unsteady surface flow behavior in a narrow region along the leading edge when compared with data from the unswept wing. However, from approximately 15 percent chord and aft there appears to be no sweep effect, and the results from both wings are nearly indistinguishable.

Avail: NTIS HC A99/MF A01

Detailed velocity and turbulence properties in the dynamically stalled boundary layer of an oscillating NACA 0012 airfoil were measured. The airfoil oscillated around an axis at 25% distance from the leading edge with a sinusoidal motion. Measurements are performed at eight chordwise positions, in non-stalled, stall onset, and deep stalled flow conditions. Instantaneous detailed flow and turbulence patterns of the periodic separation vortex are presented and discussed. Corresponding terms of the turbulent energy balance are derived and compared with flat plate boundary layer data. In particular, negative turbulent energy production is observed during vortex development.

Avail: NTIS HC A99/MF A01

The aerodynamic behavior of a wing profile subject to a flow of alternating potential and strong vortex is examined. The simulation experiment consisted of placing a fixed wing profile in the wake of a profile that oscillated at stalling incidence parallel to the flow. The results show that the effects on the fixed profile may be theoretically approximated by considering the profile as isolated in the flow while the amplitude of the speed and the incidence are simultaneously variable with the pre-established values.

**A CRITICAL LOOK AT DYNAMIC SIMULATION OF VISCOUS FLOW**

L. E. ERICSSON *In* AGARD Unsteady Aerodynamics-Fundamentals and Applications to Aircraft Dynamics
11 p Nov. 1985
Avail: NTIS HC A99/MF A01

A critical examination is made of the classic role of the wind tunnel as a tool for simulation of the free flight aerodynamics. That the equivalence concept established for steady flow is not valid for unsteady flow is no great surprise. More surprising, probably, is the fact that simulation of the relative velocity time history, which assures simulation of the inviscid unsteady aerodynamics, will in many cases not assure simulation of the unsteady viscous flow. In the case of flow separation and associated hysteresis the lack of simulation of the transient viscous flow can sometimes even generate the incorrect final steady state flow condition. Only close attention to the simulation of the unsteady boundary condition at the vehicle surface can assure the utility of experimental and numerical results for prediction of full scale unsteady viscous flow characteristics.

W. GEISSLER *In* AGARD Unsteady Aerodynamics-Fundamentals and Applications to Aircraft Dynamics 12 p Nov. 1985
Avail: NTIS HC A99/MF A01

Experimental investigations have exposed a strong dependency of unsteady separation characteristics in the regime of dynamic stall on airfoil shape, Reynolds and Mach number, and frequency and time dependence incidence. A suitable prediction method should be able to account for these various parameters. Coupling procedures between two-dimensional unsteady boundary layers and inviscid surface singularity methods (panel methods) were developed for analytical investigation of unsteady turbulent separation. The influence of various parameters on unsteady separation is discussed in detail and comparison with experimental data is made. The results show that, even for weak coupling between boundary layer and inviscid boundary condition, good correspondence exists between theory and experiment with respect to the development of unsteady separation. (Contract F496720-82-C-0055)
Avail: NTIS HC A99/MF A01 CSCL 01A

The calculation of unsteady flows and the development of numerical methods for solving unsteady boundary layer equations and their application to the flows around important configurations such as oscillating airfoils are presented. A brief review of recent work is provided with emphasis on the need for numerical methods which can overcome possible problems associated with flow reversal and separation. The zig-zag and characteristic box schemes are described in this context, and when embodied in a method which permits interaction between solutions of inviscid and viscous equations, the characteristic box scheme is shown to avoid the singularity associated with boundary layer equations and prescribed pressure gradient. Calculations were performed for a cylinder started impulsively from rest and oscillating airfoils. The results are presented and discussed. It is conlcuded that turbulence models based on an algebraic specification of eddy viscosity can be adequate, that location of translation is important to the calculation of the location of flow separation and, therefore, to the overall lift of an oscillating airfoil. Avail: NTIS HC A99/MF A01 CSCL 01A

The flow over the B-1 wing is studied computationally, including the aeroelastic response of the wing. Computed results are compared with results from wind tunnel and flight tests for both low-sweep and high-sweep cases, at 25.0 and 67.5 deg., respectively, for selected transonic Mach numbers. The aerodynamic and aeroelastic computations are made by using the transonic unsteady code ATRAN3S. Steady aerodynamic computations compare well with wind tunnel results for the 25.0 deg sweep case and also for small angles of attack at the 67.5 deg sweep case. The aeroelastic response results show that the wing is stable at the low sweep angle for the calculation at the Mach number at which there is a shock wave. In the higher sweep case, for the higher angle of attack at which oscillations were observed in the flight and wind tunnel tests, the calculations do not show any shock waves. Their absence lends support to the hypothesis that the observed oscillations are due to the presence of leading edge separation vortices and are not due to shock wave motion as was previously proposed. G. E. A. MEIER and R. TIMM *In* AGARD Unsteady Aerodynamics-Fundamentals and Applications to Aircraft Dynamics 10 p Nov. 1985

Avail: NTIS HC A99/MF A01

The unsteady flow in the vicinity of an airfoil in a subsonic flow with strong vortices is investigated for a two-dimensional problem. Emphasis was placed on the interaction of the passing vortex flow field with the steady flow field of the airfoil. Unsteady flow separation and generation of new vortices of the airfoil occurs depending on vortex strength and core path. Inviscid calculations of vortex paths and sound generation are compared with the experimental results. The associated pressure waves have a strong directivity. The vortices used for the interaction experiments are generated by different vortex shedding cylinders in a stationary duct flow or by airfoils in the starting flow of a shock-tube. High speed interferometric flow recording and wall pressure measurement are the main experimental techniques. Author

T. S. BEDDOES *In* AGARD Unsteady Aerodynamics-Fundamentals and Applications to Aircraft Dynamics 10 p Nov. 1985

Avail: NTIS HC A99/MF A01

The feasibility of producing aerodynamic loads of sufficient fidelity to enable a realistic acoustic signal to be derived was studied. The need arises from the excessive blade/slap noise which results from blade/vortex interaction. A tool is required to investigate the influence of design and operational parameters as a routine procedure. For this purpose a simplified two dimensional model was developed and validated against a more sophisticated analysis. The model is extended to the rotor application where the complex wake geometry is the determining factor in the character of the loading. From the distributed transient loading an acoustic signal was derived which was compared with experimental data. A comprehensive correlation was not yet performed but the preliminary results are encouraging. Author

Avail: NTIS HC A99/MF A01 CSCL 01A

Two rotary balance apparatuses were developed for testing airplane models in a coning motion. A large scale apparatus, developed for use in the 12-foot Pressure Wind Tunnel primarily to permit testing at high Reynolds numbers, was recently used to investigate the aerodynamics of 0.05-scale model of the F-15 fighter aircraft. Effects of Reynolds number, spin rate parameter, model attitude, presence of a nose boom, and model/sting mounting angle were investigated. A smaller apparatus, which investigates the aerodynamics of bodies of revolution in a coning motion, was used in the 6-by-6 foot Supersonic Wind Tunnel to investigate the aerodynamic behavior of a simple representation of a modern fighter, the Standard Dynamic Model (SDM). Effects of spin rate parameter and model attitude were investigated. A description of the two rigs and a discussion of some of the results obtained in the respective tests are presented. Author

E. SCHMIDT *In* AGARD Unsteady Aerodynamics-Fundamentals and Applications to Aircraft Dynamics 16 p Nov. 1985

Avail: NTIS HC A99/MF A01

A slender high-load forced-oscillation measuring system for dynamic derivatives of aircraft and missile models in a transonic wind tunnel is presented together with typical test results of the significant aerodynamic coefficients and stability derivatives of the Standard Dynamics Model, a simplified fighter aircraft model with a wing span of 0.345 m. The measurements in the rotational modes pitch, yaw, and roll encompass Mach numbers from 0.6 to 1.2, angles of attack from 0 to 30 degrees, and excitation frequencies from 2 to 20 Hz at a constant Reynolds number of 7.8 Mio/m. Most of the stiffness and damping derivatives gathered show substantial nonlinear dependence on Mach number and angle of attack, whereas the influence of reduced frequency is less prominent. The results are closely related to published measurements on Standard Dynamic Models performed in other NATO countries. Author

D. TRISTRANT and O. RENIER *In* AGARD Unsteady Aerodynamics-Fundamentals and Applications to Aircraft Dynamics 14 p Nov. 1985 In FRENCH

Avail: NTIS HC A99/MF A01

In the aircraft dynamic behavior prediction context, experimental methods and analytical procedures which allow mathematical linear modeling parameters to be identified, using a test apparatus located at the Institut de Mecanique des Fluides de Lille is presented. The rig characteristics, the experimental procedures, the identification methods, and results from different aircraft models will be described. Emphasis is put on the interest of a specifc lambda degree of freedom angle formed by the rotational vector and velocity vector. Effectively, it is shown that rotational tests with a non zero value of lambda offer interesting possibilities for identification and allow the estimation of linear model parameters in the case of a quasi-linear path. A different degree of freedom, called gyration radius, was obtained by fixing a special mechanism onto the test apparatus. By carrying out a carefully selected test program, this degree of freedom allows the whole set of stability parameters to be identified, given the structure of the linear mathematical model. Finally, dynamic measures obtained during oscillatory coning using a complete aircraft model produced in evidence the large amplitude of unsteady aerodynamic phenomena at high angles of attack, which could not be ignored if prediction of post stall evolutions is sought. ### GENERATION OF TWO-DIMENSIONAL GUST FIELDS IN SUBSONIC WIND-TUNNELS

B. KRAG and W. WEGNER (Technische Univ., Brunswick, West Germany) *In* AGARD Unsteady Aerodynamics-Fundamentals and Applications to Aircraft Dynamics 12 p Nov. 1985
Avail: NTIS HC A99/MF A01

For a variety of flight vehicles, problems during flight in turbulence at subsonic speeds are expected: mainly slow flying helicopters, tilt rotorcraft, aircraft maneuvering at high angles of attack, wing in ground effect vehicles, and aircraft with active controlled wings. The investigation of these problems posses large difficulties. The analyst rapidly enters domains where computational methods fail and where wind tunnel experiments are necessary. This raises the problem of stimulating atmospheric turbulence in a wind tunnel. Until now, no fundamental investigations of the problem of gust generation in wind tunnels were undertaken. Investigations of gust generations were started in a model subsonic wind tunnel. In order to recognize the influence of the main parameters, like number of lift generating wings, chord length, trailing edge-flap or jet-flap, constant chord wing or side-wall mounted winglets, four different types of gust generators were investigated. The gust field was harmonically oscillating. Frequency response measurements of the gust angle of attack were made, covering the complete volume of the test section. Additionally the flow field in the wind tunnel behind harmonically oscillating gust generator flaps was calculated. The results were compared with the measurements. Author

### EXTRACTION OF AERODYNAMIC PARAMETERS FOR AIRCRAFT AT EXTREME FLIGHT CONDITIONS

K. W. ILIFF *In* AGARD Unsteady Aerodynamics-Fundamentals and Applications to Aircraft Dynamics 21 p Nov. 1985
Avail: NTIS HC A99/MF A01 CSCL 01A

The maximum likelihood estimator was used to extract stability and control derivatives from flight data for many years. Most of the literature on aircraft estimation concentrates on new development and applications, assuming familiarity with basic concepts. The maximum likelihood estimator and the aircraft equations of motion that the estimator uses are discussed. The current strength and limitations associated with obtaining flight-determined aerodynamic coefficients in extreme flight conditions are assessed. The importance of the careful combining of wind tunnel results (or calculations) and flight results and the thorough evaluation of the mathematical model is emphasized. The basic concepts of minimization and estimation are examined for a simple computed aircraft example, and the cost functions that are to be minimized during estimation are defined and discussed. Graphic representations of the cost functions are given to help illustrate the minimization process. Finally, the basic concepts are generalized, and estimation of stability and control derivatives from flight data is discussed. Author

### NONLINEAR PROBLEMS IN FLIGHT DYNAMICS INVOLVING AERODYNAMIC BIFURCATIONS

M. TOBAK and G. T. CHAPMAN *In* AGARD Unsteady Aerodynamics-Fundamentals and Applications to Aircraft Dynamics 15 p Nov. 1985 Previously announced as N85-25206
Avail: NTIS HC A99/MF A01 CSCL 01A

Aerodynamic bifurcation is defined as the replacement of an unstable equilibrium flow by a new stable equilibrium flow at a critical value of a parameter. A mathematical model of the aerodynamic contribution to the aircraft's equations of motion is amended to accommodate aerodynamic bifurcations. Important bifurcations such as, the onset of large-scale vortex shedding are defined. The amended mathematical model is capable of incorporating various forms of aerodynamic responses, including those associated with dynamic stall of airfoils. E.A.K.

### BIFURCATION THEORY APPLIED TO AIRCRAFT MOTIONS

W. H. HUI (Waterloo Univ., Ontario) and M. TOBAK *In* AGARD Unsteady Aerodynamics-Fundamentals and Applications to Aircraft Dynamics 14 p Nov. 1985 Previously announced as N85-23705
Avail: NTIS HC A99/MF A01 CSCL 01A

The bifurcation theory is used to analyze the nonlinear dynamic stability characteristics of single-degree-of-freedom motions of an aircraft or a flap about a trim position. The bifurcation theory analysis reveals that when the bifurcation parameter, e.g., the angle of attack, is increased beyond a critical value at which the aerodynamic damping vanishes, a new solution representing finite-amplitude periodic motion bifurcates from the previously stable steady motion. The sign of a simple criterion, cast in terms of aerodynamic properties, determines whether the bifurcating solution is stable (supercritical) or unstable (critical). For the pitching motion of a flap-plate airfoil flying at supersonic/hypersonic speed, and for oscillation of a flap at transonic speed, the bifurcation is subcritical, implying either that exchanges of stability between steady and periodic motion are accompanied by hysteresis phenomena, or that potentially large aperiodic departures from steady motion may develop. On the other hand, for the rolling oscillation of a slender delta wing in subsonic flight (wing rock), the bifurcation is found to be supercritical. This and the predicted amplitude of the bifurcation periodic motion are in good agreement with the experiments. Author

### DYNAMIC NONLINEAR AIRLOADS: REPRESENTATION AND MEASUREMENT

E. S. HANFF *In* AGARD Unsteady Aerodynamics-Fundamentals and Applications to Aircraft Dynamics 14 p Nov. 1985
Avail: NTIS HC A99/MF A01

A new representation of aerodynamic reactions (in terms of the motion variables), which does not rely on assumptions of linearity, is proposed. This representation is, therefore, indicated for extreme flight conditions where a locally linearized model is usually of questionable value. The significance within the present context of stability derivatives is discussed with the intention of pointing out their range of applicability. A wind tunnel technique, capable of efficiently obtaining the bulk of the data required for the effective use of the representation is briefly described. Author

J. D. LANG and M. S. FRANCIS (Air Force Space Div., Los Angeles, Calif.) *In* AGARD Unsteady Aerodynamics-Fundamentals and Applications to Aircraft Dynamics 19 p Nov. 1985
Avail: NTIS HC A99/MF A01

A forecast of future aerial combat predicated on anticipated technological advances and weapons developments suggests a need for supermaneuverable aircraft possessing greatly enhanced turning and virtually instantaneous point-and-shoot capabilities. The potential advantage of exploiting this unique flight environment was discussed along with a detailed description of expected vehicle dynamic behavior. An emerging picture of the unsteady aerodynamic behavior which will be experienced during these violent maneuvers dictates a need for greater vehicle and flow field control capabilities far in excess of any previously employed in application. However, the successful implementation of advanced control techniques may well beneficially exploit the unusual flow phenomena associated with this nonclassical method of flight. The research discoveries and developmental ideas generated during the next decade will likely alter the concept of maneuvering flight as it is known and lead to a new generation of aircraft with vastly improved combat capabilities. Avail: NTIS HC A99/MF A01

The problems of interfacing the mathematical representation of linearized unsteady aerodynamics with dynamic response such that the eigenvalue of the dynamic response are correctly obtained. These eigenvalues are then used in control synthesis. Particular attention is paid to C sub M2 (lag effect between the main wing and tail) in the context of aircraft dynamics. The concept of quasi-steady aerodynamics is clarified. Author

Avail: NTIS HC A99/MF A01

The mathematical model of aerodynamic forces and moments is described, based on results from various wind tunnel experiments with the Royal Airforce Establishment High Incidence Research Model (HIRM). Simulations of the responses due to longitudinal and lateral control inputs at high angles of attack are compared with the responses measured on free-flight models of the configuration. The main features of the flight behavior are reproduced, in particular such phenomena as roll-off, wing rock, and nose slice. Author

**THEORETICAL PREDICTION OF WING ROCKING**
C. E. LAN *In* AGARD Unsteady Aerodynamics-Fundamentals and Applications to Aircraft Dynamics 13 p Nov. 1985
Avail: NTIS HC A99/MF A01

Wing rock is primarily a rolling oscillation about the longitudinal body axis at high angles of attack. It involves nonlinear interaction between flight dynamics and aerodynamics. A nonlinear aerodynamic model was proposed earlier to predict the wing rock frequency and amplitude of low aspect-ratio configurations with good accuracy. The theory is applied to a twin-jet fighter aircraft of moderate aspect ratio and to a low-speed configuration of high aspect ratio. For the purpose of predicting necessary aerodynamic derivatives, a lifting surface method coupled with nonlinear airfoil section data is developed. The results show that wing rock can be predicted with the present wing-rock and aerodynamic theories. It is also found that for configurations of high aspect ratio, the one degree of freedom dynamic model in the present wing rock theory should be used. For other configurations, the three degrees of freedom model is more appropriate. Author

Avail: NTIS HC A99/MF A01

Results of a theoretical study on the effects of unsteady aerodynamics on symmetric aircraft responses due to elevator and vertical turbulence imputs, are presented. Several linear models were developed to describe unsteady lift and downwash and delays due to horizontal tail length. Results for three example aircraft types show that calculated normal acceleration levels due to turbulence are very little affected by including unsteady wing lift and downwash. However, there appears to be a noticeable influence on plunging acceleration and pitch rate response to elevator or vertical turbulence inputs. Author

**A SELF-ORGANISING CONTROL SYSTEM FOR NON-LINEAR AIRCRAFT DYNAMICS**
C. EVANS *In* AGARD Unsteady Aerodynamics-Fundamentals and Applications to Aircraft Dynamics 12 p Nov. 1985
Avail: NTIS HC A99/MF A01

At high angles of attack (AOA) flow separations can produce nonlinear and time varying aerodynamic loads, which cannot be predicted with great certainty. Such loads make control system development extremely difficult. A control system was developed which can accomplish on-line reduction of the a priori uncertainties pertaining to the effective control of the aircraft. The self-organizing control system was developed to suppress unacceptable pitch-up tendencies of an aircraft at high AOA, without the use of AOA measurement. The final control system demonstrated good performance for a variety of inputs although performance was not as good in turbulence. Author

Avail: NTIS HC A99/MF A01

Unsteady interactions of strong concentrated vortices, distributed gusts, and sharp-edged gusts with stationary airfoils were analyzed in two-dimensional transonic flow. A simple and efficient method for introducing such vortical disturbances was implemented in numerical codes that range from inviscid, transonic small-disturbance to thin-layer Navier Stokes. The numerical results demonstrate the large distortions in the overall flow field and in the surface air loads that are produced by various vortical interactions. The results of the different codes are in excellent qualitative agreement, but, as might be expected, the transonic small-disturbance calculations are deficient in the important region near the leading edge. **MODELLING OF THE VORTEX-AIRFOIL INTERACTION**

A. G. PANARAS *In* AGARD Unsteady Aerodynamics-Fundamentals and Applications to Aircraft Dynamics 16 p Nov. 1985

Avail: NTIS HC A99/MF A01

A modeling of the vortex-airfoil interaction is presented in which the finite-area of the real vortices is taken into consideration. Two vortex models are used. In the first, a disturbed piece of vorticity layer is simulated by four rows of discrete vortices of small strength. In the second, a number of discrete vortices is arranged within a circle. The first model may simulate a shear layer or a wake, while the second, a well-formed vortex. The method was applied to the calculation of the pressure induced on the surface of the airfoil by the interacting vortex. Both models give similar results. It was found that for large distances of the vortex from the surface of the airfoil, the consideration or not of the finite-area of the vortex is not a significant factor in determining the induced pressure field. However, when the distance of the vortex from the surface is reduced, its shape is distorted and the induced pressure pulses have lower amplitude than the ones induced by an equivalent point vortex. In the limit, where the vortex impinges on the leading edge of the airfoil, it is split into two and the time dependent pressure coefficient takes even negative values at some time intervals. Author

**IDENTIFICATION OF AIRCRAFT CHARACTERISTICS INCLUDING GUST INDUCED DYNAMIC EFFECTS**

D. ROHLF *In* AGARD Unsteady Aerodynamics-Fundamentals and Applications to Aircraft Dynamics 8 p Nov. 1985

Avail: NTIS HC A99/MF A01

For the investigation of unsteady aerodynamic effects at low Mach numbers, dynamic tests using controllable models of a light transport aircraft were performed in wind tunnels in the Dynamic Simulation Facility (Germany) and the Free Flight Catapult Facility (France). These model test techniques have the advantage of laboratory conditions with the possibility of generating reproducible qusts. The achieved flight test data were analyzed in detail applying method of system identification. This included the determination of the discrete gust disturbance from onboard measured signals. An approach was presented which used the measured angle of attack and additional calculated dynamic terms, which become essential in the presence of fast flow changes due to short-wave gusts or high-frequency control deflection. Measured time histories of model flight tests with excitation by control inputs and gusts are presented and compared with identification results obtained from the multi-run evaluation. Author

**EXPERIMENTAL STUDY OF THE EFFECT OF TURBULENCE ON DYNAMIC STALLING [ETUDE EXPERIMENTALE DE L'EFFET DE LA TURBULENCE SUR LE DECROCHAGE DYNAMIQUE]**

A. LANEVILLE, P. VITTECOQ, and J. COTE *In* AGARD Unsteady Aerodynamics-Fundamentals and Applications to Aircraft Dynamics 7 p Nov. 1985 In FRENCH

Avail: NTIS HC A99/MF A01

The results of a study of dynamic stalling for different intensities of turbulence in the flow of a wind tunnel are presented. The test was conducted on a NACA 0018 profile with sinusoidal oscillation. The results show that turbulence modifies both static and dynamic stall phenomena. It is shown that turbulence stabilizes the boundary layer at the leading edge, while allowing the profile to attain larger angles of incidence before stalling. In addition, turbulence alters the formation of vortices at the leading edge. Transl. by T. R.

**APPLICATION OF CFD TECHNIQUES TOWARD THE VALIDATION OF NONLINEAR AERODYNAMIC MODELS**

L. B. SCHIFF and J. KATZ *In* AGARD Unsteady Aerodynamics-Fundamentals and Applications to Aircraft Dynamics 15 p Nov. 1985 Previously announced as N85-26671

Avail: NTIS HC A99/MF A01 CSCL 14B

Applications of computational fluid dynamics (CFD) methods to determine the regimes of applicability of nonlinear models describing the unsteady aerodynamic responses to aircraft flight motions are described. The potential advantages of computational methods over experimental methods are discussed and the concepts underlying mathematical modeling are reviewed. The economic and conceptual advantages of the modeling procedure over coupled, simultaneous solutions of the gas dynamic equations and the vehicle's kinematic equations of motion are discussed. The modeling approach, when valid, eliminates the need for costly repetitive computation of flow field solutions. For the test cases considered, the aerodynamic modeling approach is shown to be valid. Author

**THE RISK TO THIRD PARTY PERSONNEL FROM RPV OPERATIONS**
V. COHEN (Theta Analysis and Systems, Ltd., Aldershot, England) IN: Remotely piloted vehicles; International Conference, 5th, Bristol, England, September 9-11, 1985, Proceedings . Bristol, England, University of Bristol, 1985, p. 3.1-3.7.

An evaluation is made of the risk that RPV battlefield operations present for ground personnel. Statistical material has been drawn from accident records for manned aircraft in the UK representing 11,600 accidents of relevant type, including 55 cases of third-party injury. Attention was given to possible correlations between injury rate and such variables as the aircraft wingspan and the weight/speed of aircraft. Considerable expense is projected for an RPV system complying with the required reliability levels. O.C.

**AN AVIATION COMPOSITE HAZARDS PRODUCT**
W. D. ZITTEL (NOAA, National Weather Service, Norman, OK) IN: International Conference on the Aviation Weather System, 2nd, Montreal, Canada, June 19-21, 1985, Preprints . Boston, MA, American Meteorological Society, 1985, p. 109-116. refs

The progress made by the Interim Operational Test Facility Staff between April and July 1984 in the founding of an aviation composite hazards product for the Next Generation Weather Radar (NEXRAD) is summarized. In designing this product, such hazards as heavy rain, gust fronts, turbulence, wind shear and tornadoes were considered injurious to aviation. Line contours were established for each hazard which were subsequently described functionally. The identity of each hazard was maintained and the contours were sufficiently grated to maintain time and space continuity. Hazards having areal extent were functionally described using harmonic analysis. Areas discussed in detail include NEXRAD algorithms, the mathematical methodology, display construction and future work. The results attest to the feasibility of functionally contouring hazards for use in an aviation composite hazards product. K.K.

**THE HAZARDS OF ASH CLOUDS TO CIVIL AIR TRANSPORT**
MR. REDDAN (Air France, Roissy, France) IN: International Conference on the Aviation Weather System, 2nd, Montreal, Canada, June 19-21, 1985, Preprints . Boston, MA, American Meteorological Society, 1985, p. 146, 147.

The hazard posed to commercial aviation by ash clouds from erupting volcanoes is discussed. The capability of cloud matter to cause engine failure, to erode windshields, leading edges, fan blades, aerials, and landing lights, and to choke filters and pipes is described. Radar and satellite methods of detecting ash clouds are addressed, and the importance of further measures is stressed, particularly the need for a network to gather and distribute information. C.D.

**A86-37478**
**METEOSAT-DERIVED QUANTITATIVE MEASUREMENTS ON VOLCANIC ASH PLUMES FOR WARNING TO AVIATION**
B. BIZZARRI, P. PAGANO, and M. PERRONE (Aeronautica Militare Italiana, Servizio Meteorologico, Rome, Italy) IN: International Conference on the Aviation Weather System, 2nd, Montreal, Canada, June 19-21, 1985, Preprints . Boston, MA, American Meteorological Society, 1985, p. 148-151. refs

The use of the Meteosat satellite to detect and evaluate plumes of volcanic ash which pose a danger to aviation is discussed. A Meteosat infrared image of a plume is shown and discussed, and the image is used to derive quantitative information on the plume's height, emissivity, optical thickness, eruption energy, ash mass, mass evolution and abatement, and vertical distribution and concentration. The verification of these analytical results and the evaluation of the risk posed by this plume are briefly discussed. A possible procedure for warning aircraft is considered. C.D.

**NASA STORM HAZARDS RESEARCH IN LIGHTNING STRIKES TO AIRCRAFT**
B. D. FISHER, P. W. BROWN (NASA, Langley Research Center, Hampton, VA), and J. A. PLUMER (Lightning Technologies, Inc., Pittsfield, MA) IN: International Conference on the Aviation Weather System, 2nd, Montreal, Canada, June 19-21, 1985, Preprints . Boston, MA, American Meteorological Society, 1985, p. 152-160. refs

The lightning strike condition data gathered in the 1980-1984 period are presented, together with the lightning attachment point analysis for the NASA F-106B research aircraft are presented. The analysis of the experienced 637 direct lightning strikes shows that the highest strike rates (2.1 strikes/min and 13 strikes/penetration) occurred at altitudes between 38,000 and 40,000 ft. The regions of highest risk for an aircraft to experience a direct lightning strike were the areas of thunderstorms where the ambient temperature was colder than -40 C and where the relative turbulence and precipitation intensities were characterized as negligible to light. The presence and location of lightning, therefore, did not necessarily indicate the presence and location of hazardous precipitation and turbulence. The total onboard data show that the lightning attachment patterns on this aircraft fall into four general categories, although the 1984 data suggest that the entire surface of the F-106B may be susceptible to lightning attachment. I.S.

**A86-37482**
**TERRAIN-INDUCED WIND SHEAR - POTENTIAL CAUSE OF JETSTAR ACCIDENT**
W. FROST (Tennessee, University, Tullahoma), J. MCCARTHY, P. HILDEBRAND (National Center for Atmospheric Research, Boulder, CO), and K. H. HUANG (FWG Associates, Inc., Tullahoma, TN) IN: International Conference on the Aviation Weather System, 2nd, Montreal, Canada, June 19-21, 1985, Preprints . Boston, MA, American Meteorological Society, 1985, p. 177-185. Research supported by the U.S. Department of Justice and NSF. refs

An investigation was made to ascertain the effects of terrain-induced wind shear on the Jetstar accident near Westchester County Airport, in White Plains, New York on February 11, 1981. A mathematical model of the quasi-steady winds experienced by the airplane was developed, with computer-simulated turbulence fluctuations superimposed. The approach path of the aircraft through these winds was computed using a six-degree-of-freedom, aircraft dynamics computer program. These models were collaborated by simulating the flow field in an atmospheric boundary layer simulation water tunnel. The mathematical model of the wind field exhibited excellent agreement with these water tunnel simulations, and it is concluded that the model presented is a realistic simulation of the wind shear effects that may have influenced the accident. Moreover, the results illustrate that terrain features along airport approach paths can produce augmented low-level turbulence together with hazardous wind shear. K. K.

**A86-37489**

### THE CRASH OF C-GTLA - THE CUMULATIVE EFFECTS OF SMALL DEFECTS AND A HINT OF A PREVIOUSLY UNRECOGNIZED MAJOR METEOROLOGICAL HAZARD

W. F. ZELTMANN (International Weather Corp., Brooklyn, NY) IN: International Conference on the Aviation Weather System, 2nd, Montreal, Canada, June 19-21, 1985, Preprints . Boston, MA, American Meteorological Society, 1985, p. 218, 219.

The November 1983 crash of the C-CGTLA aircraft in the vicinity of the Lansdowne House weather station in Northern Ontario is investigated. A severe winter storm was centered over Wisconsin and moving northward; heavy snow was falling in the vicinity of Lansdowne House on a steady flow of northeasterly winds off Hudson Bay and James Bay. The whiteout conditions experienced by the pilot may have been enhanced by a microburst within instability snow showers. It is noted that a combination of a microburst and a whiteout is extremely hazardous, and a serious effort must be made to determine how often these two phenomena occur together. It is suggested that past accident reports by canvassed to determine their mutual frequency, and that an airport on the shores of the Great Lakes be instrumented to obtain statistical data. K.K.

**A86-37490**

### LIGHTNING MEASUREMENTS OF AN AIRCRAFT FLYING AT LOW ALTITUDE

P. L. RUSTAN, JR. and J. L. HEBERT (USAF, Wright Aeronautical Laboratories, Wright-Patterson AFB, OH) IN: International Conference on the Aviation Weather System, 2nd, Montreal, Canada, June 19-21, 1985, Preprints . Boston, MA, American Meteorological Society, 1985, p. 220-225. refs

In a combined USAF/FAA inflight lightning-measurements program, an instrumented FAA CV-580 aircraft flew in and near active thunderstorms in Florida; data were collected on 21 direct lightning strikes to the aircraft. The primary purpose of this program was to characterize the lightning waveform so that the electromagnetic hazards to aircraft due to lightning strikes could be determined. Meteorological conditions conducive to lightning strikes were investigated, and these CV-580 statistics were compared to those obtained by other research aircraft as well as commercial and military aircraft. The CV-580 experienced 63 percent of its strikes at an altitude of 18,000 ft, at which point the aircraft was closer to the large negative charge center of the thunderstorm and more likely to trigger an intracloud discharge. The characteristics of this discharge are also a function of altitude. K.K.

**A86-37625**

### MICROCOMPUTERS AND AVIATION

P. GARRISON New York, Wiley Press, 1985, 279 p.

The different ways in which microcomputers can be useful to pilots and others involved in different phases of aviation are discussed. The Flight Simulator II software aviation package, which turns a microcomputer into a fully-equipped stationary single-engine aircraft which can take off, fly, and land is examined. A variety of commercially marketed software packages that can be used by pilots for flight planning and instrument training are described. A library of aviation programs is presented which can be keyed into a microcomputer to perform a variety of tasks, such as determining weight-and-balance conditions, finding takeoff distances under different wind, weather, and runway conditions and the determining the best cruising altitude based on winds aloft. C.D.

**A86-37940**

### PUTTING A PRICE ON SAFETY

R. ASHFORD (Civil Aviation Authority, London, England) Flight International (ISSN 0015-3710), vol. 129, April 19, 1986, p. 39-42.

The differences between the US Federal Airworthiness Regulations (FAR 25) and the European Joint Airworthiness Requirements (JAR 25) are elucidated, and the demands by aircraft manufacturing and operating industries for greater uniformity of international standards are investigated. It is proposed that the aviation industry should insist on both the deletion of these differences, and their resolution. Moreover, no regulation should be allowed where the savings do not exceed the cost; in US safety terms, savings are expressed in terms of lives saved (valued at $650,000 per life in 1983) and the material losses avoided. Examples are provided of aircraft components which have taken these factors into account. The value of airworthiness directives is demonstrated in light of the British Airtours Boeing 737 accident in August, 1985, and it is recommended that authorities be totally independent of their country's manufacturers, operators and accident investigators. It is concluded that air safety regulation is essential; without it, the airlines would be in an even more competitive position. K.K.

**A86-38343**

### HUMAN INJURY CRITERIA RELATIVE TO CIVIL AIRCRAFT SEAT AND RESTRAINT SYSTEMS

R. F. CHANDLER (FAA, Civil Aeromedical Institute, Oklahoma City, OK) SAE, Aerospace Technology Conference and Exposition, Long Beach, CA, Oct. 14-17, 1985. 12 p. refs

(SAE PAPER 851847)

The use of injury criteria as a basis for the acceptance of seats and restraint systems designed to possess some capacity for crash injury protection has been common for several years in military aircraft and automotive systems, but has only recently been considered for civil aircraft systems. This paper will present the background for the concept of 'injury criteria' as distinct from 'voluntary human tolerance', and will explain methods used in developing certain criteria which are most likely to be useful in evaluating civil aircraft seat and restraint system performance. Finally, techniques for using the measurements in testing will be summarized, and guidance will be provided to the system designer which may assist in meeting the goals established by the criteria. Author

### UPPER TORSO RESTRAINT SYSTEMS

E. L. JAERGER (Cessna Aircraft Co., Wichita, KS), H. W. SMITH (Kansas, University, Livermore), and R. F. CHANDLER (FAA, Protection and Survival Laboratory, Oklahoma City, OK) SAE, Aerospace Technology Conference and Exposition, Long Beach, CA, Oct. 14-17, 1985. 8 p.

(SAE PAPER 851848)

A new SAE Aerospace Standard has been developed for upper torso restraint systems in anticipation of mandatory installation in 1986. Shoulder harness integration with pelvic restraint belts are described. Load and performance tests of complete assemblies are described. Details of the system include webbing, seat anchors, buckles, buckle mating plates, adjusters, and emergency locking retractors. Minimum performance requirements and tests for each component are prescribed in the new standard. Tests include effect of flame, light solvents, and abrasion of the webbing. The hardware must qualify for corrosion, temperature and durability. Entire assemblies must be tested to prescribed pelvic and harness loads. These tests are described. Author

**A86-38351**

### CONTROLLED IMPACT DEMONSTRATION REVIEW

N. A. BLAKE (FAA, Washington, DC) SAE, Aerospace Technology Conference and Exposition, Long Beach, CA, Oct. 14-17, 1985. 6 p.

(SAE PAPER 851884)

Data from the controlled impact demonstration conducted on December 1, 1984 by the FAA and NASA are analyzed. The effectiveness of the antimisting fuel additives, seats and restraint systems, and the cabin fire safety materials was evaluated and crashworthiness/crash behavior data was collected. The proposed and actual aircraft impact profiles are described. The test data reveal that the cabin conditions remained habitable, all emergency exits were operable, and the seat fire blocking layers and restraint systems were effective; however, it is observed that under certain conditions the antimisting fuel is not sufficient to prevent a post-crash fire. The crashworthiness data are applied to computer modeling programs for predicting impact forces and crash behavior, and to crash dynamics structural research. I.F.

**A86-38352*** National Aeronautics and Space Administration. Langley Research Center, Hampton, Va.

**NASA EXPERIMENTS ONBOARD THE CONTROLLED IMPACT DEMONSTRATION**

R. J. HAYDUK, E. ALFARO-BOU (NASA, Langley Research Center, Hampton, VA), and E. L. FASANELLA (PRC Kentron, Inc., Hampton, VA) SAE, Aerospace Technology Conference and Exposition, Long Beach, CA, Oct. 14-17, 1985. 13 p.
(SAE PAPER 851885)

The structural crashworthiness tests conducted by NASA on the December 1, 1984 controlled impact demonstration are discussed. The components and locations of the data acquisition and photographic systems developed by NASA to evaluate impact loads throughout the aircraft structure and the transmission of loads into the dummies are described. The effectiveness of the NASA designed absorbing seats and the vertical, longitudinal, and transverse impact loads are measured. Data that is extremely applicable to crash dynamics structural research was obtained by the data acquisition system and very low load levels were measured for the NASA energy absorbing seats. I.F.

**A86-38353**

**ANTIMISTING FUEL TECHNOLOGY FOR TRANSPORT CATEGORY AIRCRAFT**

E. P. KLUEG (FAA, Washington, DC) SAE, Aerospace Technology Conference and Exposition, Long Beach, CA, Oct. 14-17, 1985. 17 p. refs
(SAE PAPER 851886)

The Federal Aviation Administration has been engaged in research and development efforts aimed at reducing the fire hazard during impact-survivable aircraft crashes by modifying kerosene jet fuels. Primary emphasis has been placed on utilizing high molecular weight, polymeric additives to produce antimisting kerosene fuels which are compatible with commercial transport aircraft and engine fuel systems and are more resistant to vaporization, ignition, and flame propagation in the crash situation. The program background is reviewed, and recently-completed research and development efforts are discussed. Topics covered include the rheological, physical, and flammability properties; the airport production techniques; and aircraft fuel system compatibility characteristics of antimisting kerosene fuel. The results of the full-scale validation phase of the program are also discussed, including aircraft ground and flight tests and a full-scale transport aircraft impact demonstration. Author

**A86-38354**

**FAA STRUCTURAL CRASH DYNAMICS PROGRAM UPDATE - TRANSPORT CATEGORY AIRCRAFT**

S. SOLTIS, C. CAIAFA (FAA, Washington, DC), and G. WITTLIN (Lockheed-California Co., Burbank, CA) SAE, Aerospace Technology Conference and Exposition, Long Beach, CA, Oct. 14-17, 1985. 19 p. refs
(SAE PAPER 851887)

The objectives and initial findings of the FAA-sponsored structural crash dynamics research are described. Results from the fuselage drop tests, full scale aircraft drop tests, and the Controlled Impact Demonstration are presented. A computer modeling program for improved transport aircraft crash dynamics, correlated with the test data, is being developed. A seat/occupant model representative of transport category aircraft seats has been developed. I.S.

**A86-38381**

**THE F-16 AIRCRAFT AND HYDRAZINE - AN INDUSTRIAL HYGIENE PERSPECTIVE**

W. D. CHRISTENSEN (USAF, Occupational and Environmental Health Laboratory, Brooks AFB, TX) and J. A. MARTONE (USAF, Harry G. Armstrong Aerospace Medical Research Laboratory, Wright-Patterson AFB, OH) SAE, Aerospace Technology Conference and Exposition, Long Beach, CA, Oct. 14-17, 1985. 7 p. refs
(SAE PAPER 851971)

The USAF program for controlling potential exposure to hydrazine during maintenance of the F-16 aircraft is discussed. The effects of exposure to hydrazine on the skin, eyes, air passages, lungs, the central nervous system, and the liver are described. A maximum eight hour time weighted average airborne concentration of hydrazine to which personnel may be exposed is 0.10 ppm oor 0.13 mg/cu m; procedures for evaluating exposure to hydrazine during aircraft maintenance activities are analyzed. The development of a closed system for maintenance of the F-16 emergency power unit is examined. I.F.

**A86-38382**

**DESIGN, SAFETY, AND MAINTAINABILITY ASPECTS FOR HYDRAZINE USE IN EMERGENCY SECONDARY POWER SYSTEMS**

E. V. SCICCHITANO and E. J. BUNDAS (Grumman Aerospace Corp., Bethpage, NY) SAE, Aerospace Technology Conference and Exposition, Long Beach, CA, Oct. 14-17, 1985. 10 p.
(SAE PAPER 851972)

Emergency power system evaluation will be briefly considered since the approach selected is dependent upon aircraft mission. A rationale for the selection of hydrazine as a primary system, or in conjunction with other systems, has been developed. This paper will address the influence of safety and maintainability considerations upon hydrazine systems design. Concerns in these areas have limited the widespread use of hydrazine in aircraft secondary power systems. To dispel these concerns, extensive experience accumulated to date with hydrazine is examined and applied to operational considerations to provide increased confidence required in considering hydrazine as a viable candidate energy source for aircraft secondary power systems. Author

**A86-38511**

**DATA FOR THE DEVELOPMENT OF CRITERIA FOR GENERAL AVIATION SEAT AND RESTRAINT SYSTEM PERFORMANCE**

R. F. CHANDLER (FAA, Civil Aeromedical Institute, Oklahoma City, OK) IN: Crash dynamics of general aviation aircraft; Proceedings of the General Aviation Aircraft Meeting and Exposition, Wichita, KS, April 16-19, 1985 . Warrendale, PA, Society of Automotive Engineers, Inc., 1985, p. 13-28. refs
(SAE PAPER 850851)

The recommendations of the General Aviation Safety Panel (GASP) for improving crash injury protection in small aircraft are described. A two test procedure for seat and restraint systems was developed. The first test involves forward and downward loading on a seat using a 170 lb dummy and providing an impact velocity of 31 ft/s with a duration of 0.1 s and the second procedure is a forward impact test with an impact velocity of 42 ft/s acting 10 deg to one side of the seat for a 0.1 s duration. The test facility and equipment employed to evaluate the test procedures are examined. The combined vertical and forward test data on seat pan fabrics and adhesive bonds, the elasticity of the adjustment mechanism, armrests, pelvic and shoulder belt load limitations, and head impact are analyzed. The tests revealed that the procedures recommended by GASP provide appropriate performance goals for the seat and restraint systems of small aircraft. I.F.

**LOW ALTITUDE WIND-SHEAR PROTECTION CAN BE ATTAINED**

L. M. GREEN (Safe Flight Instrument Corp., White Plains, NY) ICAO Bulletin, vol. 41, April 1986, p. 10-13.

The development of reliable, highly redundant, and self-contained airborne wind shear warning (WSW) recovery guidance (RG) system designed to complement the ground-based systems to effectively protect against sudden and severe wind shear encounters is described. The WSW system, which includes a radio altimeter, continuously computes the aircraft performance loss due to the combined horizontal and vertical forces of wind shear, and gives audiovisual warnings as the aircraft starts to enter a shear, in time for performance (in nine or more seconds) of a successful recovery maneuver. The RG system then continuously computes attitude guidance for recovery displayed on the pitch command bars of the flight director, requiring the pilot only to follow the command bars to produce the best possible climb profile. Simulator results are discussed. I.S.

**A DEMONSTRATION EXPERT SYSTEM FOR IMPLEMENTING EMERGENCY PROCEDURES IN A HIGH-PERFORMANCE FIGHTER AIRCRAFT**

B. L. BELKIN Apr. 1986 14 p refs

(MAE-1749) Avail: NTIS HC A02/MF A01

A demonstration expert system was developed using a knowledge acquisition tool to simulate the operation of an electronic pilot's assistant operating on-board a high-performance fighter aircraft. The task selected for this simulation was the implementation of in-flight emergency procedures for the canopy loss scenario described in the F-16 Flight Manual. Four modes of pilot assistance operation were identified. Two modes require the Electronic Pilot's Assistant to help the pilot with routine flight tasks. The other two modes require the Electronic Pilot's Assistant to autonomously plan and execute procedures to maintain control of the aircraft in the event the pilot is incapacitated or subject to unmanageable workload. **LIGHTNING DISCHARGE PROTECTION ROD Patent Application**

C. F. BRYAN, JR., inventor (to NASA) 24 Apr. 1986 14 p

Sponsored by NASA

(NASA-CASE-LAR-13470-1; NAS 1.71:LAR-13470-1; US-PATENT-APPL-SN-855983) Avail: NTIS HC A02/MF A01 CSCL 01C

This invention is a system for protecting an in-air vehicle from damage due to the craft sustaining a lightning strike. It is an extremely simple device consisting of a sacrificial graphite composite rod, approximately the diameter of a pencil with a length of about five inches. The sacrificial rod is constructed with the graphite fibers running axially within the rod in a manner that best provides a path of conduction axially from the trailing edge of an aircraft to the trailing end of the rod. The sacrificial rod is inserted into an attachment hole 32 machined into trailing edges of aircraft flight surfaces, such as vertical fin cap 31, and attached with adhesive in a manner not prohibiting the conduction path between the rod and aircraft. The trailing end of rod may be tapered for aerodynamic and esthetic requirements. This rod is sacrificial but has the capability to sustain several lightning strikes and still provide protection. The novelty of this invention appears to reside in a system for protecting the most vulnerable parts of an in-air vehicle when the craft is hit by lightning with an extremely simple and inexpensive device. The materials are easily procured and the sacrificial rod generally can be constructed from the same composite as the flight or control surface to be protected. The protection extends to several in-air lightning strikes and provides protection to aircraft parts manufactured from all materials including organic composites. NASA

(AD-A164828; TR-85422; USAAVSCOM-TR-85-D-11) Avail: NTIS HC A06/MF A01 CSCL 01B

The threshold of spinal injury for seated humans subjected to +Gz loading was investigated. The +Gz loading was induced by simulating crash conditions typically found in helicopter crashes, and modified by the use of energy-absorbing mechanisms incorporated in the seat structure. Fifteen tests were conducted with unembalmed cadavers as human surrogates at various limit-load settings to attempt to identify the load threshold causing spinal injury. Bone strength analysis was used to normalize the results of the cadaver test program. Performance data and autopsy results for the 15 crash tests are presented. A correlation was derived relating the frequency of spinal injury to the energy absorber limit-load factor for use in design of crashworthy seating systems. Comparison of the incidence of spinal injury between the experimental test data developed through testing with cadavers and field performance of production energy-absorbing seats is discussed. The report also contains a discussion of the biomechanics of trauma associated with the human spine, including mechanical properties of the spine, typical injury mechanisms for +Gz loading, and theoretical models for predicting injury. **FLAMMABILITY OF AIRCRAFT HYDRAULIC FLUIDS: A BIBLIOGRAPHY**

Jan. 1986 46 p refs

(Contract DAAK70-86-C-0011)

(AD-A165463; CRC-546) Avail: NTIS HC A03/MF A01 CSCL 11H

As part of an overall effort to collect flammability data on aircraft fluids, a critical survey was made of the aircraft hydraulic oil literature, with particular emphasis on flammability testing and flammability characteristics of existing and projected aircraft hydraulic fluids. Commercial aviation and military aviation fluids are treated separately, in view of their divergent development. Flammability test procedures are described. Flammability test results and other inspection tests are given for a variety of current and proposed aircraft hydraulic fluids. GRA

(PB85-917016; NTSB-SR-85-02) Avail: NTIS MF A01; also available on subscription, North American Continent price HC $60.00/year; all others write for quote CSCL 01C

The report is the last in a series of three reports issued by the National Transportation Safety Board as a result of its General Aviation Crashworthiness Program. The purpose of the program is to provide information to support changes in crashworthiness design standards for seating and restraint systems in general aviation airplanes. A Phase One report presents a methodology for documenting impact severity. A Phase Two report presents specific data on survivable accidents which demonstrate that if all occupants wear shoulder harnesses, fatalities are expected to be reduced by 20 percent. Eighty-eight percent of the seriously injured persons in survivable crashes are expected to experience significantly fewer life-threatening injuries. The Phase Three report provides analytical results of actual crashes. The values of acceleration loads and velocity changes that occupants can sustain in survivable, modern aviation airplane accidents are defined. GRA

(Contract NAG3-284)
(NASA-CR-174919; AR-85-1; NAS 1.26:174919) Avail: NTIS HC A09/MF A01 CSCL 01C

De-icing of aircraft by using the electro-magnetic impulse phenomenon was proposed and demonstrated in several European countries. However, it is not available as a developed system due to lack of research on the basic physical mechanisms and necessary design parameters. The de-icing is accomplished by rapidly discharging high voltage capacitors into a wire coil rigidly supported just inside the aircraft skin. Induced eddy currents in the skin create a repulsive force resulting in a hammer-like force which cracks, de-bonds, and expels ice on the skin surface. The promised advantages are very low energy, high reliability of de-icing, and low maintenance. Three years of Electo-Impulse De-icing (EIDI) research is summarized and the analytical studies and results of testing done in the laboratory, in the NASA Icing Research Tunnel, and in flight are presented. If properly designed, EIDI was demonstrated to be an effective and practical ice protection system for small aircraft, turbojet engine inlets, elements of transport aircraft, and shows promise for use on helicopter rotor blades. Included are practical techniques of fabrication of impulse coils and their mountings. The use of EIDI with nonmetallic surface materials is also described. Author

## AIRCRAFT COMMUNICATIONS AND NAVIGATION

Includes digital and voice communication with aircraft; air navigation systems (satellite and ground based); and air traffic control.

**A86-37334**
**FLIGHT TEST WITH A TERRAIN AIDED NAVIGATION SYSTEM**
E. SKARMAN (Saab Missiles AB, Linkoping, Sweden) IN: Remotely piloted vehicles; International Conference, 5th, Bristol, England, September 9-11, 1985, Proceedings . Bristol, England, University of Bristol, 1985, p. 19.1-19.5. Research supported by the Forsvaret Materielverk.

This article presents flight tests with a terrain-aided inertial navigation system. The system is essentially a nonlinear Kalman filter. The flight tests have been performed in a Sabreliner aircraft, with an altimeter and a strapdown sensor package. The results confirm the simulation model used before, and indicate an 1-sigma error level below 50 m. Author

**A86-37336**
**GROUND CONTROL STATION FOR RPVS**
S. JONES (Ferranti Computer Systems, Ltd., Bracknell, England) IN: Remotely piloted vehicles; International Conference, 5th, Bristol, England, September 9-11, 1985, Proceedings . Bristol, England, University of Bristol, 1985, p. 22.1-22.4.

The ground control stations (GCSs) that furnish an interface between RPVs and their tasking agencies may operate autonomously or by way of a coordinating headquarters. Automatic facilities are used for the allocation of tasks to an RPV, for the generation of detailed routing instructions, and for the transmission of these instructions to the RPV. GCS flexibility is obtained through the use of a variety of manual overrides; the GCS also observes sensor imagery, and generates and transmits reports. Attention is given to mission planning and execution, man/machine interfaces, and communications. O.C.

**A86-37555**

**A TECHNIQUE TO EVALUATE THE ACCESSIBILITY OF AIRBORNE RECEIVERS TO INTERFERING SIGNALS**

D. P. KOESTER, C. E. COOK, and R. R. STEVENS (Mitre Corp., Bedford, MA) IN: ICC '85; International Conference on Communications, Chicago, IL, June 23-26, 1985, Conference Record. Volume 2 . New York, Institute of Electrical and Electronics Engineers, Inc., 1985, p. 814-821. refs

Techniques to evaluate the accessibility of modern military airborne receivers to tactical jammers are described. Signal detection capabilities of the equipment are analyzed in relation to system performance. Problems encountered in examining adaptive antenna arrays are discussed. The procedures for calculating operability volumes are studied. The effects of radio horizon and terrain on line-of-sight communications are investigated. The contours of maximum communications range are estimated and utilized to evaluate the communications performance for a system configuration and an interference environment. I.F.

**SIMULATION AND ANALYSIS OF ANTENNAS RADIATING IN A COMPLEX ENVIRONMENT**

J. J. KIM (Texas Instruments, Inc., McKinney, TX) and W. D. BURNSIDE (Ohio State University, Columbus) IEEE Transactions on Antennas and Propagation (ISSN 0018-926X), vol. AP-34, April 1986, p. 554-562. refs

(Contract NSG-1498)

A numerical procedure for computing the high-frequency radiation patterns of antennas mounted on curved surfaces is described. The procedure utilizes the uniform geometrical theory of diffraction to examine the antenna system's performance, which is dependent on antenna radiation patterns. Composite ellipsoid models of fuselage shapes are developed and the formation of geodesic paths on the models is studied; the shape of the fuselage affects the radiation patterns. The actual field radiated by the source and scattered by the structure is calculated using the ray field technique. The numerical solution is applied to the analysis of the antenna radiation patterns of a military aircraft, private aircraft, and the Space Shuttle orbiter. Good correlation between the calculated and measured radiation patterns is noted verifying the usefulness and accuracy of the numerical procedure. I.F.

**A86-39557**

**MLS - THE PILOT'S POINT OF VIEW [MLS - LE POINT DE VUE DU PILOTE]**

MR. RENOUARD (Union de Transports Aeriens, Puteaux, France) (Seminaire sur le Systeme d'Atterrissage Hyperfrequences 'MLS' Toulouse, France, Nov. 26, 27, 1985) Navigation (Paris) (ISSN 0028-1530), vol. 34, April 1986, p. 145-166. In French.

The benefits and difficulties associated with implementing the Microwave Landing System (MLS) as standard equipment for airline passenger aircraft are considered. MLS offers an elimination of local signal distortions, three-dimensional guidance devoid of local reflectances, and usefulness even when the runway disappears beyond local terrain relief. The precision exceeds that available from current systems during categories I and II landings. Finally, calibration is easier and cheaper. The switchover to MLS from ILS is to be performed over a 12 yr period, implying that the aircraft must carry two different landing guidance systems and pilots must be qualified to operate both of them. The long period of transition would cause a higher fuel consumption rate. It is noted that current display systems do not provide the information in a clear manner, and could be improved by including the MLS in digital display CRT systems, particularly in concert with meteorological displays. Similarly, the MLS and ILS systems could be interoperative and use the same display. Tests are still needed to determine the operability of MLS during category III approaches. Finally, the various on board equipment and procedures associated with implementation of the MLS are discussed. M.S.K.

**A86-39558**

**AIR TRAFFIC CONTROL (ATC) AND VESSEL TRAFFIC SYSTEMS (VTS) [CONTROLE DU TRAFIC AERIEN (ATC) ET SYSTEMES DE TRAFIC DES NAVIRES (VTS)]**

MR. GUICHAROUSSE Navigation (Paris) (ISSN 0028-1530), vol. 34, April 1986, p. 167-179. In French.

The requirements of ATC and marine vessel traffic control (VTS) are compared to demonstrate that existing procedures cannot be gainfully transferred between the two. ATC prevents close approaches between aircraft and between aircraft and other obstructions, and facilitates an orderly, optimized flow of air traffic. Clearances are established among aircraft in terms of the time of flight and the lateral and vertical distances between aircraft. The eyes of the pilots are the primary sensors during visual flight rules, i.e., favorable weather, and are augmented by ATC updates, precision radar systems and ILS approach systems during limited visibility conditions. The ATC therefore has an indispensible role, something that is not true for VTS, since marine vessels can stop almost anywhere and can survive unscheduled stops such as groundings. Separation distances between ships are two-dimensional and horizontal. Ships cannot turn around once inside a channel, and their maneuvering stability can be greatly affected simultaneously by wind forces, currents and tidal streams. The amount of time required for a large vessel to stop or turn can be a significant fraction of an hour. Once committed to a channel or port area and having obtained information from the VTS by VHF phone, ship pilots make few demands on the VTS because too much attention is needed for monitoring what can be an extremely varying array of traffic vessels approaching from every direction, with only radar available as a navigational aid. M.S.K.

**A86-39561**

**A MINIMUM ROUTE TIME (MRT) PROGRAM FOR MICROCOMPUTERS [PROGRAMME DE ROUTE A TEMPS MINIMUM (R.T.M.) POUR MICRO-ORDINATEUR]**

B. GARCON-DUFOUR (Air France, Direction des Operations Aeriennes, Roissy, France) Navigation (Paris) (ISSN 0028-1530), vol. 34, April 1986, p. 207-212. In French.

A program for minimizing flight distances is presented that requires only kilobytes of RAM and therefore can be run on a microcomputer. Isochronous curves are drawn between two points and points requiring equal flight times, hour-by-hour, to reach are identified relative to a straight-line distance between airports. The map of shortest-distance points is thereby generated by mapping the shortest routes for an isobaric flight, for the shortest great circle route, and the shortest route with wind perpendicular to the flight path being taken into account. Corrections are introduced for the different altitudes of departure and arrival, for changes in the strength and direction of the wind, and the air temperature along the routes. Geographic coordinates are then interpolated for the identified shortest route. A sample routing plan is worked out for a 200 nm flight. It is noted that accuracy will be enhanced if two sets of computations are carried out using successive weather maps having the same degree of validity. M.S.K.

**A86-39562**
**THE PRESENCE OF THE TRIDENT III ON ANTARCTICA [PRESENCE DU TRIDENT III SUR LE CONTINENT ANTARCTIQUE]**
B. DUMAS (Thomson-CSF, Division Avionique Spatiale et Aviation Generale, Issy-les-Moulineaux, France) Navigation (Paris) (ISSN 0028-1530), vol. 34, April 1986, p. 223-237. In French.

The Trident III navigation system was installed at several sites and on several aircraft stationed in Antarctica in support of the GANOVEX IV scientific experiments carried out in 1984-85. The airborne platforms were two Dornier 228 aircraft fitted with magnetometers and the CCNS/Trident equipment for aeromagnetism surveys and precision navigation, respectively. The measurements were carried out over a 240,000 sq km region bounded by Ross and Coulman Islands, the polar plateau and the Ross Sea. Nine solar powered ground beacons were established for the Trident system, and situated in groups by elevation from sea level to 3 km altitude. The ground stations were equipped with either omnidirectional or directional antennas to fit the demands of the flight plans. Two interrogator antennas accessing the ground beacons from the two aircraft were coupled to CCNS data analysis computers, which worked continuously in real time acquiring and recording position data. Occasional failures were encountered among the shoreline beacons due to continuous snow or icing conditions blocking off solar energy for several days at a time. The positioning accuracies obtained using the system are estimated to be within 20-40 m for the 40,000 sq km of coverage accomplished. M.S.K.

**A86-39766#**
**AN TERRAIN-AIDED GUIDANCE SYSTEM WITH HIGH CONVERGENCE SPEED**
M. JI (Changsha Institute of Technology, People's Republic of China) Acta Aeronautica et Astronautica Sinica, vol. 7, April 1986, p. 173-180. In Chinese, with abstract in English. refs

A parallel Kalman filter system for terrain-aided guidance, based on the theory of Gaussian Sum in order to meet the requirement of locating flying vehicles with large initial position error, is presented. An order-reduced model is put forth, based on the error analysis of which an adaptive sequential decision (ASD) method is presented. By combining these, the position uncertainty and the amount of calculation can be decreased in steps, and the real-time calculation can be implemented. The performance analysis of ASD gives a practical way to further increase the speed of convergence. It is shown that a fast and accurate location can be provided by the system for a vehicle even with large errors in position, velocity and course. Author

**INTEGRATED RISK/COST PLANNING MODELS FOR THE US AIR TRAFFIC SYSTEM**
J. M. MULVEY and S. A. ZENIOS Dec. 1985 41 p refs
(Contract NAG1-520; NSF DCR-84-01098)
(NASA-CR-177274; NAS 1.26:177274; EES-85-9) Avail: NTIS HC A03/MF A01 CSCL 17G

A prototype network planning model for the U.S. Air Traffic control system is described. The model encompasses the dual objectives of managing collision risks and transportation costs where traffic flows can be related to these objectives. The underlying structure is a network graph with nonseparable convex costs; the model is solved efficiently by capitalizing on its intrinsic characteristics. Two specialized algorithms for solving the resulting problems are described: (1) truncated Newton, and (2) simplicial decomposition. The feasibility of the approach is demonstrated using data collected from a control center in the Midwest. Computational results with different computer systems are presented, including a vector supercomputer (CRAY-XMP). The risk/cost model has two primary uses: (1) as a strategic planning tool using aggregate flight information, and (2) as an integrated operational system for forecasting congestion and monitoring (controlling) flow throughout the U.S. In the latter case, access to a supercomputer is required due to the model's enormous size. **MATH MODEL STUDY OF A PROPOSED GLIDE SLOPE FOR RUNWAY 13R, DALLAS-FORT WORTH AIRPORT, TEXAS**
J. WALLS Jan. 1986 19 p refs
(AD-A164907; DOT/FAA/CT-TN85/80) Avail: NTIS HC A02/MF A01 CSCL 01E

This document describes instrument landing system (ILS) math modeling performed at the request of the Southwest Region. Data are presented showing the computed performance of a proposed glide slope for runway 13R at the Dallas-Fort Worth Airport, Texas. Model path structure and level run plots are provided for capture effect, null reference, and sideband reference systems installed at a location selected by region engineers. Results indicate that all three systems should meet category II path structure, linearity, and symmetry tolerances. The capture effect system provides the smoothest glidepath structure of the three systems modeled. Author (GRA)

Avail: NTIS HC A07/MF A01

With the availability of a world-wide digital terrain data base becoming a reality, it is now possible to carry and display on a tactical aircraft all of the map information needed for a mission. Along with the map display on a color cathode-ray tube (CRT), current targets and mission-specific data can be shown. The limitations of today's commonly used film readers are eliminated by using a digital data base which contains elevation information; one such data base is the U.S. Defense Mapping Agency's Digital Land Mass System (DLMS). The terrain data can be digitally compressed and efficiently stored so that large area coverages may be achieved. With this information readily available, aircraft mission effectiveness and survivability can be enhanced. The system for accomplishing this task is called a digital map generator (DMG). The DMG architecture encompasses data storage, data access and reconstruction, data display processing, and data formatting for use by other aircraft subsystems. A DMG architecture was developed for application in low-level or nap-of-the-Earth tactical missions, as well as long range strategic missions. Mission capabilities are enhanced by using this DMG to support terrain following/terrain avoidance (TF/TA), autonomous navigation, threat avoidance, and weapons delivery. In addition, the same digital processing approach is usable for pre-flight mission planning. The ability to plan a flight using the actual mission data base gives the pilot the ability to see exactly where he will be at all times and to determine safe corridors for entry and departure, making maximum use of terrain shielding. Similarly, the terrain data may be used for reference during post-mission debriefing, in which the pilot can refer to in-flight annotations made through the DMG subsystem. Author

**A NEW TECHNIQUE FOR TERRAIN FOLLOWING/TERRAIN AVOIDANCE GUIDANCE COMMAND GENERATION**

R. V. DENTON, J. E. JONES, and P. L. FROEBERG *In* AGARD Guidance-Control-Navigation Automation for Night All-Weather Tactical Operations 11 p Oct. 1985 refs

Avail: NTIS HC A07/MF A01

A real-time optimization technique that efficiently generates a robust, optimum terrain following/terrain avoidance (TF/TA) trajectory, and has the structural capability for adding threat avoidance is described. The TF/TA technique presented is based on definition of a performance measure that is systematically optimized in real-time. The approach uses on-board Defense Mapping Agency digital terrain elevation data extensively, as updated by real-time sensor inputs. The optimization of the performance measure embodies the real-time trade-off of flying over (TF) versus flying around terrain features (TA). The performance measure is defined to generally penalize large excursions from the nominal (globally-defined) route, while rewarding a trajectory that achieves better terrain masking than contained in the nominal, mission-planned route. Direct incorporation of limits on the flight control variables (bank angle, roll rate, normal acceleration, etc.) is included within the procedure. The TF/TA technique also addresses additional considerations that apply when combining the TF/TA flight trajectory computation with maneuvers through mission waypoints. This involves several subtleties associated with the relative importance of the turning maneuver desired versus the normally applicable TF/TA performance measure. Finally, the relevance of this work to other advances in trajectory computation is described. This includes the relationship to global trajectory generation, and to integrated TF/TA with threat avoidance TF/(TA)2. Author

(NASA-CR-177277; NAS 1.26:177277) Avail: NTIS HC A03/MF A01 CSCL 17G

A systematic approach for monitoring U.S. air traffic was developed in the context of system-wide planning and control. Towards this end, a network optimization model with nonlinear objectives was chosen as the central element in the planning/control system. The network representation was selected because: (1) it provides a comprehensive structure for depicting essential aspects of the air traffic system, (2) it can be solved efficiently for large scale problems, and (3) the design can be easily communicated to non-technical users through computer graphics. Briefly, the network planning models consider the flow of traffic through a graph as the basic structure. Nodes depict locations and time periods for either individual planes or for aggregated groups of airplanes. Arcs define variables as actual airplanes flying through space or as delays across time periods. As such, a special case of the network can be used to model the so called flow control problem. Due to the large number of interacting variables and the difficulty in subdividing the problem into relatively independent subproblems, an integrated model was designed which will depict the entire high level (above 29000 feet) jet route system for the 48 contiguous states in the U.S. As a first step in demonstrating the concept's feasibility a nonlinear risk/cost model was developed for the Indianapolis Airspace. The nonlinear network program --NLPNETG-- was employed in solving the resulting test cases. This optimization program uses the Truncated-Newton method (quadratic approximation) for determining the search direction at each iteration in the nonlinear algorithm. It was shown that aircraft could be re-routed in an optimal fashion whenever traffic congestion increased beyond an acceptable level, as measured by the nonlinear risk function. B.W.

**TCAS EXPERIMENTAL UNIT (TEU) HARDWARE DESCRIPTION**

D. A. SPENCER, R. R. LAFREY, J. DIBARTOLO, and W. H. HARMAN 6 Jun. 1986 129 p

(Contract F19628-85-C-0002; DOT-FA77WAI-817)

(FAA/PM-85/2; PR-ATC-133) Avail: NTIS HC A07/MF A01

The hardware design of the TCAS Experimental Units (TEU's) constructed by Lincoln Laboratory to support the design and validation of the Traffic Alert and Collision Avoidance System (TCAS) for the FAA is described. Section 1.0 presents an overview of the operation of the TEU's in order to give some context for the hardware design. References are given to more extensive descriptions of the TCAS system operation and software design. Section 2.0 constitutes the bulk of the report, and is a detailed description of the TEU hardware design. The purpose of this description is to document the design details of the equipment which was used to develop and validate the signal processing techniques and algorithms which appear in the TCAS II Minimum Operational Performance Standard, the TCAS National Standard and various technique reports listed in the references. A second purpose is to provide design guidance to potential TCAS II manufacturers, in the form of a detailed description of a feasible design with documented performance. Finally, this document is a manual for future use and maintenance of the TEU's. Author

**TECHNICAL SUPPORT OF THE WALL STREET/BATTERY PARK CITY HELIPORT MLS (MICROWAVE LANDING SYSTEM) PROJECT Technical Note, Jan. - Jun. 1985**
B. R. BILLMANN, J. H. ENIAS, and M. WEBB Dec. 1985 78 p
(AD-A165073; DOT/FAA/CT-TN85/58) Avail: NTIS HC A05/MF A01 CSCL 17G

During the winter and spring of 1985, the Federal Aviation Administration (FAA) Eastern Region in conjunction with the Guidance and Airborne Systems Branch at the FAA Technical Center conducted a demonstration of a Microwave Landing System (MLS) located at a downtown heliport. This report describes both the industry/user and FAA Technical Center activities during the evaluation period. It describes the evaluation methodology and addresses topics concerning both technical and operational issues. It also describes the helicopter procedures flown during this evaluation and provides an analysis of signal coverage and the user's subjective opinions concerning the acceptability and perceived workload associated with these procedures. It was concluded that MLS to heliports is a viable asset to the helicopter Instrument Flight Rules (IFR) community; however, its full benefits may not be realized in the Battery Park/Wall Street area without revisiting the necessity and demand for the New York Terminal Control Area (TCA) Visual Flight Rules (VFR) operating exclusion area. **IMPROVEMENT OF STRAPDOWN SYSTEM PERFORMANCE BY MEANS OF NUMERICAL METHODS Final Report, Dec. 1984**
H. BUITKAMP, K. ENDERLEIN, G. EVERETT, U. KIRCHHOFF, M. KLEINSCHMIDT, D. OZDES, and P. STEIERT Bonn Bundesministerium fuer Forschung und Technologie Nov. 1985 130 p In GERMAN; ENGLISH summary Sponsored by Bundesministerium fuer Forschung und Technologie
(BMFT-FB-W-85-011; ISSN-0170-1339; LITEF-105-793) Avail: NTIS HC A07/MF A01; Fachinformationszentrum, Karlsruhe, West Germany DM 27.50

Software methods to improve the performance of strapdown systems, and the simulation tools used in the analysis of system mechanisms are presented. Models of the inertial and external sensors to compensate for systematic errors; correct timing of the data flow of the sensors; multiposition alignment to eliminate the day-to-day repeatability of gyro biases; design control loops with optimal/suboptimal filters for special tasks of a strapdown unit (e.g., helicopter mission, initial alignment) are described. Kalman filters are used to reduce the influence of stochastic errors and for cross calibration of the sensors. ESA

**REMOTELY PILOTED VEHICLES; INTERNATIONAL CONFERENCE, 5TH, BRISTOL, ENGLAND, SEPTEMBER 9-11, 1985, PROCEEDINGS AND SUPPLEMENTARY PAPERS**
Conference sponsored by the Royal Aeronautical Society and University of Bristol. Bristol, England, University of Bristol, 1985. Proceedings, 174 p.; Supplementary Papers, 87 p. For individual items see A86-37327 to A86-37345.

The present conference gives attention to British Army and Navy RPV requirements, safe mini-RPV operation for civil users, high altitude meteorological RPVs, the British Army's Phoenix battlefield surveillance system, the CL-227 Rotary wing RPV, and the design of compact electromechanical actuators for RPV flight control. Also discussed are a thermal imaging payload for RPV applications, thermal-IR zoom optics for RPV sensors, the Phoenix RPV as sensor turret system, RPV flight testing with a terrain-aided navigation system, the real time simulation of a nonlinear RPV incorporating HUD-type color graphics, a flywheel-powered RPV launcher, and a compressed air-driven RPV launching system. O.C.

**THE DEVELOPMENT OF Z-2 REMOTELY PILOTED HELICOPTER**
W. X. CHUN (Nanjing Research Institute on Simulation Technique, People's Republic of China) IN: Remotely piloted vehicles; International Conference, 5th, Bristol, England, September 9-11, 1985, Proceedings . Bristol, England, University of Bristol, 1985, p. 6.1-6.12.

Z-2 is a research Remotely Piloted Helicopter (RPH) for feasibility study, developed by Nanjing Research Institute on Simulation Technique (NRIST). It is the first remotely piloted helicopter of 20-30 kg class (T-O weight) developed by the PRC, and success has been obtained in flight tests. This paper describes briefly the Z-2 RPH and its development process, giving informations and analyses, with special emphasis on the designing and building of the composite main rotor blades, the main technical problems encountered and the approaches to solve them, as well as the results of flight tests. **HIGH ALTITUDE UNMANNED AIRCRAFT FOR METEOROLOGICAL APPLICATIONS - HIMET**
D. W. ALLEN (Theta Analysis and Systems, Ltd., Aldershot, England) and M. C. PUTTOCK (Thorn EMI Electronics, Ltd., Hayes, England) IN: Remotely piloted vehicles; International Conference, 5th, Bristol, England, September 9-11, 1985, Proceedings . Bristol, England, University of Bristol, 1985, p. 7.1-7.17. Research sponsored by the Ministry of Defence (Procurement Executive).

A design configuration study has been conducted for an RPV platform able to carry experimental payloads weighing up to 15 kg to an altitude of 50,000 ft, remaining on station at that altitude for up to 4 h. This RPV, designated 'HIMET', has in the course of the design process been defined with respect to airframe type, propulsion system type, weight budget compliance, and required performance. A turbojet-powered sailplane was ultimately chosen as the HIMET platform. Attention is given to autopilot and control system options, launch and recovery operations, and operational meteorological coverage. O.C.

**CANADAIR ROTARY WING, FULL SCALE ENGINEERING DEVELOPMENT. III**
R. J. ATKINS (Canadair, Ltd., Montreal, Canada) IN: Remotely piloted vehicles; International Conference, 5th, Bristol, England, September 9-11, 1985, Proceedings . Bristol, England, University of Bristol, 1985, p. 11.1-11.14.

The CL-227 is a rotary wing RPV which is about to enter full scale engineering development. Attention is presently given to the design changes and consequent performance improvements that have accumulated in the course of technology development testing, such as an increase in takeoff mass that has resulted in increased endurance and payload capability. Greater engine output, improved maintainability/reliability, and an enhanced continuous navigation capability are additional consequences of developmental changes in design. O.C.

**A86-37338**
**ENHANCED MISSION VERSATILITY OF THE AQUILA RPV SYSTEM**
G. S. MELOY and M. A. LEVIN (Lockheed Missiles and Space Co., Inc., Austin, TX) IN: Remotely piloted vehicles; International Conference, 5th, Bristol, England, September 9-11, 1985, Supplementary Papers . Bristol, England, University of Bristol, 1985, p. 5.1-5.11.

A comprehensive account is given of the development history, design configurations, subsystems integrations, mission profiles, and performance capabilities of the U.S. Army's Aquila RPV Target Acquisition, Designation and Reconnaissance System. Aquila encompasses such operational capabilities as real time imagery, accurate guidance and navigation at maximum range, a highly stabilized multiple field-of-view payload, an antijam data link, a low observability airframe, and integrated logistics support. Attention is given to the Aquila mission's impact on system cost and complexity, and the spectrum of mission types that can be accommodated in virtue of Aquila's extensive use of modular/exchangeable design features. O.C.

**A86-37339**
**BOEING ROBOTIC AIR VEHICLE**
D. E. SLADOVNIK (Boeing Military Airplane Co., Wichita, KS) IN: Remotely piloted vehicles; International Conference, 5th, Bristol, England, September 9-11, 1985, Supplementary Papers . Bristol, England, University of Bristol, 1985, p. 27.1-27.5.

Attention is given to the design features, operational capabilities and mission profiles of the BRAVE-200 Robotic Air Vehicle, which is a low-cost, mission-adaptable minidrone. The mission types encompassed by BRAVE-200's capabilities are destructive and disruptive air defense suppression and battlefield surveillance and reconnaissance. Navigation accuracy, loiter patterns, and mission area performance are all functions of specific mission requirements. O.C.

**A86-37340**
**THE PHOENIX AIR VEHICLE, ITS LAUNCH AND RECOVERY**
P. S. TURNER (Flight Refuelling, Ltd., Wimborne, England) IN: Remotely piloted vehicles; International Conference, 5th, Bristol, England, September 9-11, 1985, Supplementary Papers . Bristol, England, University of Bristol, 1985, p. 10.1-10.9.

An account is given to the design features and launch and recovery procedures of the Phoenix RPV, with attention to the way in which simplicity, low detectability and mission criteria influenced design. The Phoenix RPV encompasses a 'taxi' module, comprising the aerodynamic surfaces and controls, engine, electrical generator, and parachute recovery system, on the one hand, and on the other a separate 'mission system pod' module. The advantages of a parachute recovery system are discussed. O.C.

**A86-37465**
**AIRCRAFT ICING OBSERVATIONS AND ANALYSIS**
W. SAND (Wyoming, University, Laramie) IN: International Conference on the Aviation Weather System, 2nd, Montreal, Canada, June 19-21, 1985, Preprints . Boston, MA American Meteorological Society, 1985, p. 94-96.
(Contract USBR-7-07-83-V0001)

An account is given of the results of University of Wyoming aircraft icing effects studies concerned with the location and measurement of supercooled liquid water and with such cloud microphysical parameters as supercooled cloud droplet size spectra. The studies indicate that aircraft climb capability decreases due to icing could be predicted through the examination of the derived parameter designated 'potential accumulation'. Icing effects are illustrated photographically. O.C.

**FULL-SCALE TILT-ROTOR HOVER PERFORMANCE**
F. F. FELKER, M. D. MAISEL, and M. D. BETZINA (NASA, Ames Research Center, Moffett Field, CA) American Helicopter Society, Journal (ISSN 0002-8711), vol. 31, April 1986, p. 10-18. refs

The hover performance of three full-scale rotors was measured at the Ames Outdoor Aerodynamic Research Facility. The rotors, all designed for tilt-rotor aircraft, were the original metal blades for the XV-15 Tilt Rotor Research Aircraft, a set of composite, advanced technology blades for the XV-15, and a 0.658-scale model of the proposed V-22A Osprey (JVX) rotor. The composite advanced technology blades for the XV-15 were tested with several alternate blade root and blade tip configurations. This paper presents the performance of these three rotors, shows the effects of tip Mach number and root and tip configuration changes on rotor performance, and presents data on rotor wake velocity distributions and tip vortex geometry. Measured rotor performance is compared with theoretical predictions, and the discrepancies are discussed. Author

**A86-37772*** Maryland Univ., College Park.
**GUST RESPONSE OF HINGELESS ROTORS**
G. S. BIR and I. CHOPRA (Maryland, University, College Park) American Helicopter Society, Journal (ISSN 0002-8711), vol. 31, April 1986, p. 33-46. refs
(Contract NAG1-375)

The gust response of a coupled hingeless rotor-fuselage system is studied in both hover and forward flight. Each rotor blade undergoes flap bending, lag bending, and torsional deflections. The blades are discretized into beam elements, each with fifteen nodal degrees of freedom. The fuselage is permitted three translational (vertical, longitudinal, and lateral) and two rotational (pitch and roll) degrees of freedom. The formulation considers a three-dimensional gust field wherein each gust velocity component can have an arbitrary variation in space and time. Aerodynamic loads are obtained using quasisteady strip theory. Wake-induced effects are introduced through dynamic inflow modeling. Dynamic stall and reverse flow effects are also included. Equations governing the rotor-fuselage gust response are linearized about the vehicle propulsive trim state and the blade steady-state defected positions, and solved by time integration. The effects of several parameters on the helicopter gust response are illustrated, including dynamic inflow, lag stiffness, forward speed, gust profile, gust penetration rate, and gust velocity direction. Author

**EFFECTIVENESS OF CURRENT DYNAMIC-INFLOW MODELS IN HOVER AND FORWARD FLIGHT**
G. H. GAONKAR (Florida Atlantic University, Boca Raton) and D. A. PETERS (Georgia Institute of Technology, Atlanta) American Helicopter Society, Journal (ISSN 0002-8711), vol. 31, April 1986, p. 47-57. refs
(Contract DAAG29-80-C-0092)

A brief overview of dynamic inflow theory is given, including its history and its dependence on experimental data. Some of the most extensive of this data, flapping response derivatives obtained in 1972-1974, indicated that theoretical predictions which included the best dynamic-inflow models of that time were qualitatively as well as quantitatively inaccurate. In this paper, these original flapping data (some of which have never been compared to theory in the literature) are compared with theory which includes a more recently developed model of dynamic inflow. The correlation is excellent at most frequencies and advance ratios, and the new model brings the theory into qualitative agreement with experiment in all conditions. Author

**A UNIFIED FORMULATION OF ROTOR LOAD PREDICTION METHODS**
R. E. HANSFORD (Westland Helicopters, Ltd., Yeovil, England) American Helicopter Society, Journal (ISSN 0002-8711), vol. 31, April 1986, p. 58-65. refs

The relative merits and limitations of the Modal Summation and Force Integration approaches to rotor load calculations are discussed. A simple analysis, called the Unified Formulation Method, is devised which converts a Modal Summation approach into Force Integration when necessary. Application to lag damper modeling resulted in an improved correlation of edgewise bending moments near the blade root. Further use of this method is demonstrated for load calculations of higher mode torsional forcings induced by varying pitching moments of advanced multiprofile blades. Author

**AERODYNAMICS AND RADAR-SIGNATURE - A THEORETICAL APPROACH TO ESTIMATE THE RADAR-SIGNATURE OF COMPLEX AIRCRAFT CONFIGURATIONS COMPATIBLE WITH AERODYNAMIC PANEL-METHODS**
S. M. HITZEL (Dornier GmbH, Friedrichshafen, West Germany) IN: Applied Aerodynamics Conference, 4th, San Diego, CA, June 9-11, 1986, Technical Papers . New York, American Institute of Aeronautics and Astronautics, 1986, p. 46-52. refs
(AIAA PAPER 86-1770)

Combat-aircraft are threatened by radar-controlled anti-aircraft systems. Reduced radar-signature is a means to improve the capabilities to penetrate enemy defense systems. The knowledge of the back-scatter of electromagnetic waves from aircraft makes it possible to design a low radar-signature or at least to improve the tactics of aircraft already in service to avoid successful energy defence reaction. A theoretical approach is presented to estimate the radar-signatures of complex military aircraft-configurations including external stores. The signature is evaluated by the determination of the radar-cross-sections of intended radar-observation-directions. The radar-cross-section of a certain aspect view of a radar-observation is determined by the means of a combination of specular geometrical and physical optics with the evaluation of the radar-reflection characteristics of configuration elements being small compared to the radar's wave-length. The geometric input is equal to the build-up of usual aerodynamic panel-methods. Thus an aerodynamic surface-discretization can be used without modification. The signature of a fighter aircraft, armed and unarmed, exposed to typical radar illumination is presented. Author

**WIND TUNNEL TEST OF A MODEL ROTOR WITH A FREE-TIP**
R. H. STROUB (NASA, Ames Research Center, Moffett Field, CA), H. KUMAGAI (University of Kansas Center for Research, Inc., Lawrence), and C. KEYS (Boeing Vertol Co., Philadelphia, PA) IN: Applied Aerodynamics Conference, 4th, San Diego, CA, June 9-11, 1986, Technical Papers . New York, American Institute of Aeronautics and Astronautics, 1986, p. 97-109.
(AIAA PAPER 86-1781)

A model helicopter rotor with a free tip was tested in a wind tunnel to show the effect of the free tip on rotor performance and oscillatory loads. The free-tip rotor has blade tips that are free to pitch independently of the remainder of the blade. A nearly constant pitching moment is applied to the tip so the tip will produce a nearly steady lift around the azimuth. The aerodynamic development of the free tip is reviewed. The development process concentrated on configuring the tip to have the capability of fast response to angle-of-attack perturbations. Wind tunnel test results show the free-tip rotor configuration requires less power than a fixed-tip configuration in forward flight. In addition, the free tip causes substantial reduction in blade-flapwise vibratory loads. However, blade-chordwise loads were increased. Pitch-link vibratory loads were also reduced by the free-tip configuration. Discussion is presented on the reasons that the use of the free tip caused reduced power and smaller vibratory loads. Author

**EXPERIMENTAL INVESTIGATION OF ROTORCRAFT HUB AND SHAFT FAIRING DRAG REDUCTION**
L. A. YOUNG and D. R. GRAHAM (NASA, Ames Research Center, Moffett Field, CA) IN: Applied Aerodynamics Conference, 4th, San Diego, CA, June 9-11, 1986, Technical Papers . New York, American Institute of Aeronautics and Astronautics, 1986, p. 110-123. refs
(AIAA PAPER 86-1783)

A wind-tunnel test was conducted to obtain data on several rotorcraft hub and shaft fairing drag reduction configurations. Aerodynamic loads and moments were acquired for each test configuration. Limited wake pressure measurements and flow visualization (tuft) photographs were obtained for some configurations. All hub and shaft fairing configurations were tested on a 1/5-scale XH-59A model fuselage. Both coaxial and single rotor configurations were tested. All rotor assemblies were modeled with nonrotating hardware. The drag reduction methods tested included cambered elliptical hub fairings, several different shaft fairings, and strakes. Test data show that significant drag reductions can be attained with certain fairing configurations. The lowest drag values for the single rotor configurations were obtained for a cambered elliptical hub fairing with a large thickness airfoil shaft fairing. The lowest coaxial configuration drag values were obtained with cambered elliptical hub fairings and a long chord intermediate shaft fairing. Author

**APPLICATION OF NCOREL TO AIRCRAFT CONFIGURATIONS**
M. J. SICLARI (Grumman Corporate Research Center, Bethpage, NY) and J. L. PITTMAN (NASA, Langley Research Center, Hampton, VA) IN: Applied Aerodynamics Conference, 4th, San Diego, CA, June 9-11, 1986, Technical Papers . New York, American Institute of Aeronautics and Astronautics, 1986, p. 355-367. refs
(Contract NAS1-16758)
(AIAA PAPER 86-1830)

The NCOREL computer program and methodology (Grossman, 1979) modified for computation of flows over complex geometries is described. The newly introduced features include a more flexible grid-generation package, capable of generating grids for realistic wing-body cross sections, and a more general numerical method, developed for the capture of highly three-dimensional embedded, oblique shocks. In addition, an inlet capability is included, by means of which the cross section is allowed to change discontinuously with the addition of the inlet geometry. The new cross section is regridded and the potentials and their derivatives are interpolated for the marching to continue. Hence, a discontinuity in the grid or mappings is taken into account at the inlet station. The results of the flow-field computation for a realistic fighter configuration are discussed. I.S.

**EULER CALCULATIONS FOR FLOWFIELD OF A HELICOPTER ROTOR IN HOVER**
R. K. AGARWAL and J. E. DEESE (McDonnell Douglas Research Laboratories, St. Louis, MO) IN: Applied Aerodynamics Conference, 4th, San Diego, CA, June 9-11, 1986, Technical Papers . New York, American Institute of Aeronautics and Astronautics, 1986, p. 425-433. Research sponsored by the McDonnell Douglas Independent Research and Development Program. refs
(AIAA PAPER 86-1782)

Aerodynamic loads on a multibladed helicopter rotor in hovering flight are calculated by solving the three-dimensional Euler equations in a rotating coordinate system on body-conforming curvilinear grids around the blades. Euler equations are recast in the absolute flow variables so that the absolute flow in the far field is uniform but the relative flow is nonuniform. Equations are solved for the absolute flow variables employing Jameson's finite-volume explicit Runge-Kutta time-stepping scheme. Rotor-wake effects are modeled in the form of a correction applied to the geometric angle of attack along the blades. This correction is obtained by computing the local induced downwash with a free-wake analysis program. The calculations are performed on a CRAY X/MP-48 for a model helicopter rotor in hover at various collective pitch angles. The results are compared with experimental data. Author

**EAP - FIGHTER BLUEPRINT**
G. WARWICK and T. HALL Flight International (ISSN 0015-3710), vol. 129, April 19, 1986, p. 25-30.

The EAP high-performance fighter aircraft, designed by Great Britain for flight this year, is described in detail. EAP is a single-seat delta-canard aircraft powered by two extended-reheat Turbo-Union RB. 199s. The design emphasis is on air-combat performance; attention is therefore focused on attained sustained turn rates and specific excess power. EAP represents a compromise between the design requirements of both beyond-visual-range and close-in combat. Pitch control is provided by the all-moving foreplane and wing trailing-edge flaperons programmed with airspeed and angle of attack. Roll control is provided by the flaperons which are fully spanned at moderate speed and inboard only at high speed. Since it is designed for angles of attack up to 30 degrees, the EAP has a chin (air) intake with a unique hinged lowerlip. Aside from this high-angle-of-attack, EAP is also capable of transonic acceleration, supersonic flight and short landing. One of the areas to be investigated is the reduction of aircraft infrared and radar cross-sections so as to escape early detection. It is concluded that the EAP is both fast-reacting and easily maneuverable. K.K.

**HAWK - THE BRITISH FIGHTING TRAINER**

K. G. HODSON (British Aerospace, PLC, Surrey, England) SAE, Aerospace Technology Conference and Exposition, Long Beach, CA, Oct. 14-17, 1985. 34 p.

(SAE PAPER 851768)

A development history is presented for the Hawk family of advanced jet trainer and attack aircraft, whose primary goals have been the achievement of low life cycle and acquisition costs, low fuel consumption, high reliability and structural integrity, and ease of maintenance and manufacture. Attention is given to design development program management lessons learned, the criteria used in choosing among alternative airframe configurations, and the weapons packages used by attack versions of the trainer. O.C.

**A86-38304**

**THE EMB-312 TUCANO - A BRAZILIAN TRAINER**

O. SILVA (Embraer-Empresa Brasileira de Aeronautica, S. A., Sao Jose dos Campos, Brazil) SAE, Aerospace Technology Conference and Exposition, Long Beach, CA, Oct. 14-17, 1985. 14 p.

(SAE PAPER 851769)

The design of the EMB-312 Tucano Brazilian advanced trainer is described. The high performance trainer is a low-wing monoplane with a single turboprop engine. The structure of the aircraft is a 2024 Al alloy stressed-skin type with wings and empennage in cantilever construction. The components and operation of the fuel, hydraulic, electrical and avionics systems of the trainer are examined. The advantages provided by the jetlike characteristics of the engine, single throttle lever, ejection seat, and staggered tandem cockpit seats of the trainer are discussed. The performance and fatigue life of the aircraft are evaluated; the trainer displays excellent aerobatic capabilities and a safe service-life of 6000 hours. I.F.

**X-WING - A LOW DISC-LOADING V/STOL FOR THE NAVY**

J. C. BIGGERS (David W. Taylor Naval Ship Research and Development Center, Bethesda, MD) and A. W. LINDEN (United Technologies Corp., Sikorsky Aircraft Div., Stratford, CT) SAE, Aerospace Technology Conference and Exposition, Long Beach, CA, Oct. 14-17, 1985. 17 p. refs

(SAE PAPER 851772)

The X-wing concept used in the design of the NASA/Army Rotor Systems Research Aircraft (RSRA) rotor wing is described. The X-wing VTOL concept uses a helicopter-like rotor system, but stops the rotor/wing in flight and uses it as the fixed wing. The major elements in the RSRA/X-wing project are the rotor/wing system, the fly-by-wire control system, the compressor supplying the Coanda blowing air, and the modifications to the RSRA drive train. The X-wing can provide one aircraft with fixed-wing cruise efficiency, helicopter-like hover efficiency and hover control power, 0 to 300-knot one-engine inoperative capability and acceptable empty weight/gross weight ratios. I.S.

**LEADING-EDGE DESIGN FOR IMPROVED SPIN RESISTANCE OF WINGS INCORPORATING CONVENTIONAL AND ADVANCED AIRFOILS**

H. P. STOUGH, III, F. L. JORDAN, JR., D. J. DICARLO, and K. E. GLOVER (NASA, Langley Research Center, Hampton, VA) SAE, Aerospace Technology Conference and Exposition, Long Beach, CA, Oct. 14-17, 1985. 17 p. refs

(SAE PAPER 851816)

Discontinuous wing leading-edge droop designs have been evaluated as a means of modifying wing autorotative characteristics and thus improving airplane spin resistance. Addition of a discontinuous outboard wing leading-edge droop to three typical light airplanes having NACA 6-series wing sections produced significant improvements in stall characteristics and spin resistance. Wind tunnel tests of two wings having advanced natural laminar flow airfoil sections indicated that a discontinuous leading-edge droop can delay the onset of autorotation at high angles of attack without adversely affecting the development of laminar flow at cruise angles of attack. **THE STOL PERFORMANCE OF A TWO-ENGINE, USB POWERED-LIFT AIRCRAFT WITH CROSS-SHAFTED FANS**

V. C. STEVENS, S. B. WILSON, III (NASA, Ames Research Center, Moffett Field, CA), and C. A. ZOLA (NASA, Lewis Research Center, Cleveland, OH) SAE, Aerospace Technology Conference and Exposition, Long Beach, CA, Oct. 14-17, 1985. 8 p.

(SAE PAPER 851839)

The short takeoff and landing capabilities that characterize the performance of powered-lift aircraft are dependent on engine thrust and are, therefore, severely affected by loss of an engine. This paper shows that the effects of engine loss on the short takeoff and landing performance of powered-lift aircraft can be effectively mitigated by cross-shafting the engine fans in a twin-engine configuration. Engine-out takeoff and landing performances are compared for three powered-lift aircraft configurations: one with four engines, one with two engines, and one with two engines in which the fans are cross-shafted. The results show that the engine-out takeoff and landing performance of the cross-shafted two-engine configuration is significantly better than that of the two-engine configuration without cross-shafting. **REQUIREMENTS FOR FUTURE RALS/STOVL OPERATING CONCEPTS**

D. J. MCNALLY and D. M. BROWN (Northrop Corp., Aircraft Div., Hawthorne, CA) SAE, Aerospace Technology Conference and Exposition, Long Beach, CA, Oct. 14-17, 1985. 9 p.

(SAE PAPER 851840)

The particular application of the Remote Augmented Lift System (RALS) to tactical short take-off, vertical landing (STOVL) aircraft enables configurations to be designed that possess significant supersonic performance in addition to subsonic/transonic performance. Future tactical fighter aircraft for the 1995 time frame should be flexible enough to cover various roles, e.g., close air support (CAS)/battlefield air interdiction (BAI), and have significant air-to-air capability with rapid redeployment potential in the face of a changing battle scenario. In addition, these aircraft must possess superior lethality, survivability and availability characteristics. STOVL concepts make a distinct contribution to availability by virtue of allowing remote austere basing operations. Recent operational studies have identified new requirements for basing, support, and new technologies that could greatly improve sortie generation capability. This paper discusses requirements for a RALS/STOVL concept operating in this environment. Author

**THE IMPACT OF TECHNOLOGY ON FIGHTER AIRCRAFT REQUIREMENTS**

S. M. DOLLYHIGH and W. E. FOSS, JR. (NASA, Langley Research Center, Hampton, VA) SAE, Aerospace Technology Conference and Exposition, Long Beach, CA, Oct. 14-17, 1985. 10 p.
(SAE PAPER 851841)

Technology integration studies were made to examine the impact of emerging technologies on fighter aircraft. The technologies examined included advances in aerodynamics, controls, structures, propulsion, and systems and were those which appeared capable of being ready for application by the turn of the century. A primary impetus behind large increases in figher capability will be the rapid increase in fighter engine thrust-to-weight ratio. High thrust-weight engines, integrated with other advanced and emerging technologies, can result in small extremely maneuverable fighter aircraft that have thrust-weight ratios of 1.4+ and weight one-half as much as today's fighters. Future fighter aircraft requirements are likely to include a turn capability in excess of 7g's throughout much of the maneuver envelope, post-stall maneuverability, STOVL or VTOL, and a single engine for low cost. **EFFECTS OF JET FLAP ON AV8-B 'HARRIER' PERFORMANCE**

A. S. HAHN and S. B. WILSON, III (NASA, Ames Research Center, Moffett Field, CA) SAE, Aerospace Technology Conference and Exposition, Long Beach, CA, Oct. 14-17, 1985. 45 p. refs
(SAE PAPER 851843)

This paper examines the effects of fitting various jet-flap configurations to an AV8-'Harrier II' Baseline aircraft using two NASA developed computer codes. The first code predicts the ground roll of an AV8-B with a partial span jet-flap, a full span jet-flap, a partial span internally blown-flap, and a full span internally blown-flap as well as the Baseline configuration. The second code used was a mission performance estimation routine called ACSYNT (Aircraft Synthesis). This code models each configuration on a standard mission so that the relative merits may be determined. Author

**FOLDING TILTROTOR TECHNOLOGY DEMONSTRATOR - THE NEXT STEP FOR TILTROTOR TECHNOLOGY**

D. P. GLEITER (Boeing Vertol Co., Philadelphia, PA) SAE, Aerospace Technology Conference and Exposition, Long Beach, CA, Oct. 14-17, 1985. 8 p. refs
(SAE PAPER 851844)

Based on a comparative study of competing V/STOL concepts, the folding tiltrotor offers many advantages for missions requiring long endurance combined with a speed capability in excess of 400 knots. Folding tiltrotor technology development began in 1967 and the results of wind tunnel tests and design studies show no significant technical obstacles to the development of a folding tiltrotor aircraft. The convertible fan/shaft CTFS-34 engine can be used to power a technology demonstrator aircraft. The next step in the development of tiltrotor technology should be a folding tiltrotor technology demonstrator based on either the V-22 or the S-3A. Author

**RESULTS OF PILOTED SIMULATION OF GRUMMAN DESIGN 698**

J. W. CLARK, JR., S. T. DONLEY, and J. B. JOHNS (U.S. Navy, Naval Air Development Center, Warminster, PA) SAE, Aerospace Technology Conference and Exposition, Long Beach, CA, Oct. 14-17, 1985. 14 p.
(SAE PAPER 851846)

The third in a series of three piloted simulations of the Grumman Design 698 Tilt-Fan V/STOL Demonstrator was conducted at NASA Ames Research Center on the Vertical Motion Simulator. Both single-engine-failure characteristics (with and without engine cross-shafting) and hover/low-speed handling qualities were investigated. Based on minimum recovery speed, altitude loss, and ejection capability following a single engine failure, the cross-shafted configuration offers a substantial increase in flight safety over the non-cross-shafted configuration. Based on handling qualities ratings, touchdown performance, and pilot comments, attitude command/attitude hold or translational rate command/translational rate hold response type control systems yield satisfactory handling qualities during shipboard terminal operations. **HARRIER III-AV8B WITH A MODERN ENGINE**

S. B. WILSON, III (NASA, Ames Research Center, Moffett Field, CA) and J. M. WURTS (California Polytechnic State University, San Luis Obispo, CA) SAE, Aerospace Technology Conference and Exposition, Long Beach, CA, Oct. 14-17, 1985. 14 p. refs
(SAE PAPER 851881)

The paper examines the application of a 26, 156-lb thrust engine (which is 30 percent more thrust than the short-lift dry rating on the F402-RR-406 Pegasus engine) to an AV-8B aircraft. This modern engine has 30 percent more thrust than the F402-RR-406 Pegasus engine with no increase in engine weight; the weight is assumed to be constant for both engines. The paper focuses on the benefit to the AV-8B in increasing short takeoff gross weight and vertical landing weight. A second comparison is made between the bigger engine with the existing thrust-versus-SFC curve, and a 10 percent lower SFC curve. The notion of a modern engine with 10 percent lower SFC and 30 percent more thrust for the same size and weight is presented as a hypothesis, and is not supported by discussing engine technology. There are no engine data or technical discussion as to how the modern engine is constructed or which manufacturer could build it. The performance estimates are generated by ACSYNT, a NASA developed computer code that is available to U.S. industry and has been reported on in a number of other publications. Author

**A VERIFICATION OF PROPULSION AND AIRPLANE PERFORMANCE MODELS GENERATED FROM FLIGHT**

P. V. DONLAN (Kohlman Systems Research, Inc., Lawrence, KS) SAE, Aerospace Technology Conference and Exposition, Long Beach, CA, Oct. 14-17, 1985. 8 p.
(SAE PAPER 851899)

Performance modeling is a process where a representative nominal engine model is calibrated to the test engines as installed on the test airplane. Research initiated by Schweikhard and Marshall at NASA and further developed at the University of Kansas has shown that performance modeling is a viable and inexpensive alternative to in-flight thrust measurements or calibrated engines. Testing using this method has been performed on twelve business jets. On one of these programs, both calibrated engines and a nominal engine model were available; thus verification of performance modeling was possible. Through this verification process it was shown that similar drag polars resulted from the two methods. A difference in drag was found to be no greater than 20 counts. This paper describes the methods used for the performance modeling, which includes propulsion modeling methods and flight test procedures. The resulting flight test data are presented. Author

**NONFLAMMABLE FLUID AND 8,000 PSI TECHNOLOGY FOR FUTURE AIRCRAFT HYDRAULIC SYSTEMS (22 CFR 125.4 /B/ /13/ APPLICABLE)**

K. E. BINNS, W. B. CAMPBELL (USAF, Wright-Patterson AFB, OH), N. J. PIERCE, and R. E. YOUNG (McDonnell Aircraft Co., St. Louis, MO) SAE, Aerospace Technology Conference and Exposition, Long Beach, CA, Oct. 14-17, 1985. 14 p.
(SAE PAPER 851909)

In the middle 1970s, the Air Force identified significant damage and losses due to noncombat hydraulic fluid fires. As a result of these fires, a search for a nonflammable hydraulic fluid for use in new aircraft was initiated. A nonflammable fluid, chlorotrifluoroethylene, was identified. However, its weight was over 2.2 times heavier than conventional fluid. This paper discusses the system design approaches, component design, and test results of an overall program to establish technology for use of this nonflammable fluid in new aircraft. This includes the tradeoff study results for selection of 8000 psi as the pressure level, design approaches to control water hammer pressures, component and system design and evaluation. The status of ongoing programs for investigating dynamic seals, pumps, and low energy consumption hydraulic concepts is also presented. Author

**A86-38365**

**LIGHTWEIGHT HYDRAULIC SYSTEM TECHNOLOGY - 8000 PSI UPDATE**

W. N. BICKEL (Rockwell International Corp., Columbus, OH) and J. OHLSON (U.S. Navy, Naval Air Development Center, Warminster, PA) SAE, Aerospace Technology Conference and Exposition, Long Beach, CA, Oct. 14-17, 1985. 10 p.
(SAE PAPER 851910)

The use of higher operating pressures (8000 psi) in aircraft fluid systems is examined. The initial development, computer simulation, laboratory testing, and flight testing of the lightweight hydraulic system (LHS) are discussed. The compatibility testing and full-scale A-7E simulator evaluation of the actuators, actuator dynamic rod and piston seals, axial-piston pumps, titanium tubing, and servo valves of the full-scale LHS are described. The reliability, maintainability, and safety of the LHS are evaluated. Cost analysis of the system reveals that operating an aircraft with an 8000 LHS reduces the weight of the system by 30 percent and the volume by 40 percent as compared to the 3000 psi system. I.F.

**A86-38366**

**HYDRAULIC PUMPS FOR HIGH PRESSURE NON-FLAMMABLE FLUIDS**

J. A. HALAT (Vickers, Inc., Jackson, MS) SAE, Aerospace Technology Conference and Exposition, Long Beach, CA, Oct. 14-17, 1985. 11 p.
(SAE PAPER 851911)

Design considerations that 8000-psi and nonflammable fluids have upon an aircraft inline piston hydraulic pump are presented. The influence of the major physical properties of one nonflammable fluid, chlorotrifluoroethylene (CTFE), are discussed as well as the influence of the hydraulic system. Hydraulic pump pressure, based on experience with the U.S. Navy Lightweight Hydraulic System (LHS), can be increased to 8000 psi without encountering major problems. Utilization of CTFE as a hydraulic fluid shows considerable promise. The performance characteristics of an 8000-psi pump are presented. The paper includes a summary of high pressure operating experience. The paper concludes with a summary of the Wright Patterson Air Force Base Contract for three 40-gpm, 8000-psi CTFE pumps. Author

**A86-38367**

**8000 PSI HYDRAULIC SYSTEM SEALS AND MATERIALS TEST PROGRAM - A PROGRESS REPORT**

R. V. FLIPPO (HR Textron, Inc., Valencia, CA) SAE, Aerospace Technology Conference and Exposition, Long Beach, CA, Oct. 14-17, 1985. 18 p.
(SAE PAPER 851913)

Flight control technology for 8000 psi has emerged almost simultaneously with new fire-resistant hydraulic fluids, such as MIL-H-83282 and chlorotrifluoroethylene. A proliferation of industry recommendations has resulted in a wide variety of mechanisms for solving associated actuator design problems, including tighter clearances, special seals, finishes, materials, and many others. As there are few common agreements on the issues, an extensive three-phase test program was undertaken to attempt to corroborate some of these approaches, or to suggest others that may be better or more cost effective. Author

**THE GENERATION OF TIRE CORNERING FORCES IN AIRCRAFT WITH A FREE-SWIVELING NOSE GEAR**
R. H. DAUGHERTY and S. M. STUBBS (NASA, Langley Research Center, Hampton, VA) SAE, Aerospace Technology Conference and Exposition, Long Beach, CA, Oct. 14-17, 1985. 9 p. Previously announced in STAR as N86-11522. refs
(SAE PAPER 851939)

An experimental investigation was conducted to study the effect of various parameters on the cornering forces produced by a rolling aircraft tire installed on a tilted, free-swiveling nose gear. The parameters studied included tilt angle, trial, tire inflation pressure, rake angle, vertical load, and whether or not a twin tire configuration corotates. These parameters were evaluated by measuring the cornering force produced by an aircraft tire installed on the nose gear of a modified vehicle as it was towed slowly. Cornering force coefficient increased with increasing tilt angle. Increasing trial or rake angle decreased the magnitude of the cornering force coefficient. Tire inflation pressure had no effect on the cornering force coefficient. Increasing vertical load decreased the cornering force coefficient. When the tires of a twin tire system rotated independently, the cornering force coefficients were the same as those for the single-tire configuration. When the twin tire system was made to corotate, however, the cornering force coefficients increased significantly. Author

**FURTHER RESULTS OF NATURAL LAMINAR FLOW FLIGHT TEST EXPERIMENTS**
W. H. WENTZ, JR., A. AHMED (Wichita State University, KS), and R. NYENHUIS (Cessna Aircraft Co., Wichita, KS) IN: General aviation aircraft aerodynamics; Proceedings of the General Aviation Aircraft Meeting and Exposition, Wichita, KS, April 16-19, 1985 . Warrendale, PA, Society of Automotive Engineers, Inc., 1985, p. 37-50. refs
(Contract NAG1-104)
(SAE PAPER 850862)

Flight test experiments were conducted to measure the extent and nature of natural laminar flow on a smoothed test region of a swept-wing business jet wing. Surface hot film anemometry and sublimating chemicals were used for transition detection. Surface pressure distributions were measured using pressure belts. Engine noise was monitored by a microphone attached to the wing surface to study possible acoustic effects on stability of the laminar boundary layer. Side-slip conditions were flown to simulate changes in effective wing sweep. Flight instrumentation and ground data analysis techniques and a method for measuring intermittency of turbulence are described. Correlation was obtained between the hot film gage signals and chemicals for transition detection. Cross-flow vortices were observed for some flight conditions. Results of spectral and statistical analysis of the hot film signals for various flight test conditions are presented. Author

**INTERDEPENDENCE OF PARAMETERS IMPORTANT TO THE DESIGN OF SUBSONIC CANARD-CONFIGURED AIRCRAFT**
T. W. FEISTEL (NASA, Ames Research Center, Moffett Field, CA) IN: General aviation aircraft aerodynamics; Proceedings of the General Aviation Aircraft Meeting and Exposition, Wichita, KS, April 16-19, 1985 . Warrendale, PA, Society of Automotive Engineers, Inc., 1985, p. 73-83. refs
(SAE PAPER 850865)

An analysis is made of the interrelationship of the longitudinal parameters important to the aerodynamic design of an efficient canard or tandem wing configuration. It is shown that theoretical configuration span efficiencies substantially greater than one are feasible with the proper choice of parameters. This improvement can translate into significantly increased lift/drag ratios assuming fixed spans. The Prandtl-Munk relationship for induced drag is used as a convenient qualitative guide, with stability and trim criteria superimposed. An 'aspect-ratio ratio' parameter is introduced to aid in optimizing a configuration longitudinally. It is shown that a canard/wing 'aspect-ratio ratio' of approximately 3/2 to 2 is necessary to achieve peak span efficiency for a given span ratio and gap, assuming representative parameters. Author

### AN APPLICATION OF THE CARSON CRUISE OPTIMUM AIRSPEED - A COMPROMISE BETWEEN SPEED AND EFFICIENCY

H. C. SMITH (Pennsylvania State University, University Park) IN: General aviation aircraft aerodynamics; Proceedings of the General Aviation Aircraft Meeting and Exposition, Wichita, KS, April 16-19, 1985 . Warrendale, PA, Society of Automotive Engineers, Inc., 1985, p. 95-99.

(SAE PAPER 850867)

It is well known that, for propeller-driven airplanes, maximum fuel economy occurs at maximum L/D ratio. It has been shown that, while the speed for maximum L/D yields the least fuel consumed per unit of distance, there is also a speed for the least fuel per unit of velocity, essentially, the best compromise between speed and fuel economy. This paper presents a simple method to predict this optimum airspeed in terms of calibrated airspeed. In this form, it is only a function of gross weight and could easily be made available in operating handbooks in the form of two-dimensional charts. It is shown that the optimum airspeeds for the range of normal operating gross weights requires fairly normal cruise power settings. The study further describes a simple, straightforward method of arriving at the relationship of cruise optimum airspeed in terms of maximum L/D speed. Author

### CRASH DYNAMICS OF GENERAL AVIATION AIRCRAFT; PROCEEDINGS OF THE GENERAL AVIATION AIRCRAFT MEETING AND EXPOSITION, WICHITA, KS, APRIL 16-19, 1985

Meeting and Exposition sponsored by SAE. Warrendale, PA, Society of Automotive Engineers, Inc. (SAE SP-622), 1985, 108 p. For individual items see A86-38510 to A86-38514.

(SAE SP-622)

Papers are presented on formulating criteria to increase passenger safety survivability following small aircraft accidents. Consideration is given to the validation of the seat/occupant model for light aircraft, the development of criteria for general aviation seat and restraint system performance, and human response to impact acceleration. Topics discussed include procedures for evaluating aircraft crash floor pulses, crashworthy design considerations for the general aviation seat, design research for the Caravan 1 crew seat, and the development of mechanical components for advanced aircrew seating systems. I.F.

**A86-38513**

### A PROCEDURE TO EVALUATE AIRCRAFT CRASH FLOOR PULSES

G. WITTLIN (Lockheed-California Co., Burbank) IN: Crash dynamics of general aviation aircraft; Proceedings of the General Aviation Aircraft Meeting and Exposition, Wichita, KS, April 16-19, 1985 . Warrendale, PA, Society of Automotive Engineers, Inc., 1985, p. 55-63. refs

(SAE PAPER 850854)

The paper presents a rational method by which aircraft floor pulses can be defined and their effect on the seat-occupant system evaluated by using the pulses to obtain seat test performance data. The results of recent analyses of a transport airplane exposed to a candidate crash scenario along with seat test data are provided. The results of full-scale crash test analyses of general aviation aircraft are also addressed. It is shown that modeling of aircraft to obtain floor responses can produce a wide range of pulse definitions. It is not always obvious which pulse configuration may be more deleterious to the seat or occupant, without a procedure to compare seat-occupant response. Seat-occupant response evaluation requires that a set of test data and performance criteria parameters be established. Using an analytical approach correlated with test data, provides a basis for such an evaluation. A step-by-step procedure is evolved and comparisons of different pulses are illustrated. Author

### PRELIMINARY DESIGN RESEARCH FOR THE CARAVAN 1 CREW SEAT

R. K. RATHGEBER (FAA, Kansas City, KS) and P. E. PARKER (Cessna Aircraft Co., Wichita, KS) IN: Crash dynamics of general aviation aircraft; Proceedings of the General Aviation Aircraft Meeting and Exposition, Wichita, KS, April 16-19, 1985 . Warrendale, PA, Society of Automotive Engineers, Inc., 1985, p. 79-100. refs

(SAE PAPER 850856)

The Cessna Caravan 1 crew seat/restraint system incorporates many new design features. This system is the result of several iterations of development and evaluations using dynamic test procedures. The testing was done at the Protection and Survival Laboratory dynamic impact test track facility of the FAA Civil Aeromedical Institute. The recommendations of the General Aviation Safety Panel influeenced the test procedures and pass/fail criteria for this project. Data from the dynamic tests provided valuable information on features of seat/restraint system design. Author

### COMPOSITES: DESIGN AND MANUFACTURING FOR GENERAL AVIATION AIRCRAFT; PROCEEDINGS OF THE GENERAL AVIATION AIRCRAFT MEETING AND EXPOSITION, WICHITA, KS, APRIL 16-19, 1985

Meeting and Exposition sponsored by SAE. Warrendale, PA, Society of Automotive Engineers, Inc. (SAE SP-623), 1985, 95 p. For individual items see A86-38516 to A86-38523.

(SAE SP-623)

The present conference on the design and manufacturing of general aviation aircraft composite structures considers the design and certification of a composite control surface, the application of photostress methods to study stress concentrations in composite structures, the buckling behavior and pertinent design data of laminated composite triangular plates, and stress concentrations at a rectangular cutout in a buffer strip laminate. Also discussed are the design and use of Kevlar reinforcements in aircraft structures, high producibility composites design, a room temperature-capable and high temperature-capable cementitious tooling and molding material, the use of an electroformed nickel mold for use in the manufacture of composite parts, the structural dynamics of electroimpulse deicing of a Kevlar-reinforced composite leading edge, and large amplitude vibrations of composite plates treated by self-generating functions. O.C.

**A86-38516**

### DESIGN AND CERTIFICATION OF A COMPOSITE CONTROL SURFACE

C. W. SCHNEIDER and D. C. GIBSON (Lockheed-Georgia Co., Marietta) IN: Composites: Design and manufacturing for general aviation aircraft; Proceedings of the General Aviation Aircraft Meeting and Exposition, Wichita, KS, April 16-19, 1985 . Warrendale, PA, Society of Automotive Engineers, Inc., 1985, p. 1-8. refs

(SAE PAPER 850888)

The present graphite/epoxy composite rudder was designed, tested and certified to replace the G-III executive jet's conventional skin-stiffened aluminum structure, achieving a 50 percent increase in acoustic fatigue life with 22-percent weight savings. Full scale testing encompassed both static and flight tests. Attention is given to structural subelements' design details; an innovative rib cap design is employed to yield enhanced fatigue and damage resistance. O.C.

**A86-38520**

**DESIGN AND USE OF KEVLAR IN AIRCRAFT STRUCTURES**

P. R. LANGSTON (Du Pont de Nemours and Co., Textile Fibers Dept., Wilmington, DE) IN: Composites: Design and manufacturing for general aviation aircraft; Proceedings of the General Aviation Aircraft Meeting and Exposition, Wichita, KS, April 16-19, 1985 . Warrendale, PA, Society of Automotive Engineers, Inc., 1985, p. 41-55.

(SAE PAPER 850893)

Kevlar and Nomex can be applied in the design of aircraft primary structures to reduce weight, lower production costs and life cycle costs, reduce structural maintenance requirements, and increase reliability. Attention is given to Kevlar 49 reinforcing fibers; free vibration decay times, fatigue behavior, moisture absorption, honeycomb sandwich construction applications in conjunction with Nomex cores, and use in filament-wound solid laminates. Applications of these structural methods in A310 and B767 airliners, as well as general aviation, helicopter, and advanced military aircraft, are noted. O.C.

**TIME RUNS OUT FOR THE CLOCKWORK COCKPIT**

G. WARWICK Flight International (ISSN 0015-3710), vol. 129, April 26, 1986, p. 30-33.

The concept of an electronic cockpit began with the design of a CRT horizontal situation indicator for the 767, which led to an electronic attitude direction indicator, etc. Further integration and simplification of the displays permitted displacement of the flight engineer. Customer demands for the latest in technology spurred further cockpit automation, along with backup analog displays. Synoptic displays have been developed in order to extend the digital display formats, and retain their simplicity, from two-engine aircraft to four-engine aircraft such as the 747-400 under development. Similar upgrades are being introduced into the MD-80 series of aircraft, which will also carry wind shear alert capabilities. Additionally, the MD-88 will have either LCD or LED displays to replace electromechanical gages for engine instruments and fluids displays. Extensive upgrading of the redundant autopilot for the MD-11 will permit the aircraft to take corrective actions in the event of a malfunction. The success of the autopilot, and the basis for the decision to implement such an innovation, is a function of the long experience of the manufacturer with the aircraft. M.S.K.

**A86-38721#**

**AIRCRAFT WHEEL DESIGN AND PROVING**

S. M. SMITH (Dunlop Aerospace Group, Coventry, England) Tech Air (ISSN 0040-0831), vol. 44, May 1986, p. 1-4.

The critical design parameters of A-frame and bowl-type wheel designs for aircraft landing gear are summarized. Only the bowl-type design permits installation of heavier brakes, at a concommitant weight penalty, for absorption of higher energy loads. Attention is given to stress-strain prediction for the wheel flange which retains the tire, noting that the possibility of multiple wheel failures on modern transport aircraft has led to the requirement that the wheel rim must be capable of bearing the full load of the aircraft. The necessity of regular tire inspections to detect incipient failure conditions is stressed, along with the inclusion of a fusible device in the tires to prevent blowouts by deflating the tires in the event of overheating or overused brakes. Techniques of photostress analysis of the main wheel diaphragms are described, along with factors influencing the design of the bolt/half hub interface. Titanium and aluminum lithium alloys are noted as potential high-strength, lower-weight materials for wheels to replace magnesium and cast aluminum. Finally, tire testing procedures to ensure that tires meet the specified performance parameters are outlined. M.S.K.

**STRUCTURAL ANALYSIS OF THE CONTROLLED IMPACT DEMONSTRATION OF A JET TRANSPORT AIRPLANE**

E. L. FASANELLA (PRC Kentron, Inc., Hampton, VA), E. WIDMAYER (Boeing Commercial Airplane Co., Seattle, WA), and M. P. ROBINSON (NASA, Langley Research Center, Hampton, VA) IN: Structures, Structural Dynamics and Materials Conference, 27th, San Antonio, TX, May 19-21, 1986, Technical Papers. Part 1 . New York, American Institute of Aeronautics and Astronautics, 1986, p. 324-332. refs

(AIAA PAPER 86-0939)

An analytical method has been developed for assessing crash dynamics of large transport aircraft, such as in the NASA Controlled Impact Demonstration (CID) jet crash test on December 1, 1984. The DYCAST nonlinear finite-element computer code was used in a series of progressively more difficult tasks to model complete transport aircraft crashes. Single aircraft frames and fuselage section vertical drop tests were modeled and analyzed to obtain comparisons with experimental data and to develop hybrid element crash springs for use in the large CID model. Predictions of crash and acceleration levels from a symmetric CID model agreed well with data from the CID experiment. I.S.

**EQUIVALENT PLATE ANALYSIS OF AIRCRAFT WING BOX STRUCTURES WITH GENERAL PLANFORM GEOMETRY**

G. L. GILES (NASA, Langley Research Center, Hampton, VA) IN: Structures, Structural Dynamics and Materials Conference, 27th, San Antonio, TX, May 19-21, 1986, Technical Papers. Part 1 . New York, American Institute of Aeronautics and Astronautics, 1986, p. 333-342. refs

(AIAA PAPER 86-0940)

A new equivalent plate analysis formulation is described which is capable of modeling aircraft wing structures with a general planform such as cranked wing boxes. Multiple trapezoidal segments are used to represent such planforms. A Ritz solution technique is used in conjunction with global displacement functions which encompass all the segments. This Ritz solution procedure is implemented efficiently into a computer program so that it can be used by rigorous optimization algorithms for application in early preliminary design. A direct method to interface this structural analysis procedure with aerodynamic programs for use in aeroelastic calculations is described. This equivalent plate analysis procedure is used to calculate the static deflections and stresses and vibration frequencies and modes of an example wing configuration. The numerical results are compared with results from a finite element model of the same configuration to illustrate typical levels of accuracy and computation times resulting from use of this procedure. **OPERATIONAL EXPERIENCE OF U.S. AIR FORCE WITH STRUCTURAL COMPOSITES**

T. F. CHRISTIAN, JR., M. K. STOWERS, W. H. SCHWEINBERG, and G. W. OYLER (USAF, Warner Robins Air Logistics Center, Robins AFB, GA) IN: Structures, Structural Dynamics and Materials Conference, 27th, San Antonio, TX, May 19-21, 1986, Technical Papers. Part 1 . New York, American Institute of Aeronautics and Astronautics, 1986, p. 362-365.

(AIAA PAPER 86-0946)

USAF operational experience with composites as primary structures in fighter, transport, and trainer aircraft is described. The advantages and the problems of maintenance of each structure are discussed. The items discussed include the structures and parts made of boron-epoxy and graphite/epoxy laminates, used as skins in the F-15 and F-16, respectively; graphite/fiberglass monolithic leading wing edges and graphite/epoxy/Kevlar skins in C-141; graphite/epoxy wing tip, aileron trailing edge wedge, main landing gear strut door, and wing rib in T-38; and Kevlar/epoxy skins and intercostals, and graphite-reinforced belly skin panel in C-130. The problems associated with nondestructive inspection and with the effects of moisture were of particular concern in obtaining consistent repairs. I.S.

### INFLUENCE OF FBW - CONTROL LAWS ON STRUCTURAL DESIGN OF MODERN TRANSPORT AIRCRAFT

M. BESCH (Messerschmitt-Boelkow-Blohm GmbH, Hamburg, West Germany) IN: Structures, Structural Dynamics and Materials Conference, 27th, San Antonio, TX, May 19-21, 1986, Technical Papers. Part 1 . New York, American Institute of Aeronautics and Astronautics, 1986, p. 409-420. refs
(AIAA PAPER 86-0953)

The influence of such novel aircraft features as control laws is discussed in the context of an implementation of fly-by-wire and sidestick controller technologies satisfying the FAR/JAR 25.331 Vertical Design Maneuver Requirements. Attention is given to the possibility that pilot-induced oscillation associated with the sidestick controller will lead to horizontal tailplane overloading, in light of study results which compare conventional and control law-incorporating aircraft which employ sidestick controls. O.C.

### EXPERIMENTAL AEROELASTIC BEHAVIOR OF FORWARD SWEPT GRAPHITE/EPOXY WINGS WITH RIGID BODY FREEDOMS

G.-S. CHEN and J. DUGUNDJI (MIT, Cambridge, MA) IN: Structures, Structural Dynamics and Materials Conference, 27th, San Antonio, TX, May 19-21, 1986, Technical Papers. Part 1 . New York, American Institute of Aeronautics and Astronautics, 1986, p. 462-471. refs
(Contract F49620-85-C-0099)
(AIAA PAPER 86-0971)

An analytical and experimental investigation was made of the aeroelastic flutter and divergence behavior of graphite/epoxy forward swept wings with rigid body pitch and plunge freedoms present. A complete, two-sided 30-degree forward swept wing aircraft model was constructed and mounted with low friction bearings in a low speed wind tunnel. Four different ply layup wings could be interchanged on the model, namely, (0 2/90)s, (15 2/0)s, (30 2/0)s, and (-15 2/0)s. Wind tunnel tests of the 'free' flying models revealed body freedom flutter, bending-torsion flutter, and a support dynamic instability which could be eliminated by proper adjustment of the support stiffness. Good agreement with linear theory was found for all the observed instabilities. Additional tests on the models with rigid body pitch only gave lower critical speeds, while tests on the cantilever wings gave higher speeds. The (15 2/0)s wing gave the best tailored aeroelastic behavior. Author

### A STUDY OF CRACKING IN THE PRESSURE BULKHEAD OF A MILITARY TRANSPORT AIRCRAFT

D. R. SHOWERS, T. F. CHRISTIAN, JR., and D. O. HAMMOND, JR. (USAF, Warner Robins Air Logistics Center, Robins AFB, GA) IN: Structures, Structural Dynamics and Materials Conference, 27th, San Antonio, TX, May 19-21, 1986, Technical Papers. Part 1 . New York, American Institute of Aeronautics and Astronautics, 1986, p. 579-584.
(AIAA PAPER 86-0983)

This paper presents an investigation into aft fuselage pressure bulkhead cracking experience by some U.S. Air Force C-141B military transport aircraft during operational service. Following force wide inspection, an extensive finite element modeling effort was conducted to ascertain the stresses present in the bulkhead which caused the cracking. Following this assessment, an evaluation of potential repairs and modifications was also conducted using finite modeling techniques. This paper points out the fact that detailed studies of fuselage structure now are becoming necessary since military aircraft are remaining in operational inventories longer. This means that the gradual accumulation of pressure cycle damage is now becoming apparent, however, well established analysis techniques which have been used for years to evaluate wing structure are quite adequate for this task. All that is required is that attention be paid to fuselage pressure structure as has been done in the past wing and empennage structure. Author

### GENERIC AIRCRAFT GROUND OPERATION SIMULATION

W. S. PI, J. R. YAMANE, and M. J. C. SMITH (Northrop Corp., Aircraft Div., Hawthorne, CA) IN: Structures, Structural Dynamics and Materials Conference, 27th, San Antonio, TX, May 19-21, 1986, Technical Papers. Part 1 . New York, American Institute of Aeronautics and Astronautics, 1986, p. 606-619. refs
(Contract F33615-82-C-3216)
(AIAA PAPER 86-0989)

A generic aircraft ground operation simulation code was developed under an Air Force contract to provide rapid assessment of the structural capabilities of aircraft under various operating modes and surface conditions. The code is capable of predicting the response of aircraft while performing touchdown, taxiing, turning, and braking operations on paved, paved/bomb-damaged repaired, and unpaved yielding soil-surface runways. Analytical models were established for the airframe structure, the landing gear wheel assembly, and various types of landing gears including the cantilever axle, articulated, and fully levered types. Applying the new simulation code, the predicted ground operation results of C-141B, C-130, F-16, and F-4E aircraft correlated favorably with the test data acquired in the Air Force 'HAVE BOUNCE' program. ### A UNIFIED PROCEDURE FOR MEETING POWER-SPECTRAL-DENSITY AND STATISTICAL-DISCRETE-GUST REQUIREMENTS FOR FLIGHT IN TURBULENCE

J. G. JONES (Royal Aircraft Establishment, Farnborough, England) IN: Structures, Structural Dynamics and Materials Conference, 27th, San Antonio, TX, May 19-21, 1986, Technical Papers. Part 1 . New York, American Institute of Aeronautics and Astronautics, 1986, p. 646-652. refs
(AIAA PAPER 86-1011)

The relationship between the power-spectral-density (PSD) and statistical-discrete-gust (SDG) approaches to the analysis and prediction of aircraft response to atmospheric gusts and turbulence is examined in the light of recent studies. In particular, it has been shown that the PSD method can be reformulated and implemented as a variational problem in which the aircraft response is evaluated on the basis of a worst-case analysis to find the associated tuned input pattern, as in the SDG approach. It is thus possible to relate each of the two methods to a common approach in the form of a statistical pattern theory, pointing the way to a possible unified gust specification. V.L.

### REVIEW OF DYNAMIC INFLOW MODELING FOR ROTORCRAFT FLIGHT DYNAMICS

G. H. GAONKAR (Florida Atlantic University, Boca Raton) and D. A. PETERS (Georgia Institute of Technology, Atlanta) IN: Structures, Structural Dynamics and Materials Conference, 27th, San Antonio, TX, May 19-21, 1986, Technical Papers. Part 2 . New York, American Institute of Aeronautics and Astronautics, 1986, p. 89-115. refs
(Contract DAAG29-85-K-0228)
(AIAA PAPER 86-0845)

Dynamic inflow and its influence on some problems of rotorcraft flight dynamics are briefly introduced under transient conditions, as required in flight dynamics. The bases of modeling range from a simple empirical formulation to an involved prescribed-wake, discrete-vortex analysis of a four-bladed rotor. The emphasis is on perturbed linear versions of inflow in matrix form and on the sensitivity of low-frequency stability and response to inflow. However, non-linear versions for use in time-history solutions are presented. Coverage also includes the areas of weakness, controversial notions, and the need for additional test data on rotor-body damping in forward flight for a better appreciation of the developments in modeling dynamic inflow. Author

**APPLICATION OF THE UNSTEADY VORTEX-LATTICE METHOD TO THE NONLINEAR TWO-DEGREE-OF-FREEDOM AEROELASTIC EQUATIONS**

T. W. STRGANAC (NASA, Langley Research Center, Hampton, VA) and D. T. MOOK (Virginia Polytechnic Institute and State University, Blacksburg) IN: Structures, Structural Dynamics and Materials Conference, 27th, San Antonio, TX, May 19-21, 1986, Technical Papers. Part 2 . New York, American Institute of Aeronautics and Astronautics, 1986, p. 201-210. refs
(AIAA PAPER 86-0867)

A means of numerically simulating flutter is established by implementing a predictor-corrector algorithm to solve the equations of motion. Aerodynamic loads are provided by the unsteady vortex lattice method (UVLM). This method is illustrated via the obtainment of stable and unstable responses to initial disturbances in the case of two-degree-of-freedom motion. It was found that for some angles of attack and dynamic pressure, the initial disturbance decays, for others it grows (flutter). When flutter occurs, the solution yields the amplitude and period of the resulting limit cycle. The preliminaray results attest to the feasibility of this method for studying flutter in cases that would be difficult to treat using a classical approach. K.K.

**EFFECTS OF STRUCTURAL NONLINEARITIES ON LIMIT CYCLE RESPONSE OF AERODYNAMIC SURFACES**

R. M. LAURENSON, A. J. HAUENSTEIN, J. L. GUBSER (McDonnell Douglas Astronautics Co., St. Louis, MO), and R. P. BRILEY (Harris Corp., Melbourne, FL) IN: Structures, Structural Dynamics and Materials Conference, 27th, San Antonio, TX, May 19-21, 1986, Technical Papers. Part 2 . New York, American Institute of Aeronautics and Astronautics, 1986, p. 279-292. refs
(Contract F49620-82-C-0043; F49620-84-C-0123)
(AIAA PAPER 86-0899)

An asymptotic expansion approximation technique, developed to predict limit cycle oscillation response for aerodynamic surfaces with discrete structural nonlinearities, is presented. To evaluate the adequacy of this technique, numerical simulation results are employed. Several numerical integration techniques are evaluated on a comparative basis for predicting the limit cycle response of the nonlinear system. Results obtained during this study show that: (1) the use of asymptotic expansion methods improves the prediction of aerodynamics surface limit response; (2) the Runge-Kutta, Shanks, and Adams-Moulton simulation techniques are all appropriate for this class of problems; (3) aerodynamic surfaces with structural nonlinearities are susceptible to limit cycle behavior at dynamic pressures below the linear flutter values; (4) the limit cycle respones is characterized as a constant amplitude motion which is a function of the magnitude of the nonlinearity and the dynamic pressure. K.K.

**A86-38931#**

**USE OF THE FLIGHT SIMULATOR IN PERFORMING AFTI/F-16 AIRPLANE AEROSERVOELASTIC ANALYSIS**

M. G. ALLEN, M. S. REARDON, and F. W. GORDON (General Dynamics Corp., Fort Worth, TX) IN: Structures, Structural Dynamics and Materials Conference, 27th, San Antonio, TX, May 19-21, 1986, Technical Papers. Part 2 . New York, American Institute of Aeronautics and Astronautics, 1986, p. 493-502. Research supported by General Dynamics Corp. and USAF. refs
(AIAA PAPER 86-0957)

Aeroservoelastic analysis of the AFTI/F-16 airplane for the Automated Maneuvering Attack System Phase has been accomplished by using the dedicated flight simulator. Flexible airframe effects were added, externally generated random noise was applied to a selected control surface loop, and the noise and simulator system response were recorded and monitored with a small independent computer. The response was Fourier transformed, plotted, and margins were obtained. The approach avoided the complexities of mathematically modeling and analyzing non-integer multi-rate digital systems because these systems form a part of the simulator. The approach was possible because digital system technology has provided appropriate computing capacity at reasonable cost. Author

**A86-38947#**

**ACCURATE DYNAMIC THEORY FOR SUPERMANEUVERABLE AIRCRAFT WINGS**

G. A. OYIBO (Fairchild Republic Co., Farmingdale, NY) IN: Structures, Structural Dynamics and Materials Conference, 27th, San Antonio, TX, May 19-21, 1986, Technical Papers. Part 2 . New York, American Institute of Aeronautics and Astronautics, 1986, p. 664-671. refs
(Contract F49620-85-C-0090)
(AIAA PAPER 86-1006)

Some dynamic theories that can be used to understand the aeroelastic tailoring mechanism are reviewed. In particular, the accuracy of the St. Venant torsion theory, that is frequently used in aeroelastic analysis, is examined with reference to the effects of the wing aspect ratio and other design parameters. It is shown that ignoring warping arbitrarily using St. Venant's theory can result in errors over 80 percent in analytical results for composite (supermaneuverable) aircraft wings. Accurate modeling of the warping phenomenon is shown to be particularly important for wings with coupling and higher vibration modes. V.L.

**A86-38950#**

**FLUTTER OF WINGS WITH LEADING EDGE CONTROL SURFACES**

R. YURKOVICH (McDonnell Aircraft Co., Saint Louis, MO) IN: Structures, Structural Dynamics and Materials Conference, 27th, San Antonio, TX, May 19-21, 1986, Technical Papers. Part 2 . New York, American Institute of Aeronautics and Astronautics, 1986, p. 693-700. refs
(Contract N00019-75-C-0424)
(AIAA PAPER 86-0897)

During the development of the F/A-18 aircraft, aeroelastic analyses were conducted to determine the flutter and divergence characteristics of the aircraft. These analyses indicated that the flutter and divergence speeds of the clean wing are highly dependent on the rotational stiffness of the leading edge flaps. It was found that the leading edge flap divergence is responsible for a body freedom flutter which is similar to that seen with a forward swept wing. Several methods of including the leading edge flaps in the flutter and vibration analyses were investigated. Finally, the analytical results were confirmed by flutter model testing. Author

**CRASH ENERGY ABSORBING COMPOSITE SUB-FLOOR STRUCTURE**

G. L. FARLEY (NASA, Langley Research Center; U.S. Army, Aerostructures Directorate, Hampton, VA) AIAA, ASME, ASCE, and AHS, Structures, Structural Dynamics, and Materials Conference, 27th, San Antonio, TX, May 19-21, 1986. 10 p. refs
(AIAA PAPER 86-0944)

Static crushing tests were conducted on four different beam concepts; honeycomb sandwich, sine-wave and two integrally stiffened designs. The sine-wave beams, depending upon specimen geometry, has the highest energy absorption potential of the four concepts evaluated. All beam designs produced a progressive crushing mode similar to tube specimens. The energy absorption capability of sine-wave beam specimens were predictable from results of circular cross section tubes. A comparison of energy absorption capability was made between integrally stiffened beams fabricated from graphite/epoxy, Kevlar-49/epoxy and aluminum. The energy absorption capability of the graphite/epoxy integrally stiffened beams exceeded both the Kevlar-49/epoxy and aluminum integrally stiffened beams. The energy absorption potential of composite structures is between five and ten times that of comparable metallic structure. Author

**RESEARCH ON THE TECHNOLOGY OF AN AIRPLANE CONCEPT FOR A STATIONARY HIGH-ALTITUDE RELAY PLATFORM (SHARP)**

J. DELAURIER, B. GAGNON, J. WONG, R. WILLIAMS, and C. HAYBALL (Toronto, University, Canada) (CASI, Annual General Meeting, 32nd, Montreal, Canada, May 27, 28, 1985) Canadian Aeronautics and Space Journal (ISSN 0008-2821), vol. 32, March 1986, p. 5-22. Research supported by the Canadian Department of Communications. refs

A summary is presented of research carried out by the University of Toronto Institute of Aerospace Studies on an aeronautical Stationary High Altitude Relay Platform (SHARP) for telecommunication relay functions. The design goal is a platform that can fly in stationkeeping mode for up to 1 yr at 21 km altitude. The machine requires an automatic flight controller which can respond to atmospheric disturbances with minimum propulsive energy consumption, besides carrying the microwave relay equipment. Studies thus far, including the construction of prototypes, have identified an aircraft with an oversize stabilizer onto which is mounted a lightweight rectenna. A transmitter on the ground can then beam energy to drive the propeller-driven aircraft, which will also carry the relay equipment. Various design alternatives and techniques explored to lower weight and the required engine power, obtain an aerodynamic configuration suitable for stable flight in climb and loiter, and to define an optimized flight profile are described. Test results with prototype SHARP vehicles are provided and discussed in terms of future research directions. M.S.K.

**A86-39565#**

**LOW AIRSPEED ENVELOPE DETERMINATION OF THE CH-139 JET RANGER HELICOPTER**

W. R. JUPP (Department of National Defence, Ottawa, Canada) (CASI, Helicopter Symposium, Montreal, Canada, May 28, 1985) Canadian Aeronautics and Space Journal (ISSN 0008-2821), vol. 32, March 1986, p. 23-33.

The results of engineering trials to determine the low-speed relative-wind limits of the Jet Ranger CH-139 helicopter for training purposes are reported. The low-speed performance was evaluated as a function of the longitudinal center of gravity (CG) and the gross weight (GW), ranging from 107-2300 in. and 2300-2800 lb, respectively. Trials were carried out in hover at wind speeds up to 30 kt. Instrumentation was installed for recording the rotor flap angle, heading, longitudinal and lateral control, fuel consumption and collective position control. The results indicated that the flight envelope is acceptable for training missions. The tests also revealed the worth of monitoring the rotor flapping angle for determining the flight envelope of teetering rotor helicopters. M.S.K.

**A86-39597*** National Aeronautics and Space Administration. Ames Research Center, Moffett Field, Calif.

**RECENT DEVELOPMENTS IN THE DYNAMICS OF ADVANCED ROTOR SYSTEMS. I**

W. JOHNSON (NASA, Ames Research Center, Moffett Field, CA) Vertica (ISSN 0360-5450), vol. 10, no. 1, 1986, p. 73-107. Previously announced in STAR as N85-24320. refs

The problems that were encountered in the dynamics of advanced rotor systems are described. The methods for analyzing these problems are discussed, as are past solutions of the problems. To begin, the basic dynamic problems of rotors are discussed: aeroelastic stability, rotor and airframe loads, and aircraft vibration. Next, advanced topics that are the subject of current research are described: vibration control, dynamic upflow, finite element analyses, and composite materials. Finally, the dynamics of various rotorcraft configurations are considered: hingeless rotors, bearingless rotors, rotors with circulation control, coupled rotor/engine dynamics, articulated rotors, and tilting proprotor aircraft. **SIX-FORCE-FACTOR IDENTIFICATION OF HELICOPTERS**

J. ZHANG (Xian Jiaotong University, Xian, People's Republic of China) and W. LI (Flight Test Research Centre of China, People's Republic of China) Acta Aeronautica et Astronautica Sinica, vol. 7, April 1986, p. 139-147. In Chinese, with abstract in English. refs

Applied loads are calculated using motion equations and measured data of the system's motion parameters. The basic theory for a frequency response function method in load identifications is presented, and the use of random loads for load identification is discussed. The three main aspects involved in the six-force-factor identification of helicopters are described in detail. These are: (1) ground calibration, (2) the measurement of structural response in flight, and (3) the calculation of the six-force-factor. It is noted that dynamic load, static load and fatique test data can be obtained simultaneously. It is concluded that the six-force-factor of helicopters was identified successfully, and that the data obtained can be instrumental in helicopter design. K.K.

**SOME QUANTITATIVE METHODOLOGY FOR COCKPIT DESIGN**

C. BATES, JR. and M. M. VIKMANIA *In* AGARD Guidance-Control-Navigation Automation for Night All-Weather Tactical Operations 10 p Oct. 1985 refs

Avail: NTIS HC A07/MF A01

The rapidly developing technology in sensor systems, microprocessors, artificial intelligence and communication systems has blurred the traditional lines between avionics subsystems and offers new design options for integrating the aircrew into the weapon system. These developments, together with the stressful flight regimes imposed by advanced threat systems and the night-in-weather environment required for survival in air-to-ground attack/interdiction, require new approaches to crew station design. These new design opportunities are limited only by the design tools and data bases available for their execution. A simplified cockpit design process can be summarized as conceptual design, detailed design, and design verification. With the many tools needed to pursue this process the subset involving man/machine interface must provide a decision track quantifying and predicting the impact of design decisions on crew performance. To meet the objective of the full utilization of the weapon system crew, each technology option under consideration for incorporation in the cockpit must be judged with consideration of both mission and human performance. The cockpit design process must be embedded in an adequate human performance data base tailored for use by design personnel and must take full advantage of operational experience. The development of a family of cockpit design tools, together with the required data bases, has been one of the objectives of the Air Force Aerospace Medical Research Laboratory research program. From this program a select set of methods will be described and examples provided. Author

**X-29A TECHNOLOGY DEMONSTRATOR FLIGHT TEST PROGRAM OVERVIEW**

W. J. SEFIC and C. M. MAXWELL May 1986 17 p refs Presented at the ISA Aerospace Industries/Test Measurement Symposium, Seattle, Wash., 5-8 May 1986

(NASA-TM-86809; H-1347; NAS 1.15:86809; ISA-504) Avail: NTIS HC A02/MF A01 CSCL 01C

An overview of the X-29A functional flight program and concept evaluation program is presented, including some of the unique and different preparations for the first flight. Included are a discussion of the many organizational responsibilities and a description of the program management structure for the test team. Also discussed are preflight ground, flight functional envelope expansion, and flight research test objectives and qualitive results to date for both a limited-envelope flight control system and an expanded-envelope system. The aircraft, including the instrumentation system and measurements, is described. In addition, a discussion is included regarding the use of major support facilities, such as ground and flight simulators, the NASA Western Aeronautical Test Range and mission control center, and the Grumman automated telemetry station. An overview of the associated real-time and postflight batch data processing software approaches is presented. The use of hardware-in-the-loop simulation for independent verification and validation and mission planning and practice is discussed. Also included is a description of the flight-readiness review, the airworthiness and flight safety review, work scheduling, technical briefings, and preflight and postflight crew briefings. The configuration control process used on the X-29A program is described, and its relationship to both simulation and aircraft operations is discussed. An X-29A schedule overview is presented with an outline of a proposed follow-on program. Author

A Total Main Rotor Isolation System (TRIS) was analyzed, designed, fabricated, and bench tested for the reduction of main rotor vibration levels transmitted to the helicopter fuselage. The TRIS consists of a six degree-of-freedom passive system using six Liquid Inertia Vibration Eliminator (LIVE) units developed by Bell Helicopter Textron. The objective of the program is to develop a helicopter isolation system that will achieve 90% (or greater) isolation at minimum weight with no degradation in vehicle stability, handling qualities, alignment tolerance, and reliability or maintainability. A new approach for assessing the survivability of aircraft components in nuclear blast and thermal environments is presented in this dissertation. A nonparametric technique is developed for use in calculating the reliability interference integral. This approach eliminates the need for density function identification and parameter estimation. Furthermore, the method can be used without resorting to large-sample random Monte Carlo simulation or propagation of moments. In addition to this, the derived cumulative distribution function using such a technique exactly interpolates the true distribution function at selected points. The method is applied to the problem of aircraft survivability in nuclear blast environments using failure (strength) distributions found in the literature. It is also applied to the case of aircraft survivability in nuclear thermal environments where direct failure data is not available. Inputs to the engineering models involved are treated statistically and the method is used to rigorously determine the statistical nature of the output variables. GRA

The objective of this thesis is to determine to what extent a highly-maneuverable aircraft's overall performance capability is enhanced by thrust-vectoring nozzles. The resulting performance capabilities are compared to a baseline configuration with non-thrust-vectoring nozzles to determine the effects and advantages of thrust vectoring. The results indicate that the use of vectored thrust can significantly increase an aircraft's performance capability in turning flight. The greater the demand on the aircraft in a turning combat scenario, the more the aircraft utilizes its thrust-vectoring capability to complete the task. The results also indicate that the use of vectored thrust in other phases of flight -- such as cruise, acceleration and climb -- only slightly increases an aircraft's performance capability. GRA

**AN ANALYSIS OF THE LIMIT CYCLE OBSERVED IN THE FUNCTIONAL MOCKUP TEST OF THE NAL QSTOL RESEARCH AIRCRAFT**
H. YAMATO, T. UCHIDA, N. OKADA, T. OGAWA, and A. TADA Dec. 1985 56 p In JAPANESE; ENGLISH summary
(NAL-TR-893; ISSN-0389-4010) Avail: NTIS HC A04/MF A01

The quiet STOL research aircraft under development at the National Aerospace Laboratory is equipped with the Stability and Control Augmentation System (SCAS). When the SCAS Pitch CWS mode is engaged in flight simulation tests using the control system functional mockup, a small limit cycle is observed. The method of describing functions is used to analyze this problem, because nonlinearities in the mechanical linkages and the power actuator play an important role in sustaining the limit cycle. To construct a mathematical model of the control system, nonlinear elements are employed so that the model response may accord with functional mockup test results including the frequency response. Through both the test and the analysis, it is shown that the present method is an effective tool for analyzing the limit cycle. And it is also clarified that the limit cycle observed is not so annoying to the pilot and is within the limits of the MIL specifications for sustained oscillations. Author

This study was initiated to assess the feasibility of an eight-passenger, supersonic-cruise long range business jet aircraft that could be converted into a military missile carrying interceptor. The baseline passenger version has a flight crew of two with cabin space for four rows of two passenger seats plus baggage and lavatory room in the aft cabin. The ramp weight is 61,600 pounds with an internal fuel capacity of 30,904 pounds. Utilizing an improved version of a current technology low-bypass ratio turbofan engine, range is 3,622 nautical miles at Mach 2.0 cruise and standard day operating conditions. Balanced field takeoff distance is 6,600 feet and landing distance is 5,170 feet at 44,737 pounds. The passenger section from aft of the flight crew station to the aft pressure bulkhead in the cabin was modified for the interceptor version. Bomb bay type doors were added and volume is sufficient for four advanced air-to-air missiles mounted on a rotary launcher. Missile volume was based on a Phoenix type missile with a weight of 910 pounds per missile for a total payload weight of 3,640 pounds. Structural and equipment weights were adjusted and result in a ramp weight of 63,246 pounds with a fuel load of 30,938 pounds. Based on a typical intercept mission flight profile, the resulting radius is 1,609 nautical miles at a cruise Mach number of 2.0. Author

**DIVERGENCE STUDY OF A HIGH-ASPECT RATIO, FORWARD-SWEPT WING**

S. R. COLE Jun. 1986 10 p Presented at the AIAA 24th Aerospace Sciences Meeting, Reno, Nev., 6-9 Jan. 1986 Previously announced in IAA as A86-19632

(NASA-TM-87682; NAS 1.26:87682) Avail: NTIS HC A02/MF A01 CSCL 01C

An experimental wind-tunnel study to determine the divergence characteristics of a high-aspect ratio, forward-swept wing has been conducted in the NASA Langley Research Center (LaRC) Transonic Dynamics Tunnel (TDT). The rectangular wing used for this study had a panel aspect ratio of 9.16 (lambda = 0 deg.) and the sweep angle could be set at lambda = 0 deg., -15 deg., -30 deg., -45 deg., or -60 deg. A rectangular wing tip shape was tested at each of these sweep angles. In addition, a tip shape parallel to the freestream flow was tested for a wing sweep angle of lambda = -45 deg. The root of the wing was cantilever mounted to the wall of the wind tunnel. Divergence conditions were measured at M = 0.4 for each sweep angle and tip configuration tested. Subcritical response techniques were used to extrapolate to the divergence conditions during the wind-tunnel test. The primary objective of this test was to obtain data which could be used to verify for this configuration the divergence prediction capability of an aeroelastic analysis code. Subsonic lifting surface theory (kernel function) aerodynamics are utilized by this particular code. The analytical predictions of divergence were found to be significantly conservative at all forward sweep angles. At lambda = -45 deg., the analysis was 14 percent conservative. The effect of the two tip shapes on the divergence dynamic pressure was predicted accurately by the analysis. The divergence condition for the tip shape parallel to the flow occurred at a dynamic pressure 14 percent higher than the divergence condition with a rectangular tip shape. Author

**PUTTING HUMANS INTO VIRTUAL SPACE**

T. A. FURNESS, III and D. F. KOCIAN (USAF, Armstrong Aerospace Medical Research Laboratory, Wright-Patterson AFB, OH) IN: Aerospace simulation II; Proceedings of the Second Conference, San Diego, CA, January 23-25, 1986 . San Diego, CA, Society for Computer Simulation, 1986, p. 214-230. refs

Existing computer displays fail to communicate effectively spatial information to humans in a number of piloting, command, control, communication and design applications. These interfaces are further limited by unnatural operator input modes. To solve these problems the concept of a virtual crew station is introduced which is implemented by visual and auditory virtual displays and natural psychomotor controls including voice, head, eye and hand controllers. A virtual space simulator called the Visually-Coupled Airborne Systems Simulator (VCASS) is described. Experimental findings using the VCASS are related, demonstrating the utility, performance and areas of improvement needed for virtual interfaces. Future applications of a virtual terminal are also discussed. Author

**A THERMAL IMAGING PAYLOAD FOR RPV APPLICATIONS**

W. T. MOORE and T. D. WOOLLS (Rank Pullin Controls, Ltd., Leicester, England) IN: Remotely piloted vehicles; International Conference, 5th, Bristol, England, September 9-11, 1985, Proceedings . Bristol, England, University of Bristol, 1985, p. 14.1-14.10. Research supported by the Royal Signals and Radar Establishment.

Attention is given to the design process considerations, adopted features, and prospective performance of an RPV-carried thermal IR imaging payload. The present design employs coaxial polygon optics, whose scan mechanism, corresponding to a 7-cm cube, can provide high performance with 448 lines. Attention is given to such system features as the automation of imager controls, the cryogenic cooling system, the wide angle telescope, and the video channel downlink to a ground station. O.C.

**A86-37341**

**THERMAL ZOOM OPTICS FOR R.P.V. SENSORS**

M. ROBERTS (Pilkington P.E., Ltd., St. Asaph, Wales) IN: Remotely piloted vehicles; International Conference, 5th, Bristol, England, September 9-11, 1985, Supplementary Papers . Bristol, England, University of Bristol, 1985, p. 15.1-15.8. refs

The 8-13 micron thermal IR band offers the advantages of both day and night use; attention is presently given to an IR zoom lens system applicable to RPV sensor payloads in virtue of its compactness. The optical system comprises an IR scanner and afocal telescope optics, by which collimated thermal radiation from the scene is collected by the objective and focused at an intermediate point, from which it is in turn recollimated into the scanner pupil. Switchable optics, optically and mechanically compensated zoom optics, mechanical design, and testing considerations are discussed. O.C.

**A86-37342**

**THE PHOENIX SENSOR TURRET SYSTEM**

A. J. MCQUIGGAN (GEC Avionics, Ltd., Electro Optical Surveillance Div., Basildon, England) IN: Remotely piloted vehicles; International Conference, 5th, Bristol, England, September 9-11, 1985, Supplementary Papers . Bristol, England, University of Bristol, 1985, p. 16.1-16.8.

The Phoenix sensor turret system's design features and operational capabilities are discussed. The Phoenix turreted, stabilized thermal imaging sensor comprises an imager, cryogenic cooling, and processing and stabilization electronics, integrated into a single LRU. This modular design has yielded a survivable and easily maintainable system whose versatility extends to the incorporation of alternative sensors; it is also applicable to RPVs other than Phoenix. Attention is given to the sensor telescope and cryogenic cooling system. O.C.

**A86-37343**

**APPLICATIONS OF SENSOR PAYLOADS**

J. W. JACK (Ferranti Defence Systems, Ltd., Electro-Optics Dept., Edinburgh, Scotland) IN: Remotely piloted vehicles; International Conference, 5th, Bristol, England, September 9-11, 1985, Supplementary Papers . Bristol, England, University of Bristol, 1985, p. 17.1-17.7.

An account is given of the availability and performance capabilities of TV, intensified TV, pyroelectric vidicon, and thermal imaging systems applicable to visible to far-IR sensing tasks aboard RPV platforms. Attention is given to a number of payload configurations which, while conceived to meet a military requirement for the detection and recognition of a military vehicle, are not restricted to military applications. Civilian applications include thermal emission surveys for local governments and industrial concerns, traffic flow pattern surveillance, and pipeline and transmission line surveys. O.C.

**RETROFITTING AVIONICS - CLOSING THE PERFORMANCE 'GENERATION GAP'**

C. R. SPITZER (NASA, Langley Research Center, Hampton, VA) SAE, Aerospace Technology Conference and Exposition, Long Beach, CA, Oct. 14-17, 1985. 7 p. refs
(SAE PAPER 851813)

The retrofitting of advanced avionics to in-service aircraft in order to increase operational safety and flexibility, and reduce operating costs is analyzed. Research in flight management planning and airborne guidance for full-and cost-effective flight is examined. The use of CRTs and thin film electroluminescent displays in aircraft is described. The development of more accurate and reliable fuel gauges using nuclear-based techniques or volumetric measurements to evaluate fluid levels is studied. Advances in airspace systems, such as the Microwave Landing System, and Air Traffic Control Beacon System/Select Mode, the Traffic Advisory and Collision Advance System, and satellite-based communications, navigation, and surveillance are discussed. I.F.

**A86-38345**

**THE INTEGRATED DIGITAL AVIONICS SYSTEM FOR THE F-20 TIGERSHARK**

W. L. SMITH (Northrop Corp., Aircraft Div., Hawthorne, CA) SAE, Aerospace Technology Conference and Exposition, Long Beach, CA, Oct. 14-17, 1985. 16 p.
(SAE PAPER 851850)

Salient features of the avionics system to be discussed include: (1) a federated arrangement of the multiple processors in the system that maximizes mission reliability, (2) integration of the system using a MIL-STD-1553 multiplex data bus that minimizes the effects of changes and growth, and (3) a pilot-friendly cockpit using one head-up and two head-down displays and controls that allow combat with hands on stick and throttle. Author

**AVIONICS SYSTEM ARCHITECTURE FOR BEECHCRAFT STARSHIP 1**

C. A. FENWICK and J. L. SPENCER (Rockwell International Corp., Avionics Group, Cedar Rapids, IA) SAE, Aerospace Technology Conference and Exposition, Long Beach, CA, Oct. 14-17, 1985. 19 p.
(SAE PAPER 851851)

The architectural design of avionics to be used in the Beechcraft Starship 1 aircraft is presented. The avionics system consists of an integrated array of over 70 electronic line replaceable units organized to provide unprecedented levels of functional capability, fault tolerance, and reconfigurability. The digital data communication network connects all avionics and many nonavionics systems, including engine and fuel sensors, through the use of a dual-dual set of data concentrators. As compared with the current avionics equipment, the advanced avionics concept will result in weight and volume reductions, fewer wires and an integrated data network, simplified cockpit operation, and enhanced reliability. **SYNTHETIC REAL-TIME RELIEF DISPLAY ALL-WEATHER AIRBORNE MISSIONS**

J. N. BOTELLA *In* AGARD Guidance-Control-Navigation Automation for Night All-Weather Tactical Operations 4 p Oct. 1985
Avail: NTIS HC A07/MF A01

Within the context of all-weather airborne missions, it is necessary to provide the pilot with information on the external world, even, and particularly when information provided by radar or optronic sensors are failing. The development of altimetric digital data banks prompts investigations to examine the display of synthetic relief in a cockpit. The study of various mass storages shows that a color film has remarkable storage capacities. Altimetric data are stored on a film read by the MERCATOR reader (whose initial function is to read map images). Three-dimensional synthesis algorithms are used and they are provided with the exceptional possibilities enabled by the MERCATOR analysis. The philosophy of this study is to show how a unique product, the map reader MERCATOR, designed to display plane images, is used to perform tridimensional displays of relief. Author

**THE WIDE FIELD HELMET MOUNTED DISPLAY**

J. LARUSSA *In* AGARD Guidance-Control-Navigation Automation for Night All-Weather Tactical Operations 7 p Oct. 1985 refs
Avail: NTIS HC A07/MF A01

The wide field helmet mounted display developed by the Farrand Optical Company, Inc. is described. This display provides the pilot with an instantaneous field of view of 60 deg vertically and 135 deg horizontally. The central field of view consists of an overlap field of 25 deg within which full stereopsis is available. It would appear that a new design which the Farrand Optical Company, Inc. is now in the process of designing for Aerospace Medical Research Laboratory (AMRK) would be applicable for night all weather operations where such data as flight path control, computed weapon projectories, synthetic outside world views, expected and unexpected threats and automatic terrain following paths would be displayed. The parameters that must be considered in designing a wide field helmet mounted display are discussed. Briefly, these parameters are size, weight and balance on the head, brightness of the display and see-through ability of the display. The discussion assumes the use of a one inch, high brightness, high resolution CRT input already developed and operational. Author

**P T A - DESIGN CONSIDERATIONS FOR AN AIRFRAME SYSTEM AND DETAILED DESIGN OF FUEL SUBSYSTEM**
P. SINGH, R. VENKATESH, and A. R. ACHYUTHA RAO (Aeronautical Development Establishment, Bangalore, India) IN: Remotely piloted vehicles; International Conference, 5th, Bristol, England, September 9-11, 1985, Proceedings . Bristol, England, University of Bristol, 1985, p. 12.1-12.15. refs

Pilotless Target Aircraft (PTAs) are turbojet-propelled, high subsonic cruise RPVs that can be used in several consecutive sorties for weapons development and fighter pilot training. Attention is presently given to the design features and performance characteristics of a PTA's fuel subsystems, which employ engine bleed air for pressurization. A detailed anticipation has been made of center-of-gravity shifts under various operational conditions, as well as of fuel system compressor bleed capacities for pressurization over the range of PTA engine rpm values. O.C.

**A86-37344**
**'A FLYWHEEL POWERED RPV LAUNCHER - PUTTING THEORY INTO PRACTICE'**
D. GRIFFIN (Frazer-Nash, Ltd., Kensington-upon-Thames, England) IN: Remotely piloted vehicles; International Conference, 5th, Bristol, England, September 9-11, 1985, Supplementary Papers . Bristol, England, University of Bristol, 1985, p. 23.1-23.9. Research supported by the Ministry of Defence (Procurement Executive).

The present RPV launching system employs an electric motor-accelerated flywheel to store energy, which is then extracted in the form of nearly steady torque by electromagnetic slipping clutches. This torque is applied via high speed capstan and steel cable to a sliding beam which, in turn, carries a trolley with RPV attachment points. The launcher is transported aboard a Land Rover and operates in all weather conditions without smoke or vapor signatures; launch velocity and peak acceleration are adjustable for a range of RPV weights. O.C.

**A86-37345**
**A SPRING IN THE AIR**
T. C. NOTTINGHAM (Admiralty Research Establishment, Portsdown, England) IN: Remotely piloted vehicles; International Conference, 5th, Bristol, England, September 9-11, 1985, Supplementary Papers . Bristol, England, University of Bristol, 1985, p. 24.1-24.7.

Design considerations and a development history are presented for an inexpensive, low technology, spring-based RPV launch system. The choice of a spring was based on the linearity of its response, as well as its excellent fatigue life and imperviousness to atmospheric and temperature conditions. The launcher configuration uses the spring in compression in order to minimize hazards to operators in the event of linkage failure. O.C.

**UNSTEADY FORCES ON COUNTER-ROTATING PROPELLER BLADES**
D. J. LESIEUTRE (Nielsen Engineering and Research, Inc., Mountain View, CA) and J. P. SULLIVAN (Purdue University, West Lafayette, IN) IN: Applied Aerodynamics Conference, 4th, San Diego, CA, June 9-11, 1986, Technical Papers . New York, American Institute of Aeronautics and Astronautics, 1986, p. 229-236. refs
(Contract NSG-3135)
(AIAA PAPER 86-1804)

Unsteady forces experienced by counter-rotating propeller blades are examined in this paper. A fully coupled vortex lattice model of counter-rotation is used to obtain a quasi-steady solution to the propeller loadings, and an unsteady Sears (1941) analysis provides an estimate of the unsteady loads from the quasi-steady results. The vortex lattice method predicts the overall performance of counter-rotation well, based on comparisons of measured and predicted results. The effects of propeller spacing and blade number on the unsteady loadings are investigated. The peak-to-peak variation about the mean of the unsteady loads on the rear propeller varied from 9 percent for a 2 x 2 counter-rotation system to 2 percent for an 8 x 8 system. Author

**PASSIVE CONTROL OF AERODYNAMICALLY FORCED VIBRATIONS OF SUPERSONIC TURBOMACHINE ROTORS BY SPLITTER BLADES**
S. FLEETER, D. A. TOPP (Purdue University, West Lafayette, IN), and D. HOYNIAK (NASA, Lewis Research Center, Cleveland, OH) IN: Structures, Structural Dynamics and Materials Conference, 27th, San Antonio, TX, May 19-21, 1986, Technical Papers. Part 2 . New York, American Institute of Aeronautics and Astronautics, 1986, p. 77-88. NASA-supported research. refs
(AIAA PAPER 86-0844)

An aeroelastic model is developed to examine the use of splitter blades as a passive detuning mechanism for flow induced forced response of unstalled supersonic turbomachine rotors. The splitters introduce aerodynamic and structural detuning to the rotor design. The relationship between aerodynamic and structural detuning and the location and chord lengths of splitters is analyzed. The model is applied to the flow induced response of four 12-blade rotors with Verdon's (1973) Cascade B flow geometry. The data reveal that for gusts characterized by forward and backward traveling waves the splitters generally decrease the maximum amplitudes of response; however, for some gust load interblade phase angles, such as -180 deg and 120 deg the splitters did not reduce the amplitudes of response. I.F.

**THREE DIMENSIONAL UNSTEADY AERODYNAMICS AND AEROELASTIC RESPONSE OF ADVANCED TURBOPROPS**

M. H. WILLIAMS and C.-C. HWANG (Purdue University, West Lafayette, IN) IN: Structures, Structural Dynamics and Materials Conference, 27th, San Antonio, TX, May 19-21, 1986, Technical Papers. Part 2 . New York, American Institute of Aeronautics and Astronautics, 1986, p. 116-124. refs
(Contract NAG3-499)
(AIAA PAPER 86-0846)

A method for the prediction of steady and unsteady aerodynamic loads and aeroelastic response of advanced turboprops is presented. The aerodynamic analysis uses three dimensional unsteady linearized compressible flow theory to compute the blade pressure distribution. The aeroelastic analysis is based on a normal mode representation of the structure. The method is applicable to both conventional and advanced turbo-prop configurations, provided that blade stall and transonic shock waves are not important factors. Aerodynamic results are presented which validate the model in various limits by comparisons to alternative theories and experimental data. Finally, results of a stability analysis of an advanced turboprop are given, with comparisons to measurements made at NASA Lewis Research Center. Author

**DURABILITY PREDICTION OF PARALLEL FUEL TANK SKINS WITH FLUID-STRUCTURE INTERACTION DYNAMICS**

M. A. FERMAN, M. D. HEALEY, W. H. UNGER (McDonnell Aircraft Co., Saint Louis, MO), and M. D. RICHARDSON (USAF, Wright Aeronautical Laboratories, Wright-Patterson AFB, OH) IN: Structures, Structural Dynamics and Materials Conference, 27th, San Antonio, TX, May 19-21, 1986, Technical Papers. Part 2 . New York, American Institute of Aeronautics and Astronautics, 1986, p. 456-463. refs
(AIAA PAPER 86-0935)

Premature fatigue of parallel fuel tank skins due to fluid-structure interaction loading is addressed and is believed to explain some of the widespread leakage of military aircraft. Earlier effort with a single flat panel was extended to parallel panels configured as sides or top/bottom combinations. This expansion of the concept brings it one step closer to a general method where the in-flight and general vibration environments producing this effect can be included along with the manouver spectrum loading in design and application. A combined analytical and experimental approach was used. Author

**AEROELASTIC TAILORING OF ADVANCED COMPOSITE COMPRESSOR BLADES**

O. O. BENDIKSEN and J. F. WHITE, III (Princeton University, NJ) IN: Structures, Structural Dynamics and Materials Conference, 27th, San Antonio, TX, May 19-21, 1986, Technical Papers. Part 2 . New York, American Institute of Aeronautics and Astronautics, 1986, p. 684-692. refs
(AIAA PAPER 86-1008)

An analytical investigation of aeroelastic tailoring concepts for compressor blades is presented. The study is based on a Rayleigh-Ritz formulation with five elastic degrees-of-freedom per blade, including a plate-type mode to account for chordwise bending. A linearized two-dimensional supersonic cascade theory is used to calculate the unsteady aerodynamic forces. The chordwise mode is highly unstable for low aspect ratio composite blades with little or no sweep of the laminate fibers. A moderate aft fiber sweep produces bending-torsion coupling which is stabilizing on the first torsion branch, but which is destabilizing on the first bending branch. Forward fiber sweep is generally destabilizing except on the chordwise branch. By using a crossed-ply laminate configuration, a highly unstable blade section is successfully stabilized up to a Mach number of 1.55. The corresponding titanium blade is unstable for all supersonic Mach numbers. Author

**OFF-DESIGN OPERATION OF TURBOMACHINES [FONCTIONNEMENT HORS ADAPTATION DES TURBOMACHINES]**

V. BENSIMHON (SNECMA; Ecole Nationale Superieure de l'Aeronautique, Paris; Ecole Speciale des Travaux Aeronautiques, Orsay, France) Paris, Masson, 1986, 175 p. In French.

The importance of geometry in the calculation of engine off-design operation and on the various independent parameters determining engine performance is considered in addition to the impact of flight condition or geometry change on performance. A study of engine components is followed by an examination of the advantages and disadvantages of various turbomachines, both in terms of performance and aircraft integration. Aerodynamic, thermal, and mechanical engine component limits are considered in the physical construction of turbomachines such as the single-spool turbojet, double-spool turbojet, double-spool turbofan, and the turbofan. **TEMPERATURE DISTRIBUTION INVESTIGATION AT THE OUTLET OF AN ANNULAR COMBUSTOR OF P TYPE TURBOJET ENGINE**

B. ZHANG (Shenyang Aeronautics Institute, People's Republic of China) Journal of Engineering Thermophysics, vol. 7, Feb. 1986, p. 78-80. In Chinese, with abstract in English.

Some problems of temperature distribution at the outlet of an annular combustor of a P type turbojet engine are described. The change law of maximum temperature, thermal zones, and the stability in the temperature field are demonstrated. The appropriate radial temperature distribution can be obtained by adjusting the mass flow ratio through the inner and outer annular ducts within the range of 0.94-0.96. The effects of supports, tubes, and ignitors on the temperature distribution of the annular combustor are less than that of a can-ring. Author

**SURGE MARGIN ENHANCEMENT BY A POROUS THROAT DIFFUSER**

J. A. RAW (Pratt and Whitney Canada, Inc., Longueil) (CASI, Annual General Meeting, 32nd, Montreal, Canada, May 27, 28, 1985) Canadian Aeronautics and Space Journal (ISSN 0008-2821), vol. 32, March 1986, p. 54-60.

An aerodynamic fix has been devised for the diffuser of a centrifugal compressor to increase the stalling range of the diffuser significantly. The advent of lightweight composite helicopter rotors has reduced the inertia of rotor blades, creating a situation where the rotors can rapidly lose speed. The helicopter engines must therefore be able to accelerate quickly to prevent 'droop' from occurring. The acceleration must be from zero to maximum power in 2 sec, twice as fast as the previous top performance. Previous tests had shown that the surge margin in a compressor diffuser (CD) could be expanded by making the CD walls porous, thereby linking the diffuser throats by a communication manifold, equalizing pressures in the throats and making all diffuser blades reach stall at the same time instead of some before others. The gain in surge margin is sufficient to meet the new acceleration demands at a cost of only one percent of efficiency. The concept is in trials in the PT6 B-36 engine on a Sikorsky S-76 helicopter. Early test results have confirmed the enhanced transient engine response at a negligible efficiency loss. M.S.K.

**GAS AND EROSION CORROSION OF THE COMBUSTION CHAMBERS OF AIRCRAFT ENGINES [GAZOWA I EROZYJNA KOROZJA KOMOR SPALANIA SILNIKOW LOTNICZYCH]**

L. DROZDZ and R. GRUCHALSKI (WSK PZL, Rzeszow, Poland) Technika Lotnicza i Astronautyczna (ISSN 0040-1145), vol. 40, Nov.-Dec. 1985, p. 6, 7. In Polish.

The mechanisms of the gas and erosion corrosion of the turbine blades and combustion chambers of aircraft engines are examined. In particular, attention is given to the effect of vanadium, molybdenum, and sulfur contents in the combustion products on the corrosion of turbine blades of Cr-Ni steels of various compositions; the effect of sulfur on gas corrosion of Cr-Ni steels is shown to be particularly strong. Experimental data on the erosion corrosion of a combustion chamber of EI435 alloy are reported, and photographs of areas damaged by erosion corrosion are presented. V.L.

**THE GENERAL ELECTRIC F404 - ENGINE OF THE RAAF'S NEW FIGHTER**

D. FRITH Jul. 1985 55 p refs

(AD-A164562; ARL-AERO-PROP-TM-426) Avail: NTIS HC A04/MF A01 CSCL 21E

The F404 engine in the F/A-18 is representative of a new generation of military turbofan engines. The features of the engine that govern its performance and contribute to its maintainability are discussed. The intention is to give the non-specialist an appreciation of those factors materially affecting the operation of this type of engine. The RAAF F/A-18 Hornets are powered by two General Electric F404-GE-400 augmented turbofan engines. The 3-stage fan, driven by the low-pressure turbine, compresses inlet air that subsequently divides into the bypass and core flows. Variable inlet guide vanes schedule the direction of the flow into the fan as a function of rotational speed. The core flow is further compressed for entry to the annular combustor by the compressor, driven by the high-pressure turbine. Variable inlet guide and two rows of stators adjust the flow direction as a function of corrected compressor speed. After expansion through the turbines, the high temperature gas from the combustion process is mixed with the bypass air to form the high speed jet out of the exhaust nozzle. When operating in afterburning mode, the speed of this jet is increased by additional combustion in the afterburner. GRA

(NASA-CR-174788; NAS 1.26:174788) Avail: NTIS HC A09/MF A01 CSCL 01A

In recent years, considerable attention has been directed toward improving aircraft fuel consumption. Studies have shown that the high inherent efficiency previously demonstrated by low speed turboprop propulsion systems may now be extended to today's higher speed aircraft if advanced high-speed propeller blades having thin airfoils and aerodynamic sweep are utilized. Hamilton Standard has designed a 9-foot diameter single-rotation Large-Scale Advanced Prop-Fan (LAP) which will be tested on a static test stand, in a high speed wind tunnel and on a research aircraft. The major objective of this testing is to establish the structural integrity of large-scale Prop-Fans of advanced construction in addition to the evaluation of aerodynamic performance and aeroacoustic design. This report describes the operation, design features and actual hardware of the (LAP) Prop-Fan pitch control system. The pitch control system which controls blade angle and propeller speed consists of two separate assemblies. The first is the control unit which provides the hydraulic supply, speed governing and feather function for the system. The second unit is the hydro-mechanical pitch change actuator which directly changes blade angle (pitch) as scheduled by the control. Author

**DESIGNING COMPACT ELECTROMECHANICAL ACTUATORS FOR FLIGHT CONTROL**
J. MABIE (Kollmorgen Corp., Inland Motor Div., Radford, VA) and G. HORNER (Hightech Components, Ltd., Tadley, England) IN: Remotely piloted vehicles; International Conference, 5th, Bristol, England, September 9-11, 1985, Proceedings . Bristol, England, University of Bristol, 1985, p. 13.1-13.6.

The electromechanical actuator described in this paper was designed to be used for primary flight control of a subsonic target drone. The actuator includes a motor, failsafe brake, gearing, dual feedback potentiometer and electronics all contained within a totally sealed housing. The electronics consist of a position servo amplifier with a Pulse Width Modulated power stage as well as filtering to meet stringent Electromagnetic Interference requirements. This paper describes the design process including design choices, analysis and experimental effort expended to ensure that the actuator would go through the battery of qualification tests with minimal complications. **A REAL-TIME SIMULATION OF A NON-LINEAR RPV INCORPORATING HEAD-UP TYPE COLOUR GRAPHICS**
P. P. ASLIN, J. V. HATFIELD, R. J. PATTON (York, University, Heslington, England), and A. J. A. OXTOBY (Hull, University, England) IN: Remotely piloted vehicles; International Conference, 5th, Bristol, England, September 9-11, 1985, Proceedings . Bristol, England, University of Bristol, 1985, p. 21.1-21.13. SERC-supported research. refs

The 'Machan' RPV was designed to serve as an R&D vehicle for the development of flight control laws as well as for surveillance duties. Using comparatively modest computing power, a simulation of the Machan RPV has been developed which allows the assessment of aircraft performance on-line in both open loop and closed loop configurations. The simple control structure obtained furnishes a baseline stability augmentation system, and is used as an inner loop design. O.C.

**DESIGN FEATURES OF AUTOMATIC CONTROL SYSTEM OF D-4 RPV**
W. XIE and B. LIU Northwestern Polytechnical University, Journal, vol. 4, April 1986, p. 217-226. In Chinese, with abstract in English. refs

Design features incorporated into the Chinese D-4 remotely piloted vehicle (RPV) to achieve stable flight and a vertical orientation for the on-board instrumentation are described, along with the results of several aerial surveys with different instruments. Trackkeeping performance of the RPV has reached a 25 m accuracy by equipping the aircraft with a laser range finder and an autopilot. The pitch and bank angles of the platform have been stabilized to 2 deg within the vertical using low-cost components. Installation of an on-board cesium light pump magnetic probe has permitted aeromagnetic prospecting at a scale of 1:10,000. Aerophotogrammetry has been performed at a scale of 1:20,000 for examining soil erosion around the Yellow River. M.S.K.

**PIVOTABLE STRAKES FOR HIGH ANGLE OF ATTACK CONTROL**
P. J. BOBBITT and J. T. FOUGHNER, JR. (NASA, Langley Research Center, Hampton, VA) SAE, Aerospace Technology Conference and Exposition, Long Beach, CA, Oct. 14-17, 1985. 13 p. refs
(SAE PAPER 851821)

A series of pivotable strakes have been tested in combination with a 44-deg swept wing to determine their ability to provide pitch control at high angles of attack. The tests were carried out in the Langley 7 X 10-Foot High-Speed tunnel at nominal Mach numbers of 0.3 to 0.4. A total of five strakes with various aspects ratios and shapes were tested at negative deflection angles of 5, 10, 15, and 20 deg through an angle of attack range up to approximately 50 deg. In addition, a cranked delta wing with 70-deg sweep was tested with two different pivotable apex flaps. This paper shows lift, drag and moment data for the complete configurations as well as for the separate contributions of the strakes and fuselage nose which are mounted on a second balance. Generally, strake deflection was found to have a significant effect on moment while lift/drag changed very little. Author

**APPLICATION OF ANALYTICAL REDUNDANCY**
R. C. HENDRICK (Honeywell, Inc., Minneapolis, MN) SAE, Aerospace Technology Conference and Exposition, Long Beach, CA, Oct. 14-17, 1985. 9 p.
(SAE PAPER 851825)

Analytical redundancy involves the use of diagnostic routines in software to detect a fault in a set of sensor signals. The fault detection algorithms and associated redundancy management structure are presented within. The DIGITAC application improved the mission reliability of existing dual mission-essential sensors by effecting a single-fail-operative capability. Flight safety was preserved for single sensors. Fault detection qualities of the diagnostics were satisfactory. False alarm problems required considerable redesign and tuning to properly model the processes. These problems were satisfactorily solved with the exception of diagnostic errors occurring during extreme turbulence (e.g., penetration of jetwash). Author

### DIGITAC MULTIMODE CONTROL LAWS

R. C. HENDRICK (Honeywell, Inc., Minneapolis, MN) SAE, Aerospace Technology Conference and Exposition, Long Beach, CA, Oct. 14-17, 1985. 12 p.
(SAE PAPER 851826)

The DIGITAC system executes multiple control laws, each tailored to specific mission tasks. The available augmentation modes include the standard control augmentation mode for the A-7D aircraft, a 'flight path' mode, and a 'precision attitude' mode. Synthesis and development of the control laws for these modes are described within this paper. Also described are unique filtering, amplitude sensitive performance, and robust directional control. It was demonstrated that the standard flight modes were executed by the digital system in an un-degraded manner. Major performance improvements were produced for gunnery tasks by the precision attitude mode. Author

### A WIND TUNNEL STUDY OF ACTIVE CONTROL TECHNOLOGY ON A HIGH ASPECT RATIO WING

H. HORIKAWA and K. SAITO (Kawasaki Heavy Industries, Ltd., Aircraft Engineering Div., Kakamigahara, Japan) IN: Structures, Structural Dynamics and Materials Conference, 27th, San Antonio, TX, May 19-21, 1986, Technical Papers. Part 2 . New York, American Institute of Aeronautics and Astronautics, 1986, p. 484-492. Research supported by the Society of Japanese Aerospace Companies. refs
(AIAA PAPER 86-0956)

Gust load alleviation (GLA) and flutter mode control (FMC) of a transport wing have been studied in a low speed wind tunnel. A 1/9 scale semispan wing model, which represents a 150-passenger transport, is mounted in the wind tunnel and controlled by a trailing-edge control surface activated electrically. A gust for the gust load alleviation test is generated through the use of both a fluttering banner and a grid. Digital control utilizing a microcomputer is employed for implementing the flutter mode control. The objectives of this study are the development of a low-budget wind tunnel model with active controls as well as a demonstration of the effectiveness of gust load allevation and flutter mode control on the transport wing. A modified linear quadratic Gaussian (LQG) synthesis procedure has been used to design low-order robust controllers for the flutter mode control. In general, analytical results are in good agreement with experimental ones. Author

### INTEGRATED AEROSERVOELASTIC TAILORING OF LIFTING SURFACES

T. A. ZEILER (PRC-Kentron, Inc., Hampton, VA) and T. A. WEISSHAAR (Purdue University, West Lafayette, IN) IN: Structures, Structural Dynamics and Materials Conference, 27th, San Antonio, TX, May 19-21, 1986, Technical Papers. Part 2 . New York, American Institute of Aeronautics and Astronautics, 1986, p. 654-663. refs
(Contract NAG1-157)
(AIAA PAPER 86-1005)

An approach to the integration of two design activities, structural design and active control design, for a highly idealized aeroservoelastic system is presented. The particular design goal for this study is the maximization of the stable airspeed envelope of an idealized model of an aeroservoelastic system through rational and systematic variation of structural and control design parameters. The steady-state linear quadratic regulator is used to model the control subsystem; the structural subsystem is assigned characteristic design parameters, such as shear center position. The application of the procedure described here produces optimally controlled structures with stability characteristics superior to those of open-loop and initial closed-loop designs. V.L.

### CLASSICAL FLIGHT DYNAMICS OF A VARIABLE FORWARD-SWEEP-WING AIRCRAFT

R. L. SWAIM (Oklahoma State University, Stillwater) and B. A. NEWMAN Journal of Guidance, Control, and Dynamics (ISSN 0731-5090), vol. 9, May-June 1986, p. 352-356. refs

The X-29 advanced technology demonstrator has established the design of forward-sweep wings. A conceivable variation of forward sweep is variable forward sweep. A variable forward-sweep configuration would likely offer higher performance levels than either forward sweep or variable sweep. The classical flight dynamics for such a configuration are determined and discussed. A classical aircraft stability analysis assuming rigid body, linearized dynamics, and no stability augmentation is used. Results indicated variable forward-sweep configurations can have less of a problem with excessive static margins than variable backward-sweep configurations. Wing location and center of gravity location changes due to variable forward sweep affect the stability derivatives consistently more than the wing shape changes due to variable forward sweep. The steady state trim condition and moments of inertia changes due to variable forward sweep and Mach number are small. The phugoid and roll modes experience the largest effects due to variable forward sweep and Mach number. The average handling quality levels experience no drastic changes due to variable forward sweep and Mach number. Author

**THE EQUIVALENT DETERMINISTIC FUNCTION OF THE DRYDEN'S SPECTRA OF ATMOSPHERIC TURBULENCE AND ITS APPLICATION TO THE AIRCRAFT RESPONSE PROBLEM**

Y. XIAO (Beijing Institute of Aeronautics and Astronautics, People's Republic of China) Acta Aeronautica et Astronautica Sinica, vol. 7, April 1986, p. 198-204. In Chinese, with abstract in English.

The equivalent deterministic input technique (EDIT) for multiinput-random processes published recently by Etkin et al. (1984) is reviewed briefly in this paper. Then, a formula of linear transformation is derived and the singularity of the equivalent input function is shown. By analyzing the characteristics of the turbulence spectral matrix for the longitudinal motion of an aircraft, including two gust velocities and one gust gradient, it turns out that only two (rather than three) equivalent input vectors are needed. The Dryden spectra of atmospheric turbulence in current use are decomposed into U11, U22, U33, and the inversed Fourier transform is subsequently performed to obtain the equivalent deterministic function u11, u22, u32 for the reference flight condition. These curves are then fitted by simple expressions. The method and procedure for numerical computation or simulation of the aircraft response to turbulence in the time domain are proposed and discussed. A numerical example is given for comparing the results from the EDIT and the power spectral technique. Author

**DECOUPLING CONTROL SYNTHESIS FOR AN OBLIQUE-WING AIRCRAFT**

G. S. ALAG (University of Western Michigan, Kalamazoo), R. W. KEMPEL, and J. W. PAHLE Jun. 1986 12 p refs Presented at the American Control Conference, Seattle, Wash., 18-20 Jun. 1986

(NASA-TM-86801; H-1339; NAS 1.15:86801) Avail: NTIS HC A02/MF A01 CSCL 01C

Interest in oblique-wing aircraft has surfaced periodically since the 1940's. This concept offers some substantial aerodynamic performance advantages but also has significant aerodynamic and inertial cross-coupling between the aircraft longitudinal and lateral-directional axes. This paper presents a technique for synthesizing a decoupling controller while providing the desired stability augmentation. The proposed synthesis procedure uses the concept of a real model-following control system. Feedforward gains are selected on the assumption that perfect model-following conditions are satisfied. The feedback gains are obtained by using eigensystem assignment, and the aircraft is stabilized by using partial state feedback. The effectiveness of the control laws developed in achieving the desired decoupling is illustrated by application to linearized equations of motion of an oblique-wing aircraft for a given flight condition. **AEROELASTIC CONTROL OF OBLIQUE-WING AIRCRAFT**

J. J. BURKEN, G. S. ALAG, and G. B. GILYARD (University of Western Michigan, Kalamazoo) Jun. 1986 12 p refs Presented at the American Control Conference, Seattle, Wash., 18-20 Jun. 1986

(NASA-TM-86808; H-1346; NAS 1.15:86808) Avail: NTIS HC A02/MF A01 CSCL 01B

The U.S. Navy and NASA are currently involved in the design and development of an unsymmetric-skew-wing aircraft capable of 65 deg wing sweep and flight at Mach 1.6. A generic skew-wing aircraft model was developed for 45 deg wing skew at a flight condition of Mach 0.70 and 3048 m altitude. At this flight condition the aircraft has a wing flutter mode. An active implementable control law was developed using the linear quadratic Gaussian design technique. A method of modal residualization was used to reduce the order of the controller used for flutter suppression. Author

**VALIDATION OF A NEW FLYING QUALITY CRITERION FOR THE LANDING TASK**

D. T. BERRY and S. K. SARRAFIAN 1986 10 p Presented at the AIAA Atmospheric Flight Mechanics Conference, Williamsburg, Va., 18-20 Aug. 1986

(NASA-TM-88261; H-1357; NAS 1.15:88261; AIAA-86-2126-CP) Avail: NTIS HC A02/MF A01 CSCL 01C

A strong correlation has been found to exist between flight path angle peak overshoot and pilot ratings for the landing task. The use of flightpath overshoot as a flying quality metric for landing is validated by correlation with four different in-flight simulation programs and a ground simulation study. Configurations tested were primarily medium-weight generic transports. As a result of good correlation with this extensive data base, criterion boundaries are proposed for landing based on the flight path peak overshoot metric. Author

**STUDY ON USING A DIGITAL RIDE QUALITY AUGMENTATION SYSTEM TO TRIM AN ENGINE-OUT IN A CESSNA 402B**

K. E. DONALDSON 1986 37 p refs

(Contract NAG1-345)

(NASA-CR-177272; NAS 1.26:177272; KU-FRL-6132-3) Avail: NTIS HC A03/MF A01 CSCL 01C

A linear model of the Cessna 402B was used to determine if the control power available to a Ride Quality Augmentation System was adequate to trim an engine-out. Two simulations were completed: one using a steady state model, and the other using a state matrix model. The amount of rudder available was not sufficient in all cases to completely trim the airplane, but it was enough to give the pilot valuable reaction time. The system would be an added measure of safety for only a relatively small amount of development. Author

**FAILURES IN ADVANCED FLIGHT CONTROL SYSTEMS OF FUTURE TRANSPORT AIRCRAFT**

M. F. C. VANGOOL and W. W. RICKARD (McDonnell-Douglas Corp., Long Beach, Calif.) 12 Nov. 1984 187 p refs

(Contract NIVR-1745; RB-RLD-84/83-1.3.1)

(NLR-TR-84108-U; ESA-86-96983) Avail: NTIS HC A09/MF A01

Failure probability and the effects of flight control system failures on handling qualities of a medium-weight transport with reduced stability equipped with a side-stick controlled fly-by-wire flight control system were studied in a flight simulator. A very simple electrical back-up system was used to reduce the pitch divergence when the primary flight control system failed. Results indicate that a large variability in pilot ratings can occur in this kind of investigation. However, analysis of the ratings and the associated

commentary provides a ranking of the configurations used from good to bad. The results are compared to the existing criteria for handling qualities. It is shown that the rankings correlate well with closed-loop performance criterion, and Mil-F-8785 C criteria, whereas other criteria are either not applicable (time history criteria), or inappropriate (static stability criterion, bandwidth criterion).

**A COMPUTER PROGRAMME FOR DATCOM METHODS OF ESTIMATION OF LATERAL STABILITY AND CONTROL DERIVATIVES**
S. RAMABHADRAN and H. SUNDARAMURTHY Mar. 1986 46 p
(NAL-TM-AE-8601) Avail: NTIS HC A03/MF A01

A computer code has been developed to estimate the lateral stability and control derivatives of aircraft configuration. The code, in general, is based on USAF DATCOM methods; in the case of a few derivatives, some approximate relations are used. The code estimates nine important lateral derivatives and five control derivatives. A brief review of the methods along with the limitations of DATCOM are presented. A comparison between the results of the code with those of the working examples of DATCOM are given for some cases. Application of the code for typical configurations is discussed. Author

**HIGHLY MANEUVERABLE AIRCRAFT TECHNOLOGY (HIMAT) FLIGHT-FLUTTER TEST PROGRAM**
M. W. KEHOE May 1984 20 p
(NASA-TM-84907; H-1183; NAS 1.15:84907) Avail: NTIS HC A02/MF A01 CSCL 01C

The highly maneuverable aircraft technology (HiMAT) vehicle was evaluated in a joint NASA and Air Force flight test program. The HiMAT vehicle is a remotely piloted research vehicle. Its design incorporates the use of advanced composite materials in the wings, and canards for aeroelastic tailoring. A flight-flutter test program was conducted to clear a sufficient flight envelope to allow for performance, stability and control, and loads testing. Testing was accomplished with and without flight control-surface dampers. Flutter clearance of the vehicle indicated satisfactory damping and damping trends for the structural modes of the HiMAT vehicle. The data presented include frequency and damping plotted as a function of Mach number. Author

**A86-37176**
**AEROSPACE SIMULATION II; PROCEEDINGS OF THE SECOND CONFERENCE, SAN DIEGO, CA, JANUARY 23-25, 1986**
M. UNG, ED. (Southern California, University, Los Angeles, CA) San Diego, CA, Society for Computer Simulation (Simulation Series. Volume 16, No. 2, 1986), 1986, 304 p. For individual items see A86-37177 to A86-37195.

Papers are presented on techniques for optimizing computer performance in real-time flight simulation; the effects of simulator variation on the fidelity of a UH-60 Black Hawk simulation; a real-time simulation for helicopter rotor wind-tunnel operations; simulation support software in a real-time environment; simulation of auto-rendezvous and docking; a generic missile weapon system model for war-gaming; and the optimal missile nonlinear multiloop controller design principle. Topics discussed include the modeling of a tethered two-body system in space; the testing of a spacecraft attitude control system; Space Station dynamic modeling; interactive mission planning for a Space Shuttle flight experiment; hybrid simulation of ejection seat dynamics, adaptive autoregressive target modes' identification; and optimal control of air-launched homing missiles using realistic performance indices. Consideration is given to flow separation and dynamic stall research, transonic trailing edge flow, fluid dynamics, man/machine interface, computer generated image time delays, the simulation of a satellite attitude control system, and the application of flight simulators to the development of advanced fighter flight control. I.F.

**EFFECTS OF SIMULATOR VARIATIONS ON THE FIDELITY OF A UH-60 BLACK HAWK SIMULATION**
W. B. CLEVELAND (NASA, Ames Research Center, Moffett Field, CA) and A. ATENCIO, JR. (NASA, Ames Research Center; U.S. Army, Aeroflightdynamics Directorate, Moffett Field, CA) IN: Aerospace simulation II; Proceedings of the Second Conference, San Diego, CA, January 23-25, 1986 . San Diego, CA, Society for Computer Simulation, 1986, p. 13-26. refs

The validity of the vertical motion simulator used to simulate the UH-60A Black Hawk helicopter is evaluated. Aircraft simulation of bob-up, hover turn, and dash/quick stop manuevers are compared to actual flight data. The effects of variations in the simulator's visual and motion characteristics on the simulation data are investigated. Data obtained with the nonintrusive parameter identification procedure and optimal control measures are applied to the helicopter math model used for real-time aircraft simulation. Analysis of the model reveals that the simulated aircraft is underdamped, and the changes in the visual reference have the greatest effect on the ability of the pilot to perform the maneuvers. I.F.

**REAL-TIME SIMULATOR FOR HELICOPTER ROTOR WIND-TUNNEL OPERATIONS**
P. D. TALBOT, R. L. PETERSON, and D. R. GRAHAM (NASA, Ames Research Center, Moffett Field, CA) IN: Aerospace simulation II; Proceedings of the Second Conference, San Diego, CA, January 23-25, 1986 . San Diego, CA, Society for Computer Simulation, 1986, p. 27-40.

This paper describes the elements and operation of a simulator that is being used to train operators of the Rotor Test Apparatus (RTA) in the large-scale 40- by 80-Foot Wind Tunnel at Ames Research Center. The simulator, named TUTOR (for Tunnel Utilization Trainer with Operating Rotor) duplicates the controls of the rotor and its dynamic behavior, as well as the wind-tunnel controls. The simulation software uses a preexisting blade-element model of a four-bladed rotor with flapping and lead-lag degrees of freedom. Equations were developed for all hardware and controls of the RTA and of the wind tunnel that are normally required to perform a wind-tunnel test of a helicopter rotor. The simulator hardware consists of consoles designed to have the same appearance and functions as those in the control room of the 40- by 80-Foot Wind Tunnel, allowing input from three operators who normally establish the required operating conditions during a test run. Normal operating procedures can be practiced, as well as simulated emergencies such as rotor power failure. Author

**A NEW COMPRESSED AIR LAUNCHING SYSTEM**
C. I. CAMPBELL (GQ Defence Equipment, Ltd., Goldaming, England) IN: Remotely piloted vehicles; International Conference, 5th, Bristol, England, September 9-11, 1985, Proceedings . Bristol, England, University of Bristol, 1985, p. 25.1-25.15.

Attention is given to the development history, design features and performance capabilities of a pneumatic catapult launching system for RPVs of up to 150 kg. The primary system components of the launcher are a pneumatic charge reservoir, a quick-opening valve, a pneumatic cylinder, a drive piston/carriage assembly, and a buffer. The system operates at less than 10-bar pressures, allowing a range of low cost pneumatic components to be used. O.C.

**DOUGLAS AUTOMATED WEIGHING SYSTEM**
C. R. SOLT, JR. (Douglas Aircraft Co., Long Beach, CA) IN: International Instrumentation Symposium, 31st, San Diego, CA, May 6-9, 1985, Proceedings . Research Triangle Park, NC, Instrumentation Society of America, 1985, p. 485-499.

The Douglas Automated Weighing System (DAWS), a new state-of-the-art system for weighing aircraft, is described. DAWS eliminates tedious manual weight calculations by using a computer. All aircraft data, platform data, load cell data, and setup configurations can be stored on a single disk. A truck provides portability, so that DAWS can be taken to the aircraft rather than vice versa. The DAWS hardware and software are described in this paper. C.D.

**A86-38070**
**A NEW APPROACH TO AUTOMATED GAS TURBINE ENGINE TESTING**
D. A. GRAVES and T. L. BORMAN (General Motors Corp., Allison Gas Turbine Div., Indianapolis, IN) IN: International Instrumentation Symposium, 31st, San Diego, CA, May 6-9, 1985, Proceedings . Research Triangle Park, NC, Instrumentation Society of America, 1985, p. 501-524.

An automated gas turbine engine testing system, Test Stand (TS) 862, for unattended testing is described. The monitor and control system for TS 862 incorporates a Modvue industrial graphics processing system, three Intel single board computers, and a programmable controller. The Modvue system consists of a color monitor for display of engine parameters, and a second color monitor with a touch-sensitive screen for display of critical engine parameters and operator interface with engine testing. The new test system will provide greater safety for the engine by providing automatic engine shutdown. It will also reduce labor costs incurred when the engine cannot be run, by providing a detailed explanation of where the problems have occurred. Schematics and block diagrams are included. I.S.

**A86-38076*** National Aeronautics and Space Administration. Langley Research Center, Hampton, Va.
**NATIONAL TRANSONIC FACILITY MACH NUMER SYSTEM**
F. A. KERN, C. W. KNIGHT, and R. F. ZASIMOWICH (NASA, Langley Research Center, Hampton, VA) IN: International Instrumentation Symposium, 31st, San Diego, CA, May 6-9, 1985, Proceedings . Research Triangle Park, NC, Instrumentation Society of America, 1985, p. 643-652.

The Mach number system for the Langley Research Center's National Transonic Facility was designed to measure pressures to determine Mach number to within + or - 0.002. Nine calibration laboratory type fused quartz gages, four different range gages for the total pressure measurement, and five different range gages for the static pressure measurement were used to satisfy the accuracy requirement over the 103,000-890,000 Pa total pressure range of the tunnel. The system which has been in operation for over 1 year is controlled by a programmable data process controller to select, through the operation of solenoid valves, the proper range fused quartz gage to maximize the measurement accuracy. The pressure gage's analog outputs are digitized by the process controller and transmitted to the main computer for Mach number computation. An automatic two-point on-line calibration of the nine quartz gages is provided using a high accuracy mercury manometer. Author

**INSTRUMENTATION AND TESTING TECHNIQUES IN THE T2 TRANSONIC CRYOGENIC WIND TUNNEL AT THE ONERA/CERT**
J. P. ARCHAMBAUD, A. BLANCHARD, and A. SERAUDIE (ONERA, Centre d'Etudes et de Recherches de Toulouse, France) IN: ICIASF '85 - International Congress on Instrumentation in Aerospace Simulation Facilities, 11th, Stanford, CA, August 26-28, 1985, Record . New York, Institute of Electrical and Electronics Engineers, 1985, p. 9-25. refs

In the T2 transonic wind tunnel considered, unconfined two-dimensional flow is obtained by moving solid top and bottom walls in the context of an iterative process, while the Reynolds number is increased by making use of cryogenic operation. The theoretical and practical principles involved in the employment of 'adaptive walls' are discussed. In a limited test section, unconfined flow around the model is established by controlling wall conditions, taking into account mass flow through slotted walls and changes in the shape of solid walls. Attention is given to control surface, real flow, virtual flow, the inverse mode, the employment of the Green transform with the Prandtl-Glauert rule, an adaptation flowchart, the constructional features of the T2 two-dimensional test section, and test results. Cryogenic models and their equipment are considered along with complementary instrumentation for flow measurements, and the results of measurements and calibrations. G.R.

**A86-38248**
**INSTRUMENTATION AND OTHER ISSUES IN NON-LINEAR DYNAMIC TESTING IN WIND TUNNELS**
E. S. HANFF, S. JENKINS, and A. PRINI (National Research Council of Canada, Ottawa) IN: ICIASF '85 - International Congress on Instrumentation in Aerospace Simulation Facilities, 11th, Stanford, CA, August 26-28, 1985, Record . New York, Institute of Electrical and Electronics Engineers, 1985, p. 200-208. refs

The locally linearized aerodynamic model embodied in the stability derivatives formulation does not appear adequate to deal with severe nonlinear situations, such as encountered in flight at high angles of attack, and Hanff (1985) has proposed an approach for the representation of dynamic nonlinear aerodynamic reactions. The data needed for this approach can be obtained with the aid of an efficient wind-tunnel technique proposed by Hanff (1983). A summary of the principles of the wind-tunnel technique is presented, and an instrumentation system which has been implemented is briefly described. Attention is also given to a dynamic calibrator and its new electronic system, wind-tunnel apparatus, the representation of aerodynamic reactions, and aspects of simulation. G.R.

**A86-38252**
**A HOT AIR TUNNEL FOR BASE BLEED EXPERIMENTATION**
H. V. HATTINGH, D. VAN V. PIENAAR, and L. R. BOSCH (Stellenbosch, University, Republic of South Africa) IN: ICIASF '85 - International Congress on Instrumentation in Aerospace Simulation Facilities, 11th, Stanford, CA, August 26-28, 1985, Record . New York, Institute of Electrical and Electronics Engineers, 1985, p. 233-240. refs

A thorough understanding of base bleed as applied to cannon shells to extend their range was to be obtained. After an evaluation of published information and approaches available to obtain such an understanding, it appeared to be essential to build a wind tunnel in which both the real stagnation pressure and the stagnation temperature could be simulated. On the basis of cost considerations, it was decided to provide a round test section of 150 mm. A range of Mach numbers and temperatures as a function of altitude had to be simulated. The Mach numbers were in the range from 3 (at sea level) to approximately 1 (barely supersonic). Direct heating was provided with the aid of a conduction heater. Attention is given to experimental equipment and experimental program. The relatively small effect of the rotational speed appears surprising. G.R.

**A86-38253**

**WIND TUNNEL FREE-FLIGHT TEST BY A VERTICAL DROP TECHNIQUE AT A HYPERSONIC MACH NUMBER OF 7**

K. HOZUMI (National Aerospace Laboratory, Tokyo, Japan) IN: ICIASF '85 - International Congress on Instrumentation in Aerospace Simulation Facilities, 11th, Stanford, CA, August 26-28, 1985, Record . New York, Institute of Electrical and Electronics Engineers, 1985, p. 241-250. refs

As aerodynamic data obtained in a conventional wind tunnel are affected by the model support system, free-flight techniques are utilized to obtain data free from support-interference effects. An investigation was conducted regarding the practicability of the vertical drop method as a free-flight testing technique under hypersonic flow conditions. It was found that the employment of the considered method in a hypersonic wind tunnel with free-jet main flow provided a very useful and efficient approach to the acquisition of aerodynamic coefficients of bodies in motion having linear or nearly linear aerodynamic characteristics. Attention is given to the wind tunnel, the models, the test procedure, aspects of data reduction, a simulated data study, and a comparison between aerodynamic models. G.R.

**ALPHA JET TRAINING SYSTEM SINGLE AIRCRAFT CONCEPT**

C. A. BARENYI and G. BENATTI (Dornier GmbH, Friedrichshafen, West Germany) SAE, Aerospace Technology Conference and Exposition, Long Beach, CA, Oct. 14-17, 1985. 8 p.
(SAE PAPER 851766)

The Alpha Jet Training System as a single aircraft concept consists of the training management system and media for the following: academics, simulators, and aircraft. It meets or exceeds all requirements for: (1) timely replacement of obsolete training system components, (2) effective and efficient management in the training of individual pilots, and (3) optimum employment of all components of the training system. It significantly lowers pilot training costs and personnel support requirements through the use of computer assisted instruction and procedure devices, the use of a training management system, and a modern high performance training aircraft with state-of-the-art simulators. Author

**A86-38319**

**GROUND TESTING APPROACH FOR THE B-1B BOMBER**

R. A. MORLEY (Teledyne Sprague Engineering, Gardena, CA) SAE, Aerospace Technology Conference and Exposition, Long Beach, CA, Oct. 14-17, 1985. 12 p.
(SAE PAPER 851796)

Existing methods for production ground testing of the B-1B would create an undesirable and cumbersome work environment. The noise generated by the equipment along with hoses, cables and ducts on the floor produce a safety hazard. The information presented here deals with a new approach to meet the aircraft delivery rate requirement. Goals were established and review of existing methods provided the 'stepping stones' to the solution. The use of high technology computer applications is discussed along with the equipment types used on the B-1B bomber. This is the first automated approach to ground testing and checkout of complex aircraft mechanical systems. Author

**LABORATORY SIMULATION OF LANDING GEAR PITCH-PLANE DYNAMICS**

J. J. ENRIGHT (BF Goodrich Co., Aerospace and Defense Div., Akron, OH) SAE, Aerospace Technology Conference and Exposition, Long Beach, CA, Oct. 14-17, 1985. 12 p. refs
(SAE PAPER 851937)

A technique for laboratory dynamometer simulation of landing gear-brake dynamics is discussed. The method was developed as a means of improving certain limitations of conventional dynamometer testing with and without actual strut hardware. The test fixture, the basis for its similitude, assumptions, and design criteria are described. Background includes descriptions of the form and significance of brake-induced vibration and the concept of a critical torque-speed slope as it relates to system stability criteria. Use of this fixture enables the duplication of brake squeal modes otherwise masked by standard dynamometer fixturing. The large linear range of amplitude and damping permit operation in a deliberately unstable condition to verify stability margins. Examples of the application and verification of the technique are included. Author

**EXPERIMENTAL MEASUREMENTS OF HEAT TRANSFER FROM AN ICED SURFACE DURING ARTIFICIAL AND NATURAL CLOUD ICING CONDITIONS**

M. S. KIRBY and R. J. HANSMAN, JR. (MIT, Cambridge, MA) AIAA and ASME, Joint Thermophysics and Heat Transfer Conference, 4th, Boston, MA, June 2-4, 1986. 11 p. FAA-supported research. refs
(Contract NGL-22-009-640; NAG3-666)
(AIAA PAPER 86-1352)

The heat transfer behavior of accreting ice surfaces in natural (flight test) and simulated (wind tunnel) cloud icing conditions have been studied. Observations of wet and dry ice growth regimes as measured by ultrasonic pulse-echo techniques were made. Observed wet and dry ice growth regimes at the stagnation point of a cylinder were compared with those predicted using a quasi steady-state heat balance model. A series of heat transfer coefficients were employed by the model to infer the local heat transfer behavior of the actual ice surfaces. The heat transfer in the stagnation region was generally inferred to be higher in wind tunnel icing tests than in natural, flight, icing conditions. Author

(AD-A164577; AFHRL-TP-85-43) Avail: NTIS HC A02/MF A01 CSCL 14B

The Air Force Human Resources Laboratory/Operations Training Division is developing a visual system for advanced tactical air combat simulators. As part of this work, two light valve video projectors were evaluated on their ability to display small, high-contrast images. The angular size of the smallest detail which could reliably be identified by an observer was determined for the General Electric PJ5155 and Sodern SVS-14 Video Projectors for stationary and moving targets under a variety of conditions. Several observers evaluated the projectors using variations of the stairstep procedure to determine minimum resolvable target size. For almost all conditions, observers were able to recognize smaller targets on the General Electric system than on the Sodern. With targets moving horizontally, however, minimum resolvable target size for the General Electric projector was significantly larger than for targets moving vertically or diagonally at the same speed. A hypothesis for this effect is discussed. Author (GRA)

**ANALYZING THE COST EFFECTIVENESS OF USING FLIGHT SIMULATORS IN THE ISRAELI AIR FORCE M.S. Thesis**
U. ROZEN Dec. 1985 61 p
(AD-A164864) Avail: NTIS HC A04/MF A01 CSCL 05I

During the last decade flight simulators have been increasingly used in the training of Israeli pilots. The increasing cost of a training flying hour, the shrinking training airspace over Israel since 1979, and the high performance standards required of the Israeli Air Force air crews were the accelerator factors in this process. This thesis describes a way to analyze the cost effectiveness of the present mix of flight simulators and flying hours in the training process of the I.A.F. air crews. The jet fighters, helicopters, and transportation communities are used as examples to demonstrate the implementation of the analysis. These examples give the reader a general picture of the cost effectiveness of using flight simulators in the I.A.F. Author (GRA)

**DE-ICING OF THE ALTITUDE WIND TUNNEL TURNING VANES BY ELECTRO-MAGNETIC IMPULSE Final Report**
G. W. ZUMWALT and R. ROSS Mar. 1986 79 p
(Contract NAG3-607)
(NASA-CR-177260; NAS 1.26:177260) Avail: NTIS HC A05/MF A01 CSCL 14B

The Altitude Wind Tunnel at the NASA-Lewis facility is being proposed for a refurbishment and moderization. Two major changes are: (1) the increasing of the test section Mach number to 0.90, and (2) the addition of spray nozzles to provide simulation of flight in icing clouds. Features to be retained are the simulation of atmospheric temperature and pressure to 50,000 foot altitude and provision for full-scale aircraft engine operation by the exhausting of the aircraft combustion gases and ingestion of air to replace that used in combustion. The first change required a re-design of the turning vanes in the two corners downstream of the test section due to the higher Mach number at the corners. The second change threatens the operation of the turning vanes by the expected ice build-up, particulary on the first-corner vanes. De-icing by heat has two drawbacks: (1) an extremely large amount of heat is required, and (2) the melted ice would tend to collect as ice on some other surfaces in the tunnel, namely, the tunnel propellers and the cooling coils. An alternate de-icing method had been under development for three years under NASA-Lewis grants to the Wichita State University. This report describes the electro-impulse de-icing (EIDI) method and the testing work done to assess its applicability to wind tunnel turning vane de-icing. Tests were conducted in the structural dynamics laboratory and in the NASA Icing Research Tunnel. Good ice protection was achieved at lower power consumption and at a wide range of tunnel operations conditions. Recommendations for design and construction of the system for this application of the EIDI method are given. Author

(Contract F08635-84-K-0145)
(AD-A164880; AFESC/ESL-TR-84-42) Avail: NTIS HC A07/MF A01 CSCL 14B

This study reports on the possible use of nondestructive testing equipment to evaluate the potential of reflection cracking in airfield pavements. It also summarizes the state of the art of reflection cracking analysis and methods for controlling reflection cracking. The proposed method of analysis consists of testing portland cement concrete slabs in a curled-up condition at slab centers and slab corners. Increased tensile strains at the bottom of the overlays at slab corners are related to the number of traffic repetitions to predict reflection cracking life. Although the method appears promising, further study is recommended to extend the limited data base presented here and gain added insight into the nature of mechanisms which cause reflection cracking. This technical report develops a complete system for nondestructive testing and evaluation of rigid airfield pavements. An extensvie review of present destructive and nondestructive equipment and methodologies is made to form the basis for selection of the equipment and analytical model used in this research. A brief description of the selected Dynatest Model 8000 Falling Weight Deflectometer (FWD) and the ILLISLAB finite element computer model is presented. Three Air Force installations were chosen for in-depth study of pavement response to FWD loads under a variety of environmental and geological conditions. Techniques are presented to determine the location of maximum damage to rigid pavement slabs for one or any combination of aircraft, and the validity of the calculated stresses is established through comparisons of measured and predicted deflections at joints. Major study findings include: (1) new designations for pavement features based on actual loading conditions, (2) guidelines for planning and conducting large-scale evaluations of major airfield systems, (3) a computer-based determination of E and K, (4) joint behavior prediction under fluctuating temperatures and their effect on generated slab stresses, (5) procedures to account for the annual distribution of traffic over the range of temperatures normally experienced at any facility, and (6) a simplistic means of estimating total past damage from aircraft operations. An air-on demonstration of the Captive Trajectory Support (CTS) system was conducted in the Propulsion Wind Tunnel (16T) on July 21 through July 26, 1985 The test objectives were: (1) to demonstrate the structural integrity of the CTS system; (2) to demonstrate the ability of the CTS system to satisfactorily obtain grid and trajectory generation data for a typical shore model in free stream and relative to a simulated (flat plate) aircraft in a dynamic wind tunnel environment; and (3) to obtain a Mach number calibration for the Tunnel 16T Cart 2 (Multi-Purpose Cart) with the CTS system installed. The 1/4-scale Maximum Volume Bomb (MVB) was used to represent a typical store. Data were obtained at free-stream Mach numbers from 0.3 to 1.6 at stagnation pressures from 400 to 1600 psfa. GRA

(AIAA PAPER 86-0952)

Relative numerical efficiencies of different commonly used optimization techniques for solving problems with multiple constraints have been compared with an aim of developing an efficient optimization method for the automated design of large aerospace structures. A hybrid algorithm using both optimality criteria and mathematical programming methods is suggested. As a result of the study, the CONMIN computer program, and possibly NEWSUIT-A, will be used in conjunction with an optimality criteria algorithm built from OPTSTAT to develop the multidisciplinary hybrid optimization algorithm. **PARTICULATE CONTAMINANT RELOCATION DURING SHUTTLE ASCENT**
J. J. SCIALDONE Jun. 1986 17 p
(NASA-TM-87794; NAS 1.15:87794; REPT-86B0432) Avail: NTIS HC A02/MF A01 CSCL 22B

The dislodgement, venting, and redeposition of particles on a surface in the shuttle bay by the vibroacoustic, gravitational, and aerodynamic forces present during shuttle ascent have been investigated. The particles of different sizes which are displaced, vented, and redistributed have been calculated; and an estimate of the increased number of particles on certain surfaces and the decrease on others has been indicated. The average sizes, velocities, and length of time for certain particles to leave the bay following initial shuttle doors opening and thermal tests have been calculated based on indirect data obtained during several shuttle flights. Suggestions for future measurements and observations to characterize the particulate environment and the techniques to limit the in-orbit particulate contamination of surfaces and environment have been offered. After completion of the first six flights of Space Shuttle Columbia, the four rudder/speedbrake rotary actuators were removed so that a complete disassembly and inspection could be accomplished to evaluate the condition of all internal components. The flight loads experienced by the actuators are compared to those used in designing them. The combination of materials employed for the gear train and lubrication system of the Space Shuttle rudder/speedbrake rotary actuators successfully withstands all stresses and loads encountered during six orbital flights and six years of environmental exposure. Care should be exercised when choosing off-the-shelf or catalog parts (e.g., bearings, rollers, and spacers) to ensure that the same attention to surface protection is exercised as is typically given to custom designed parts. The requirement imposed on this design for operation during 100 missions over a 10 year period can be met as demonstrated by the excellent condition of these units after their flight exposure. ESA

A user's guide for the computer program that calculates the steady-state aerodynamic loads on the Shuttle thermal-protection tiles is presented. The main element in the program is the MITAS-II, Martin Marietta Interactive Thermal Analysis System. The MITAS-II is used to calculate the mass flow in a nine-tile model designed to simulate conditions during a Shuttle flight. The procedures used to execute the program using the MITAS-II software are described. A list of the necessry software and data files along with a brief description of their functions is given. The format of the data file containing the surface pressure data is specified. The interpolation techniques used to calculate the pressure profile over the tile matrix are briefly described. In addition, the output from a sample run is explained. The actual output and the procedure file used to execute the program at NASA Langley Research Center on a CDC CYBER-175 are provided in the appendices. Author

**ENVIRONMENTAL AND ADHESIVE DURABILITY OF ALUMINIUM-POLYMER SYSTEMS PROTECTED WITH ORGANIC CORROSION INHIBITORS**

L. J. MATIENZO, D. K. SHAFFER, W. C. MOSHJIER, and G. D. DAVIS (Martin Marietta Laboratories, Baltimore, MD) Journal of Materials Science (ISSN 0022-2461), vol. 21, May 1986, p. 1601-1608. refs
(Contract N00019-82-C-0439)

The protection of pretreated aluminium against environmental corrosion has been accomplished in varying degrees by incorporating selected organophosphonates and organosilanes on the metal surface. Ionizable phosphonates, such as nitrilo-tris methylene phosphonic acid (NTMP), adsorbed at monolayer concentrations, are effective inhibitors against hydration and are compatible with a nitrile-modified epoxy adhesive material. Aqueous 0.1 vol. pct solution of selected organosilane compounds containing reactive side chains (e.g. epoxy, mercapto) exhibit protection against both hydration corrosion and the action of an aggressive species (Cl) and provide good adhesive bond durability with both nitrile-modified and polyamide (primer) epoxy resin systems. Wedge test results suggest that the curing process (e.g. the percentage crosslinking) of the epoxy-polyamide primer system is not affected by the addition of organosilanes, but may be affected by NTMP. The results of substrate surface characterization, adsorption behavior of applied films, and evaluation of candidate inhibitors by chemical, mechanical, and electrochemical test methods are presented. Mechanisms to explain the observed behavior of the phosphonate and silane systems are discussed. Author

**AVIATION FUELS TECHNOLOGY**

E. GOODGER (Cranfield Institute of Technology, England) and R. VERE Basingstoke, England, Macmillan Publishers, Ltd, 1985, 278 p. refs

Current data on piston and turbine engines and aviation fuels are investigated. The procedures for the production, finishing processes, and storage of aviation gasolines and kerosines are examined. Methods for testing the composition, volatility, fluidity, combustion, corrosion, stability, and contaminants of fuels are discussed. The fuel characteristics within aircraft fuel systems and fuel combustion performance are analyzed. The development of aviation fuel from shale oil, tar, or coal, and the use of liquefied hydrocarbon gases, liquid hydrogen, hydrocarbon oxygenates, or hydrogen-nitrogen compounds as aviation fuel substitutes are studied. The fuels for ultra high performance aircraft and rocket propulsion are described. The application of electric, nuclear, or inertial propulsion, and biofuels to aircraft propulsion systems is proposed. I.F.

**EFFECTS OF SECTION THICKNESS AND ORIENTATION ON CREEP-RUPTURE PROPERTIES OF TWO ADVANCED SINGLE CRYSTAL ALLOYS**

M. DONER and J. A. HECKLER (General Motors Corp., Allison Gas Turbine Div., Indianapolis, IN) SAE, Aerospace Technology Conference and Exposition, Long Beach, CA, Oct. 14-17, 1985. 8 p. Research supported by the General Motors Corp.
(SAE PAPER 851785)

Effects of specimen thickness and orientation on creep and stress-rupture properties of two advanced single crystal alloys were investigated. The alloys were CMSX-3, a derivative of Mar-M247, and a new single crystal alloy, designated 'Alloy X', which is based on modification of IN-792 composition. Section thickness effects were ascertained utilizing four different specimen geometries, including 0.250-in. diameter bars and 0.020-in. thick specimens. The stress-rupture lives of both materials degraded with section thickness at stress levels less than 40,000 lb.sq in. The life degradation was approximately 3X at 20,000 lb/sq in. Investigations into the effects of orientation on stress-rupture properties indicated that, for Alloy X, the 110-oriented specimens suffered a loss of approximately 3X in stress-rupture lives, compared to 001-oriented specimens. On the other hand, essentially no difference was observed in the stress-rupture lives of 001and 110-oriented specimens of CMSX-3 alloy. Time for 1 percent creep was essentially unaffected by section thickness or orientation in both alloys. Author

**SOME ASPECTS OF FLUOROCARBON ELASTOMER COMPATIBILITY WITH GAS TURBINE LUBRICANTS**

J. W. A. PRAGNELL and J. VAN TILBORG (Castrol, Ltd., Pangbourne, England) IN: Aviation gas turbine lubricants - Military and civil aspects: Aviation fuel and lubricants - Performance testing; Proceedings of the Aerospace Technology Conference and Exposition, Long Beach, CA, October 14-17, 1985 . Warrendale, PA, Society of Automotive Engineers, Inc., 1985, p. 33-57.
(SAE PAPER 851799)

Fluorocarbon elastomers in the form of 'O' ring seals, hoses, etc. are widely used in gas turbine engines and hence come into contact with lubricants approved for use in those engines. Reports of oil/fluorocarbon elastomer incompatibility have been made which have required investigation in order to determine why such problems occur. This paper deals with certain aspects of compatibility investigated by traditional test techniques and reveals some of the complexities of the problem. Author

**FORMULATING ADVANCED 4 CENTISTOKE GAS TURBINE OILS - A FEASIBILITY STUDY**

Q. E. THOMPSON and R. E. ZIELINSKI (Monsanto Industrial Chemicals Co., St. Louis, MO) IN: Aviation gas turbine lubricants - Military and civil aspects: Aviation fuel and lubricants - Performance testing; Proceedings of the Aerospace Technology Conference and Exposition, Long Beach, CA, October 14-17, 1985 . Warrendale, PA, Society of Automotive Engineers, Inc., 1985, p. 69-75. refs
(SAE PAPER 851833)

A formulation study has been carried out to assess the feasibility of developing advanced gas turbine lubricants in the viscosity range intermediate between current MIL-L-7808 and MIL-L-23699 lubricants (4 centistokes). Using additive technology developed on advanced MIL-L-27502 oils, several 4-centistoke polyol ester-base stocks have been formulated. Eight of the blends thus far tested have shown good to acceptable performance in the Bearing Rig Test run under MIL-L-27502 conditions. Various other key targets of a proposed new specification have been met or closely approached. Author

### ADVANCED LUBRICANTS FOR AIRCRAFT TURBINE ENGINES

G. A. BEANE, IV (USAF, Aero Propulsion Laboratory, Wright-Patterson AFB, OH), L. J. GSCHWENDER, and C. E. SNYDER, JR. (USAF, Materials Laboratory, Wright-Patterson AFB, OH) IN: Aviation gas turbine lubricants - Military and civil aspects: Aviation fuel and lubricants - Performance testing; Proceedings of the Aerospace Technology Conference and Exposition, Long Beach, CA, October 14-17, 1985 . Warrendale, PA, Society of Automotive Engineers, Inc., 1985, p. 77-94. refs
(SAE PAPER 851834)

An assessment of the performance of oils in Air Force turbine engines and helicopter gear boxes is presented along with predicted performance of current and upgraded military specification oils in advanced and 'growth' engine designs. Data is presented on advanced ester base oils evolving from current research efforts. Future high temperature candidate oils representing the ultimate stability for turbine engines are also discussed. Their use, in most cases, entails engine design considerations to accommodate their unique properties. The advantages and disadvantages of the various classes of synthetic oils for turbine engines are discussed, and deficiencies are identified where additional research programs are needed. Author

### ELECTROCHEMICAL EVALUATION OF CORROSIVITY IN TURBINE ENGINE OILS

L. STALLINGS, P. KENNEDY, N. REBUCK, and V. S. AGARWALA (U.S. Navy, Naval Air Development Center, Warminster, PA) IN: Aviation gas turbine lubricants - Military and civil aspects: Aviation fuel and lubricants - Performance testing; Proceedings of the Aerospace Technology Conference and Exposition, Long Beach, CA, October 14-17, 1985 . Warrendale, PA, Society of Automotive Engineers, Inc., 1985, p. 103-108. refs
(SAE PAPER 851867)

This program involves the study of the factors associated with corrosion in turbine engine bearings. Turbine engine oil (MIL-L-23699) used in naval aircraft was found to absorb in excess of 2500 ppm of water at 25 C and 100 percent RH. A mineral oil will absorb in the range of 400 to 500 ppm. This absorbed water causes bearings lubricated with MIL-L-23699 oil to be susceptible to corrosion. A probe which consists of a series of electrochemical galvanic cells is being used to measure corrosion currents developed in high humidity salt air environments. This probe was developed to measure the corrosivity of the naval shipboard environment. Preliminary corrosion current curves have been developed with a bare probe and a probe coated with MIL-L-23699 turbine oil. Studies will be made with MIL-L-23699 base oil and various additives one at a time to determine the effect of each additive in the fluid on corrosion. Author

### THE INFLUENCE OF ESTERS ON ELASTOMER SEALS

G. VAN DER WAAL (Unichema, Netherlands) IN: Aviation gas turbine lubricants - Military and civil aspects: Aviation fuel and lubricants - Performance testing; Proceedings of the Aerospace Technology Conference and Exposition, Long Beach, CA, October 14-17, 1985 . Warrendale, PA, Society of Automotive Engineers, Inc., 1985, p. 109-114.
(SAE PAPER 851868)

To ensure the flawless performance of gasturbine engines it is essential to have a full understanding of the influence of ester base fluids on elastomers, which are used as seals in these engines. This paper describes the development of a simple model to relate the chemical structure of ester base fluids and elastomer swell properties. It's validity has been checked experimentally using a variety of elastomer seals and lubricant base fluids. This model offers a guideline in the selection of esters for gasturbine engine oils, enabling current or new military and civilian specifications to be met. Author

### DEPOSITION IN GAS TURBINE OIL SYSTEMS. I - ANALYSIS AND CLASSIFICATION

D. G. DOWSE (Rolls-Royce, Ltd., Derby, England), E. JANSTEN (DFVLR, Cologne, West Germany), and K. MAIER (MTU Motoren- und Turbinen-Union Muenchen GmbH, Munich, West Germany) IN: Aviation gas turbine lubricants - Military and civil aspects: Aviation fuel and lubricants - Performance testing; Proceedings of the Aerospace Technology Conference and Exposition, Long Beach, CA, October 14-17, 1985 . Warrendale, PA, Society of Automotive Engineers, Inc., 1985, p. 115-131.
(SAE PAPER 851869)

Synthetic lubricants operating in today's gas turbine engines are often working to their limits in respect to thermal stability. Breakdown of these oils causes the formation of deposits in different areas of the engine oil system. Before action can be taken to minimize the deposition technology by either changes to formulation or design consideration it is important that the true nature of the deposit is examined. The results of an investigation of deposits taken from laboratory tests and engine environments are presented. These studies, conducted in a joint venture by the authors, attempt to characterize and classify the deposits in terms of their physical and chemical nature. Author

**A86-38538**

### THE INFLUENCE OF JFTOT OPERATING PARAMETERS ON THE ASSESSMENT OF FUEL THERMAL STABILITY

D. R. KENDALL and J. S. MILLS (Shell Research, Ltd., Thornton Research Centre, Chester, England) IN: Aviation gas turbine lubricants - Military and civil aspects: Aviation fuel and lubricants - Performance testing; Proceedings of the Aerospace Technology Conference and Exposition, Long Beach, CA, October 14-17, 1985 . Warrendale, PA, Society of Automotive Engineers, Inc., 1985, p. 143-151. refs
(SAE PAPER 851871)

The performance of fuels in the Jet Fuel Thermal Oxidation Tester (JFTOT) has been compared with that in a simulated engine oil cooler. In an attempt to improve the poor correlation found between these tests, a carbon burn-off method has been developed to quantify the extent of deposition in the JFTOT and has been used to examine the influence of JFTOT operating conditions on fuel performance. This has shown that the poor correlation between the tests may be due to the low fuel flow rate and the use of aluminium (rather than stainless steel) test specimens in the standard JFTOT. Author

**A86-38539**

### EVALUATION OF JFTOT TUBE DEPOSITS BY CARBON BURNOFF

G. DATSCHEFSKI (ESSO Research Centre, Abingdon, England) and T. G. R. FARTHING (Rolls-Royce, Ltd., Bristol, England) IN: Aviation gas turbine lubricants - Military and civil aspects: Aviation fuel and lubricants - Performance testing; Proceedings of the Aerospace Technology Conference and Exposition, Long Beach, CA, October 14-17, 1985 . Warrendale, PA, Society of Automotive Engineers, Inc., 1985, p. 153-158. Research supported by the Ministry of Defence (Procurement Executive). refs
(SAE PAPER 851994)

The Jet Fuel Thermal Oxidation Tester (JFTOT) is universally used to measure high temperature stability of aviation turbine fuels, which are pass or fail rated according to the amount of deposit formed on the heater tube, assessed by an optical reflectance method. A new quantitative tube rating method has been developed, in which the weight of deposit is determined by carbon burnoff. When applied to a series of test fuels, reasonable repeatability of results was obtained; it was also found that the magnitude of deposits at a given temperature varied with the type of fuel under test. Author

**INGOT METALLURGY ALUMINUM - LITHIUM ALLOYS FOR AIRCRAFT STRUCTURE**

J. C. EKVALL and D. J. CHELLMAN (Lockheed-California Co., Burbank) IN: Structures, Structural Dynamics and Materials Conference, 27th, San Antonio, TX, May 19-21, 1986, Technical Papers. Part 1 . New York, American Institute of Aeronautics and Astronautics, 1986, p. 203-209. refs
(AIAA PAPER 86-0890)

Material property and structural tests were performed on Lockalite (Al-2.1Li-2.5Cu-1.0Mg-0.13Zr) and two Al-Li-X commercial alloy samples, and the results are compared with the properties of 7075-T6X aluminum. The structural behavior was demonstrated by static tests conducted on tapered lugs, typical of those used in airframe applications. An analysis of failure mode criteria shows potential weight savings of 7 to 17 percent for individual Al-Li aircraft structural components and 9.5 percent for a fighter aircraft. It is concluded that Lockalite represents a suitable replacement for conventional 7075-T6X aluminum alloys. I.S.

**A86-38841#**

**COMPOSITE MATERIAL SERVICE EXPERIENCE ON BOEING COMMERCIAL AIRPLANES**

R. L. COGGESHALL (Boeing Commercial Airplane Co., Seattle, WA) IN: Structures, Structural Dynamics and Materials Conference, 27th, San Antonio, TX, May 19-21, 1986, Technical Papers. Part 1 . New York, American Institute of Aeronautics and Astronautics, 1986, p. 366-369.
(AIAA PAPER 86-0947)

The results of the NASA-sponsored flight evaluation program assessing the serviceability and the repair history of composite structures and parts installed on Boeing commercial aircraft are discussed. Typical composite applications include boron-epoxy foreflaps in B707, the B737 graphite spoiler, and the honeycomb sandwich panel of the B727 elevators. Graphite, Kevlar, and graphite-Kevlar composites are included in all flight control surfaces, fixed panels, and fairings in the B757, B767, and B737-300 latest generation aircraft. Concurrent with the design of these components, inspection, and repair requirements and procedures were developed to cover service-induced damage. I.S.

**A86-38859#**

**EFFECT OF CRACK GROWTH RATE VARIATIONS ON LIFE PREDICTIONS**

R. L. WILKINSON (USAF, Armament Div., Eglin AFB, FL) and R. M. ENGLE, JR. (USAF, Wright Aeronautical Laboratories, Wright-Patterson AFB, OH) IN: Structures, Structural Dynamics and Materials Conference, 27th, San Antonio, TX, May 19-21, 1986, Technical Papers. Part 1 . New York, American Institute of Aeronautics and Astronautics, 1986, p. 551-561. refs
(AIAA PAPER 86-0981)

In this paper, data from sixty-eight panels of 2024-T3 aluminum, all tested to identical conditions, were analyzed using the Walker equation to determine the statistical distribution of the crack growth rate constants, 'C' and 'N'. Using this analysis as a model of material property variation, fifteen combinations of maximum load and sequence were selected, and life predictions were made for each of twelve selections from the material properties distributions. Distributions of crack growth lives were determined, and the mean values were found to agree with a baseline deterministic life prediction within five percent. A regression analysis was also performed to determine life as a function of stress level and 'N' for the entire simulation of 180 trials. Agreement with the mean predicted lives was within 13 percent. Author

**A86-39617**

**FATIGUE BEHAVIOR OF TI-6AL-4V POWDER METALLURGY COMPACTS**

F. H. FROES, S. W. SCHWENKER (USAF, Materials Laboratory, Wright-Patterson AFB, OH), and D. EYLON (Metcut Research Associates, Inc., Metcut-Materials Research Group, Wright-Patterson AFB, OH) IN: 1985 Annual Powder Metallurgy Conference, San Francisco, CA, July 14-17, 1985, Proceedings . Princeton, NJ, Metal Powder Industries Federation, 1986, p. 519-530. refs
(Contract F33615-82-C-5078)

Good fatigue behavior is a major requirement for increased use of PM titanium components in airframe and gas turbine engine applications. The factors necessary to improve fatigue for both blended elemental (BE) and prealloyed (PA) components are discussed. In BE material the primary concern is to lower the level of salt contamination. For PA components, a low level of general contaminants, below the 50 micron level, is required. Recent work on microstructural modification in titanium PM material has resulted in fatigue strength superior to annealed ingot metallurgy products. These microstructure modifications have been achieved by either direct heat treatment or by thermochemical treatment, using hydrogen as a temporary alloying element. Author

**EVALUATION OF THE EFFECTS OF A PLASTIC BEAD PAINT REMOVAL PROCESS ON PROPERTIES OF AIRCRAFT STRUCTURAL MATERIALS Final Report, Oct. 1984 - Aug. 1985**

S. CHILDERS, D. C. WATSON, P. STUMPFF, and J. TIRPAK Dec. 1985 151 p
(AD-A165289; AD-F630715; AFWAL-TR-85-4138) Avail: NTIS HC A08/MF A01 CSCL 11D

An abrasive blasting process using plastic beads has been proposed for removing organic coatings from aircraft surfaces and component parts. During the prototype development of the plastic bead blasting process for paint removal many concerns surfaced relative to the potential effects of the process on metal and composite aircraft structural materials. This evaluation of the plastic bead blasting paint removal showed that it removed protective metal coatings such as aluminum cladding and anodize coatings from aluminum alloys and cadmium plating from steel structure. Surface roughness resulted on clad aluminum alloys. Warpage as a result of surface cold working occurred on unsupported thin skin metal materials. The bond strength of thin skin adhesive bonded structure was not affected. The process is less damaging in fatigue to 7075-T6 aluminum structure blasted at 60 psi nozzle pressure than at 38 psi nozzle pressure. Epoxy/graphite composite structure which was plastic bead blasted showed statistically significant losses in the matrix dominated properties. No significant reductions occurred in the fiber dominated mechanical properties. GRA

**ENGINEERING PROPERTY COMPARISONS FOR 2324-T39 AND 2024-T351 ALUMINUM ALLOY PLATE**

L. SCHRA and W. G. J. THART 19 Mar. 1984 64 p
(Contract NIVR-1906)
(NLR-TR-84021-U; B8576225; ESA-86-96979) Avail: NTIS HC A04/MF A01

Engineering properties of the plate material of aluminum alloy 2324-T39 and alloy 2024-T351 were compared. Tensile strength, fracture toughness, notched fatigue strength, and the resistance to fatigue crack propagation under constant amplitude and flight simulation loading were considered. Significantly higher strength and fracture toughness properties are found for 2324-T39, but the notched fatigue strengths of both alloys are comparable. Fatigue crack propagation resistance of 2324-T39 is slightly better than 2024-T351 under constant amplitude loading, but less resistant under flight simulation loading. The latter result indicates that replacement of 2024-T351 by 2324-T39 in fatigue critical areas is questionable. ESA

**EFFECTS OF CLADDING AND ANODIZING ON FLIGHT SIMULATION FATIGUE OF 2024-T3 AND 7475-T761 ALUMINUM ALLOYS**
R. J. H. WANHILL Jan. 1985 29 p refs
(Contract NIVR-1891)
(NLR-TR-85006-U; B8578427; ESA-86-96984) Avail: NTIS HC A03/MF A01

The effects of cladding and anodizing on flight simulation (gust spectrum) fatigue of notch specimens and riveted lap joints of 2024-T3 and 7475-T761 aluminum alloy sheet were investigated. Stress levels were chosen to provide long life data (100,000 simulated flights) for bare alloy specimens. Cladding and anodizing have very large effects on the fatigue lives. Cladding and anodizing are always detrimental for notched specimens. For lap joints, cladding is detrimental only combined with anodizing. Anodizing is very beneficial for lap joints to be assembled from bare alloy sheets. With equivalent surface treatments 2024-T3 specimens always have longer average fatigue lives than 7475-T761 specimens. ESA

**HIGH-TEMPERATURE LUBRICATION SYSTEMS FOR RING/LINER APPLICATIONS IN ADVANCED HEAT ENGINES Interim Report, Oct. 1984 - Jul. 1985**
M. D. KANAKIA, E. C. OWENS, and M. B. PETERSON Jul. 1985 66 p Prepared in cooperation with Wear Sciences, Inc., Arnold, Md.
(Contract DAAK70-82-C-0001; DAAK70-85-C-0007)
(AD-A164955; BFLRF-189) Avail: NTIS HC A04/MF A01 CSCL 11H

An assessment of tribological requirements in upper cylinder area of advanced high temperature engines was made in terms of critical components and their operating conditions. The ring-liner applications are the most severe since they have high temperature (<800 F) and large number of sliding cycles 10 to the 8th power - 10 to the 10th power. This report explores and evaluates various high temperature tribological systems lubricants, materials and lubricant delivery or supply systems for high temperature ring-liner applications. **IMPACT DAMAGE TO COMPOSITE STRUCTURES**
Feb. 1986 40 p
(AGARD-R-729; ISBN-92-835-1517-X) Avail: NTIS HC A03/MF A01

The impact of ballistic penetrators in fuel filled tanks generates high dynamic pressure loading. This damage process is generally referred to as hydraulic ram. Hydraulic ram in aircraft fuel tanks results in large damage of structural components, which in turn can lead to fuel loss or ingestion into the engines, fire and explosion. To determine the effect of hydraulic ram to an integral fuselage fuel tank with carbon/epoxy skin, a firing program was established. Plane carbon/epoxy plates, bolted to an impact box, were impacted with single cuboid fragments. Different shock-absorbing materials used to reduce hydraulic ram pressures on the impact plate, were investigated to prevent propagation of the shock wave. Multiple fragments were projected against the simulated fuel tank sections with carbon/epoxy skins and sandwich design at a hit density of 25 fragments per square meter. Author

**NONSKID COATING FORMULATIONS Patent Application**
L. W. KRAFT and R. F. BRADY, inventors (to Navy) 22 Jan. 1986 15 p
(AD-D012186; US-PATENT-APPL-SN-621308) Avail: NTIS HC A02/MF A01 CSCL 01E

It is an object of the present invention to provide improved nonskid coating formulations having enhanced impact resistance and resistance to sliding movement thereon by aircraft or other equipment. It is a further object of the invention to provide nonskid coatings which will maintain their adhesion to primed steel after severe impact and thus eliminate the hazards caused by dislodged fragments. Yet another object of the invention is to provide nonskid coatings which are resistant to wear and which provide resistance to sliding throughout their service life by virtue of their coarse textured surface. The nonskid coating formulations of the present invention are comprised of two or more components that contain specified ingredients in specified amounts. The nonskid coating formulation is comprised of the following ingredients, by weight, 3 to 8% amine resins, 7 to 13% epoxy resins, 17 to 22% pigments, fillers, and thickeners, 10 to 20% solvents and 39 to 56% aggregates. (AD-A164532; AFWAL-TR-85-2049) Avail: NTIS HC A08/MF A01 CSCL 21D

Fuel tests, analyses, and analytical method development were conducted on a number of fuels of an experimental nature in conjuction with ongoing Air Force programs for studying fuel combustion behavior, turbine engine design, and other fuel related technologies. Fuels from conventional and alternate sources were studied, as were fuels of the high density missile propellant type. A wide variety of both physical and chemical properties of the fuels were measured and are tabulated. Studies conducted to aid in the solution of operational problems are also reported. GRA

**MULTISTAGE METAL HYDRIDE COMPRESSOR**
L. K. HEUNG 1986 14 p Presented at the Solid Storage Science and Engineering Meeting, Los Alamos, N. Mex., 12 Mar. 1986
(Contract DE-AC09-76SR-00001)
(DE86-001965; DP-MS-85-63; CONF-860345-1) Avail: NTIS HC A02/MF A01

Metal hydride compressors can compress hydrogen to high pressures without using mechanical moving parts. They are particularly suited for tritium applications because they require minimal maintenance. A three-stage metal hydride compressor which can compress hydrogen from 14.7 to 20,000 psia has been demonstrated. The design principle and experimental results are presented. DOE

**HOW US COMPANIES ARE ATTACKING PRODUCTION COSTS**

P. TURK Interavia (ISSN 0020-5168), vol. 41, April 1986, p. 419-423.

A comparative evaluation is made of the manufacturing costs-reduction impact of state-of-the-art aircraft materials and fabrication processes which combine automation with highly flexible process-control software. The techniques in question encompass both organic-matrix composites and novel metallic compositions; many have already been successfully applied in the construction of high performance military aircraft. Attention is given to the 'stealth technology'-related advantages of the novel automated fabrication technologies, and the most consequential characteristics of thermoplastic-matrix composites. O.C.

**THE DYNAMIC INSTABILITY OF PLATE STRUCTURES**

H.-J. LIN and Y.-J. LEE (National Taiwan University, Taipei, Republic of China) Chinese Institute of Engineers, Journal (ISSN 0253-3839), vol. 9, Jan. 1986, p. 59-67. refs

The instability of plate structures subjected to in-plane periodic forces (e.g., buckling of ship decks and flat aircraft structures by winds storms) is analyzed using the finite element method. In the analysis, the mass matrix and the geometric stiffness matrix are introduced, and shear effects are taken into consideration. The eight-node isoparametric plate element and the three-node isoparametric beam element are applied in the analysis of regions of dynamic instability for plate, plate with a hole, stiffened plate, and beam. **VIBRATION TEST AND IDENTIFICATION OF MODAL PARAMETER OF AIRCRAFT WING MODEL**

Z. LI, Q. ZENG, and Z. WU Northwestern Polytechnical University, Journal, vol. 4, April 1986, p. 189-198. In Chinese, with abstract in English. refs

A value of 1 is assumed as the constant term in the denominator polynomial of a curve fitting rational-function polynomial and and employed to perform modal analysis of a scale model wing undergoing flutter. Experimental data were obtained by means of a vibration test featuring periodic, random signal excitation in a low speed wind tunnel. The experimental data were used to derive the frequency response function at 82 nodes. The analysis indicated that the coherence function approaches unity at frequencies near resonance. Sample data are provided from a determination of the vibration modes of two components of the wing model. The modes are shown to be in good agreement with those obtained with finite element method. M.S.K.

**RADAR DATA PROCESSING. VOLUME 2 - ADVANCED TOPICS AND APPLICATIONS**

A. FARINA and F. A. STUDER (Selenia S.p.A., Rome, Italy) Letchworth, England/New York, Research Studies Press, Ltd./John Wiley and Sons, Inc. (Electronic and Electrical Engineering Research Studies: Electronic Circuits and Systems Series, No. 3), 1986, 356 p. refs

The design and implementation of the radar data processing (RDP) theory are discussed. Data processing for netted monostatic and bistatic radar systems and technical problems such as the misalignment between radars and target altitude uncertainty are examined. The organization and display of the data on a computer system are studied. The computer simulation of tracking algorithms for RDP performance evaluation and the application of the simulation technique to monoradar and multiradar tracking algorithms are analyzed. The use of RDP in air-traffic control systems, maritime navigation surveillance, and defense systems is investigated. Computer requirements for the implementation of RDP algorithms are described. I.F.

**COMPARISON OF HOT-WIRE MEASUREMENT TECHNIQUES IN A MACH 3 PILOT QUIET TUNNEL**

F.-J. CHEN (High Technology Corp., Hampton, VA) and I. E. BECKWITH (NASA, Langley Research Center, Hampton, VA) IN: ICIASF '85 - International Congress on Instrumentation in Aerospace Simulation Facilities, 11th, Stanford, CA, August 26-28, 1985, Record . New York, Institute of Electrical and Electronics Engineers, 1985, p. 79-85. refs

Disturbance measurements were made in the free stream of a small Mach 3 quiet tunnel using constant-current and constant-temperature anemometers (CCA and CTA). Data from the two types of instruments are compared in terms of frequency response and normalized rms levels of mass flow fluctuations. The mode-diagram analysis of the CCA data produces reliable results because the frequency response is consistent for a wide range of overheat ratios. However, the mode-diagram results for the CTA data cannot be used due to the rapidly decreasing frequency response with decreasing overheat ratio. Only the mass flow fluctuations at high overheat ratio can be obtained with the CTA system, and they can be as much as 50 percent higher than those from the CCA system. Possible reasons for these measurement differences between the two systems are considered. Author

**DEVELOPMENT OF A TEMPERATURE-COMPENSATED HOT-FILM ANEMOMETER SYSTEM FOR BOUNDARY-LAYER TRANSITION DETECTION ON HIGH-PERFORMANCE AIRCRAFT**

H. R. CHILES and J. B. JOHNSON (NASA, Flight Research Center, Edwards, CA) IN: ICIASF '85 - International Congress on Instrumentation in Aerospace Simulation Facilities, 11th, Stanford, CA, August 26-28, 1985, Record . New York, Institute of Electrical and Electronics Engineers, 1985, p. 86-91. Previously announced in STAR as N85-33121.

A hot-film constant-temperature anemometer (CTA) system was flight-tested and evaluated as a candidate sensor for determining boundary-layer transition on high-performance aircraft. The hot-film gage withstood an extreme flow environment characterized by shock waves and high dynamic pressures, although sensitivity to the local total temperature with the CTA indicated the need for some form of temperature compensation. A temperature-compensation scheme was developed and two CTAs were modified and flight-tested on the F-104/Flight Test Fixture (FTF) facility at a variety of Mach numbers and altitudes, ranging from 0.4 to 1.8 and 5,000 to 40,000 ft respectively. **PULSED LASER LIGHT SHEET FLOW VISUALIZATION**

D. C. SOREIDE, G. D. DOUGLAS, and W. P. BRANDT (Boeing Commercial Airplane Co., Seattle, WA) IN: ICIASF '85 - International Congress on Instrumentation in Aerospace Simulation Facilities, 11th, Stanford, CA, August 26-28, 1985, Record . New York, Institute of Electrical and Electronics Engineers, 1985, p. 100-105.

A pulsed ruby laser was used as light source for a set of flow visualization tests involving two test situations. In both cases, the conducted investigation was concerned with the location of the tip vortex of the rotor-blade of a helicopter, giving particular attention to the position relative to the following blade. The optical system employed is considered along with the electronics system, the setup equipment, and the helicopter test. Vortex field maps are provided for the case in which the helicopter rotor vortex field phase angle equals 0 degrees and for the case in which this angle equals 90 degrees. G.R.

### FABRICATION OF CERAMIC COMPONENTS FOR ADVANCED GAS TURBINE ENGINES

F. LIU and E. SOLIDUM (AiResearch Casting Co., Torrance, CA) SAE, Aerospace Technology Conference and Exposition, Long Beach, CA, Oct. 14-17, 1985. 12 p. DOE sponsored research. refs
(Contract DEN3-167)
(SAE PAPER 851786)

The AGT101 ceramic gas turbine engine feasibility study has made use of the slip casting of silicon or silicon nitride powders to produce either reaction-bonded or sintered components such as turbine rotors, turbine shrouds, and inner and outer diffusers. Attention is given to the effects of processing parameters on the microstructure and properties of the finished components; the parameters encompass powder particle size distribution, casting slip viscosity, pH, and solid content fraction. The green slip cast components were consolidated by nitriding, sintering, or sinter/HIPping. O.C.

### PROCESS FOR ADHESIVE BONDING OF METAL SKINS TO AIRCRAFT STRUCTURES

P. M. PHILLIPS (Murdock Engineering Co., Irving, TX) and S. C. AKER SAE, Aerospace Technology Conference and Exposition, Long Beach, CA, Oct. 14-17, 1985. 9 p. refs
(SAE PAPER 851805)

A manufacturing process for the production of an adhesive bonded wet wing structure is described. The process involves: (1) the development of a laminated wing skins with bonded stringers subassembly; (2) the development of laminated skin to spar and rib subassembly; and (3) the bonding of the upper and lower skins. The advantages of bonded structures, which include lower weight, longer service life, and lower maintenance costs, are discussed. The surface preparation, adhesive films, and quality control for wing bonded structures are examined. The cost-effectiveness of bonded structures is analyzed. I.F.

### THE DESIGN OF REPAIRABLE ADVANCED COMPOSITE STRUCTURES

L. J. HART-SMITH (Douglas Aircraft Co., Long Beach, CA) SAE, Aerospace Technology Conference and Exposition, Long Beach, CA, Oct. 14-17, 1985. 17 p. refs
(Contract NAS1-11234; NAS1-13172; NAS1-16857; F33615-79-C-3212; F33615-80-C-5092)
(SAE PAPER 851830)

This paper addresses the repair of advanced composite structures by mechanical fasteners or by adhesive bonding. It is shown that many of today's composite designs are unreasonably difficult to repair. Conversely, the knowledge to design repairable structures is already available, if only it is applied during the initial design stage. Bolted or riveted repairs require only the avoidance of extremely orthotropic composite fiber patterns; those near the quasi-isotropic layup are the most suitable. Mildly orthotropic fiber patterns are appropriate for structures in which there is a dominant load direction. Thick composite structures are shown to require bolted or riveted repairs while thin structures favor adhesively bonded permanent repairs, although provisions can be easily made for temporary mechanical repairs. The reasons why integrally stiffened cocured composite designs are usually impractical to repair are explained and alternative repairable design concepts are presented. Author

**A86-38358**

### WAKE IMAGING SYSTEM APPLICATIONS AT THE BOEING AERODYNAMICS LABORATORY

O. P. CROWDER (Boeing Commercial Airplane Co., Seattle, WA) SAE, Aerospace Technology Conference and Exposition, Long Beach, CA, Oct. 14-17, 1985. 17 p. refs
(SAE PAPER 851895)

The wake imaging system (WIS) for rapid mappings of wind-tunnel model flowfields is described and a summary of recent results is presented. Three different types of systems are discussed. These are: (1) photographic WIS in low-speed wind tunnels, (2) computer graphics WIS in transonic wind tunnels, and (3) flying-strut traverser for large low-speed wind tunnels. In addition, progress toward developing a low intrusive WIS for high-pressure transonic wind tunnels and for flight test applications is described. Author

### A CEMENTITIOUS TOOLING/MOLDING MATERIAL - ROOM TEMPERATURE CASTABLE, HIGH TEMPERATURE CAPABLE

S. WISE and S. KUO IN: Composites: Design and manufacturing for general aviation aircraft; Proceedings of the General Aviation Aircraft Meeting and Exposition, Wichita, KS, April 16-19, 1985 . Warrendale, PA, Society of Automotive Engineers, Inc., 1985, p. 61-66.
(SAE PAPER 850904)

Dash 47R is a cementitious composite initially formulated for use as an autoclave molding/tooling material. A unique matrix and aggregate system imparts unusually high strength and excellent vacuum integrity to DASH 47 at moderately high temperatures even though DASH 47 molds are cast at ambient temperature over commonly used pattern materials. This paper reviews the formulation and properties of DASH 47, and outlines its fabrication method and curing schedule for thin-shelled autoclave tools. In addition, examples of other molding applications for DASH 47 are shown in this paper. Author

**A86-38523**

### GENERATION OF AN ELECTROFORMED NICKEL MOLD FOR USE IN MANUFACTURING COMPOSITE PARTS

D. L. SHELDON IN: Composites: Design and manufacturing for general aviation aircraft; Proceedings of the General Aviation Aircraft Meeting and Exposition, Wichita, KS, April 16-19, 1985 . Warrendale, PA, Society of Automotive Engineers, Inc., 1985, p. 67-69.
(SAE PAPER 850905)

Attention is given to the fabrication of electroformed nickel tools for use in the manufacture of composite parts, as well as the techniques used in the development of tools of this type. The method involves the electrodeposition of a metal onto a cathodic mandrel; the electrode is connected to a positive pole, while the mandrel is connected to the negative pole of a dc source. Two molds have been formed in this way for the wings of the AV-8B Harrier VTOL aircraft, representing the upper and lower wing contours. O.C.

### AVIATION GAS TURBINE LUBRICANTS - MILITARY AND CIVIL ASPECTS: AVIATION FUEL AND LUBRICANTS - PERFORMANCE TESTING; PROCEEDINGS OF THE AEROSPACE TECHNOLOGY CONFERENCE AND EXPOSITION, LONG BEACH, CA, OCTOBER 14-17, 1985

Conference and Exposition sponsored by SAE. Warrendale, PA, Society of Automotive Engineers, Inc. (SAE SP-633), 1985, 163 p. For individual items see A86-38527 to A86-38539.
(SAE SP-633)

Research and development programs in the areas of gas turbine lubricants for civil and military aviation and the performance testing of aviation gas turbine fuels and lubricants are discussed. The topics addressed include: laboratory and field evaluation of a high temperature jet engine oil, performance advantages of high load aviation lubricants, fluorocarbon elastomer compatibility with gas turbine lubricants, potential benefits in the development of a dedicated helicopter transmission lubricant, and feasibility of formulating advanced four centistoke gas turbine oils. Also covered are: advanced lubricants for aircraft turbine engines, future trends for U.S. Naval aviation propulsion system lubricants, electrochemical evaluation of corrosivity in turbine engine oils, the influence of esters on elastomer seals, deposition in gas turbine oil systems, development of the portable water separometer for the WSIM test, influence of JFTOT operating parameters on the assessment of fuel thermal stability, and evaluation of JFTOT tube deposits by carbon burnoff. C.D.

**A86-38527**

### DEVELOPMENT OF A HIGH TEMPERATURE JET ENGINE OIL - LABORATORY AND FIELD EVALUATION

H. L. HEPPLEWHITE, W. H. BUCK (Mobil Research and Development Corp., Paulsboro, NJ), and F. FEINBERG (Mobil Oil Corp., U.S. Marketing and Refining Div., Fairfax, VA) IN: Aviation gas turbine lubricants - Military and civil aspects: Aviation fuel and lubricants - Performance testing; Proceedings of the Aerospace Technology Conference and Exposition, Long Beach, CA, October 14-17, 1985 . Warrendale, PA, Society of Automotive Engineers, Inc., 1985, p. 1-17.
(SAE PAPER 851797)

Laboratory oxidation tests used to evaluate jet engine oils for stability and deposit control in several physical configurations are described. The use of these tests to formulate a new oil with enhanced capabilities at high temperatures is reported along with field evaluations which show performance benefits consistent with laboratory test results. A particular improvement has occurred in the number of oil-related engine removals. Additional improvements reported include cleaner engines, resulting in increased reliability of carbon seals, reduced oil consumption, improved engine reliability, and reduced maintenance. The results show that the laboratory tests can accurately discriminate among oils in terms of performance capability. C.D.

**A86-38528**

### PERFORMANCE ADVANTAGES OF HIGH LOAD AVIATION LUBRICANTS

D. S. BOSNIACK (Exxon Research and Engineering Co., Products Research Div., Annandale, NJ) and S. J. METRO IN: Aviation gas turbine lubricants - Military and civil aspects: Aviation fuel and lubricants - Performance testing; Proceedings of the Aerospace Technology Conference and Exposition, Long Beach, CA, October 14-17, 1985 . Warrendale, PA, Society of Automotive Engineers, Inc., 1985, p. 19-32.
(SAE PAPER 851798)

Aviation lubricants were extensively tested at severe conditions to determine the performance advantages of incorporating a load carrying additive. A high load oil performed at least as well or better than a normal load oil in the bearing rig test at Type 1 through Type 2-1/2 conditions. At the extremely severe Type 2-3/4 conditions, in an inerted atmosphere, all oils tested containing load carrying additives successfully completed the 100-hour test, while all oils tested without the additive suffered catastrophic failure in less than 10 hours. The role of the load carring additive in the protection of loaded, moving parts, as in the Ryder Gear Machine, was examined. Data for the anti-scuffing protection afforded by this additive through surface adsorption on working gears is presented. Author

**A86-38530**

### A STUDY OF THE POTENTIAL BENEFITS ASSOCIATED WITH THE DEVELOPMENT OF A DEDICATED HELICOPTER TRANSMISSION LUBRICANT

R. J. DRAGO (Boeing Vertol Co., Philadelphia, PA), P. J. MANGIONE, and R. D. WENDRZYCKI (U.S. Navy, Naval Air Propulsion Test Center, Trenton, NJ) IN: Aviation gas turbine lubricants - Military and civil aspects: Aviation fuel and lubricants - Performance testing; Proceedings of the Aerospace Technology Conference and Exposition, Long Beach, CA, October 14-17, 1985 . Warrendale, PA, Society of Automotive Engineers, Inc., 1985, p. 59-68.
(SAE PAPER 851832)

A common oil is now used in both the engines and transmissions of virtually all U.S. military helicopters. While this provides significant logistic advantages, these advantages are attained only by compromising the optimization of the oil for either system. The results of two studies undertaken to determine what benefits would accrue to the development of a special oil tailored specifically to meet the unique requirements of high-speed, heavily loaded helicopter transmission systems are presented. These studies, conducted independently by two major helicopter manufacturers under the direction of the Naval Air Propulsion Center, addressed specific problem areas related to typical production aircraft in order to reach well-documented conclusions. In addition, the effect of the availability of such a special gear-box lubricant on the development of other advanced-technology components was evaluated and documented. Author

**A86-38533**

### FUTURE TRENDS FOR U.S. NAVAL AVIATION PROPULSION SYSTEM LUBRICANTS

J. T. SHIMSKI and L. A. PASKOW (U.S. Navy, Naval Air Propulsion Test Center, Trenton, NJ) IN: Aviation gas turbine lubricants - Military and civil aspects: Aviation fuel and lubricants - Performance testing; Proceedings of the Aerospace Technology Conference and Exposition, Long Beach, CA, October 14-17, 1985 . Warrendale, PA, Society of Automotive Engineers, Inc., 1985, p. 95-102.
(SAE PAPER 851835)

Although present performance of aircraft gas turbine engine lubricants is satisfactory, two major areas have been targeted for improvement: static bearing corrosion and thermal stability of the oil. Trends in future engine designs indicate that waste heat rejection will be the limiting factor in the development of high temperature lubricants. Field experience has shown that present performance of aircraft gas turbine engine lubricants in helicopter gearbox systems is marginal. A three-phase program has been initiated to develop a separate lubricant with improved load-carrying capacity and corrosion inhibition. Future design requirements will have to incorporate new materials and lubricants concurrently. Author

### DEVELOPMENT OF THE PORTABLE WATER SEPAROMETER FOR THE WSIM TEST

P. W. KIRKLIN (Mobil Research and Development Corp., Paulsboro, NJ), F. R. EDMONDSON (EMCEE Electronics, Inc., Sarasota, FL), F. P. MORSE (USAF, Directorate of Energy Management, Kelly AFB, TX), and W. G. DUKEK IN: Aviation gas turbine lubricants - Military and civil aspects: Aviation fuel and lubricants - Performance testing; Proceedings of the Aerospace Technology Conference and Exposition, Long Beach, CA, October 14-17, 1985 . Warrendale, PA, Society of Automotive Engineers, Inc., 1985, p. 133-141. refs
(SAE PAPER 851870)

The water separation index, modified (WSIM) test, ASTM D2550, is used to indicate the presence of harmful levels of surface active agents (surfactants) in jet fuel. Many fuel suppliers, handlers and users have replaced the complex laboratory test, ASTM D2550, with a quick, simple test, ASTM D3948, that uses a compact, portable field test instrument, the Micro-Separometer. Results of co-operative ASTM test programs to develop the Micro-Separometer test are presented. The report shows that the Micro-Separometer produces the same water separation index as ASTM D2550 and that the test precision is equivalent or better. Author

### LINEAR DYNAMIC COUPLING IN GEARED ROTOR SYSTEMS

J. W. DAVID (North Carolina State University, Raleigh) and L. D. MITCHELL (Virginia Polytechnic Institute and State University, Blacksburg) ASME, Transactions, Journal of Vibration, Acoustics, Stress, and Reliability in Design (ISSN 0739-3717), vol. 108, April 1986, p. 171-176. refs
(Contract NSG-3239)
(ASME PAPER 85-DET-11)

The effects of high frequency oscillations caused by the gear mesh, on components of a geared system that can be modeled as rigid discs are analyzed using linear dynamic coupling terms. The coupled, nonlinear equations of motion for a disc attached to a rotating shaft are presented. The results of a trial problem analysis show that the inclusion of the linear dynamic coupling terms can produce significant changes in the predicted response of geared rotor systems, and that the produced sideband responses are greater than the unbalanced response. The method is useful in designing gear drives for heavy-lift helicopters, industrial speed reducers, naval propulsion systems, and heavy off-road equipment. I.S.

### BUCKLING AND FINAL FAILURE OF GRAPHITE/PEEK STIFFENER SECTIONS

S. M. CAUSBIE (Boeing Commerical Airplane Co., Seattle, WA) and P. A. LAGACE (MIT, Cambridge, MA) IN: Structures, Structural Dynamics and Materials Conference, 27th, San Antonio, TX, May 19-21, 1986, Technical Papers. Part 1 . New York, American Institute of Aeronautics and Astronautics, 1986, p. 280-287. refs
(AIAA PAPER 86-0921)

The buckling and final failure characteristics of laminated angle and channel stiffener sections made of APC-2 graphite/thermoplastic material which employs PEEK fibers were investigated. Three stacking sequences with the same ply orientations were used in the experimental studies, the results of which were compared with buckling loads and modes estimated by use of the Ritz technique. Both the theoretical and experimental results indicate that buckling load decreases as (1) the side boundary conditions of the critical stiffener element become less restrictive; (2) the effective width/thickness ratio of the critical stiffener element is increased; (3) the bending stiffness term decreases; and (4) the bending-twisting coupling terms increase. The experimental results are similar to those obtained for similar sections made from T300/5208 graphite/epoxy material. I.S.

### OBSERVATIONS ON COMPRESSIVE LOCAL BUCKLING, POSTBUCKLING AND CRIPPLING OF GRAPHITE/EPOXY AIRFRAME STRUCTURE

L. W. REHFIELD and A. D REDDY (Georgia Institute of Technology, Atlanta) IN: Structures, Structural Dynamics and Materials Conference, 27th, San Antonio, TX, May 19-21, 1986, Technical Papers. Part 1 . New York, American Institute of Aeronautics and Astronautics, 1986, p. 301-306. Research supported by the United Technologies Corp. refs
(Contract DAAG29-82-K-0094)
(AIAA PAPER 86-0923)

Local buckling, postbuckling, and crippling of I-section composite specimens under axial compression were studied using high-speed photography. The specimens, representative of an airframe structure, were made of C3000/5225 graphite-epoxy woven cloth with five different web and flange ply layups. The results have shown that the critical failure mode is flange edge delamination followed by simultaneous failure of the flange and web. This finding implies that casual use of material strength criteria, without having a criterion for free edge delamination, may be misleading, and that multiple failure modes must be considered in order to reliably predict crippling. I.S.

### STRENGTH EVALUATION OF HELICOPTER COMPOSITE BOLTED JOINTS

S. P. GARBO, S. W. HONG, and W. KIM (United Technologies Corp., Sikorsky Aircraft Div., Stratford, CT) IN: Structures, Structural Dynamics and Materials Conference, 27th, San Antonio, TX, May 19-21, 1986, Technical Papers. Part 1 . New York, American Institute of Aeronautics and Astronautics, 1986, p. 486-494. refs
(AIAA PAPER 86-0973)

Preliminary results of an analytical and experimental evaluation of the strength of bolted joints of three different composite systems considered for helicopter applications are reported. The three systems, carbon/epoxy tape, carbon/epoxy fabric, and carbon/bismaleimide laminates, were tested to failure using open-hole and bolt-bearing configurations, and stress-strain analysis was carried out for various hole-size geometries and bearing-bypass load conditions. Initial theory/test correlations successfully verified predicted failure modes and location of failure. Open-hole failure load predictions were used to establish a candidate characteristic dimension which was used to predict preliminary bypass vs bearing strength envelopes for the three material systems. For the application geometries tested, no significant differences in solutions due to geometry effects were determined. V.L.

**BUCKLING BEHAVIOR OF RENE 41 TUBULAR PANELS FOR A HYPERSONIC AIRCRAFT WING**

W. L. KO, R. A. FIELDS (NASA, Flight Research Center, Edwards, CA), and J. L. SHIDELER (NASA, Langley Research Center, Hampton, VA) IN: Structures, Structural Dynamics and Materials Conference, 27th, San Antonio, TX, May 19-21, 1986, Technical Papers. Part 1 . New York, American Institute of Aeronautics and Astronautics, 1986, p. 517-544. refs

(AIAA PAPER 86-0978)

The buckling characteristics of Rene 41 tubular panels for a hypersonic aircraft wing were investigated. The panels were repeatedly tested for buckling characteristics using a hypersonic wing test structure and a universal tension/compression testing machine. The nondestructive buckling tests were carried out under different combined load conditions and in different temperature environments. The force/stiffness technique was used to determine the bucking loads of the panels. In spite of some data scattering resulting from large extrapolations of the data-fitting curve (because of the termination of applied loads at relatively low percentages of the buckling loads), the overall test data correlate fairly well with theoretically predicted buckling interaction curves. Also, the structural efficiency of the tubular panels was found to be slightly higher than that of beaded panels. Author

**APPLICATION OF LOW TEMPERATURE CURING PREPREGS AND VACUUM BAG MOLDING TECHNIQUES TO THE MANUFACTURING OF A COMPOSITE WING**

E. AHOPELTO (Helsinki University of Technology, Espoo, Finland) IN: Structures, Structural Dynamics and Materials Conference, 27th, San Antonio, TX, May 19-21, 1986, Technical Papers. Part 1 . New York, American Institute of Aeronautics and Astronautics, 1986, p. 695-699.

(AIAA PAPER 86-1019)

The design and development of a composite wing for the L-80 Turbo Trainer are described. The strength properties of the wing's graphite/epoxy materials are studied. The wing has a sandwich construction in order to provide sufficient stiffness with a minimum number of parts. Vacuum modeling techniques and low curing temperatures are utilized in the manufacturing of the upper and lower surface panels, main spar, leading edge, front and rear spars, and the wing ribs. The inspection of the reinforced plastic components is discussed. It is noted that the vacuum bag techniques are applicable for the manufacturing of all the large shallow parts of the composite wing; however, they are unsuitable for the development of complex structures such as wing ribs. I.F.

**AEROELASTIC TAILORING OF COMPOSITE WINGS WITH EXTERNAL STORES**

J. A. GREEN (Stanford University, CA) IN: Structures, Structural Dynamics and Materials Conference, 27th, San Antonio, TX, May 19-21, 1986, Technical Papers. Part 1 . New York, American Institute of Aeronautics and Astronautics, 1986, p. 710-719. refs

(Contract NGL-05-020-243)

(AIAA PAPER 86-1021)

The use of an integrating matrix solution procedure allows the aeroelastic stability of a large number of wing/store combinations to be studied with relative speed and accuracy. Results are presented which show the effects of tailoring the orientation of the plies of laminated composite wings when external stores are present. The stores utilized take the form of concentrated masses that are varied in terms of size and location, and combinations of stores are also studied. It is seen that there are cases for which small changes in the laminate can produce large changes in the aeroelastic stability boundary, and for such situations care should be used in tailoring a wing. For a given wing, the choice fiber angle to optimize the aeroelastic performance is quite sensitive to both the size and location of the store. Author

**STOCHASTIC FLUTTER OF NONLINEAR AEROELASTIC STRUCTURES WITH PARAMETER RANDOM FLUCTUATIONS**

R. A. IBRAHIM (Texas Tech University, Lubbock) and H. HEO IN: Structures, Structural Dynamics and Materials Conference, 27th, San Antonio, TX, May 19-21, 1986, Technical Papers. Part 2 . New York, American Institute of Aeronautics and Astronautics, 1986, p. 533-543. refs

(Contract AF-AFOSR-85-0008)

(AIAA PAPER 86-0962)

The random response of nonlinear aeroelastic structural systems with time-dependent parameters is analyzed using recent developments in the mathematical theory of stochastic differential equations. In particular, the Ito stochastic calculus and the Fokker-Planck equation approach are used to derive a general differential equation which describes the evolution of the response moments. This equation constitutes an infinite coupled set of moment equations which are truncated by using two closure schemes. It is found that the random model interaction is governed mainly by the internal resonance ratio and the stiffness fluctuation intensity. The random variation of the system stiffness is shown to have a considerably greater effect on the system response than the random damping fluctuation. V.L.

**EFFECTS OF NONLINEAR DAMPING ON RANDOM RESPONSE OF BEAMS TO ACOUSTIC LOADING**

C. MEI (Old Dominion University, Norfolk, VA) and C. B. PRASAD IN: Structures, Structural Dynamics and Materials Conference, 27th, San Antonio, TX, May 19-21, 1986, Technical Papers. Part 2 . New York, American Institute of Aeronautics and Astronautics, 1986, p. 644-653. refs

(Contract NAS1-17993)

(AIAA PAPER 86-1004)

Effects of both nonlinear damping and large-deflection are included in the theoretical analysis in an attempt to explain the experimental phenomena of aircraft panels excited at high sound pressure levels; that is the broadening of the strain response peak and the increase of the modal frequency. Two nonlinear damping models are considered in the analysis using a single-mode approach. Mean square maximum deflection, mean square maximum strain, and spectral density function of maximum strain for simply supported and clamped beams are obtained. It is demonstrated that nonlinear damping contributes significantly to the broadening of the response peak and to the mean square maximum deflection and strain. Author

**DEVELOPMENTS IN BOUNDARY ELEMENT METHODS - 4**

P. K. BANERJEE, ED. (New York, State University, Buffalo) and J. O. WATSON, ED. (Imperial College of Science and Technology, London, England) London and New York, Elsevier Applied Science Publishers, 1986, 356 p. For individual items see A86-38967 to A86-38971.

Recent developments in boundary element methods are discussed. New Hermitian cubic boundary elements are described which lead to better representations of boundary geometry and functions, particularly for fracture mechanics. A new advanced transient dynamic analysis for three-dimensional problems is presented, and stress analysis of axisymmetric bodies under nonaxisymmetric loading is discussed. A new plate bending formulation is presented in which a new class of fundamental solutions is developed which eliminates some of the problems related to strong singularities in a standard plate bending formulation. A novel application of the method to the nonlinear deformation analysis of sandwich plates and shallow shells is discussed. The first application of boundary element methods to problems of transient nonlinear heat transfer is described. A series of applications to some nonlinear geomechanics problems is presented in which the linear part of the region is modelled by boundary elements and the nonlinear region by finite elements. Recent developments in modelling fluid flow problems in the aircraft industry are surveyed. C.D.

### PROCESSES FOR THE MANUFACTURE OF AVIATION INSTRUMENT COMPONENTS (2ND REVISED AND ENLARGED EDITION) [TEKHNOLOGIIA IZGOTOVLENIIA DETALEI AVIATSIONNYKH PRIBOROV /2ND REVISED AND ENLARGED EDITION/]

A. N. GAVRILOV Moscow, Izdatel'stvo Mashinostroenie, 1985, 232 p. In Russian. refs

The principles governing the design of processes for the manufacture of aviation instrument components are reviewed, as are the technical and economic characteristics of specific manufacturing processes. In particular, attention is given to the characteristic features of the production of aviation instruments, methods for the design of standardized manufacturing processes, production automation, and methods for the calculation and analysis of machining errors and tolerances. Other topics discussed include ways of increasing the reliability of aviation instruments at the stage of production, selection of an optimal process for the manufacture of specific components, and characteristics of processes for the manufacture of various types of components, including bushings, threaded parts, gears, permanent magnets, gyroscope components, and printed circuits. ### USE OF A CO2 LASER LIDAR FOR FLIGHT AND PENETRATION AT VERY LOW ALTITUDES [UTILISATION D'UN LIDAR A LASER CO2 POUR LE VOL ET LA PENETRATION A TRES BASSE ALTITUDE]

B. STEPHAN *In* AGARD Guidance-Control-Navigation Automation for Night All-Weather Tactical Operations 8 p Oct. 1985
Avail: NTIS HC A07/MF A01

A CO2 laser optical sensor system which allows the acquisition of accurate land distances for a large area is described. These values are obtained in a real-time mode with the use of a UMP 7800 computer, and allow the generation of a map of the terrain to determine geographic coordinates. This map makes it possible to determine the optimal navigation trajectory at very low altitudes, with optimization based on the terrain features. This sensor was tested at Villacoublay in 1984 and is currently under testing at C.E.V. The results of the experiments and the static and dynamic analysis tests are presented. Transl. by T.R.

### COMPARATIVE STUDY OF NONDESTRUCTIVE PAVEMENT TESTING, WES (WATERWAYS EXPERIMENT STATION) NDT (NONDESTRUCTIVE TESTS) METHODOLOGIES Final Report

J. W. HALL and D. R. ALELXANDER Sep. 1985 66 p
(AD-A163379; WES-MP-GL-85-26) Avail: NTIS HC A04/MF A01 CSCL 13B

A demonstration of nondestructive airfield pavement evaluation procedures conducted by the US Army Engineer Waterways Experiment Station (WES) using both the WES 16-kip vibrator and a Dynatest falling weight deflectometer (FWD) is described. The nondestructive tests (NDT) were conducted at MacDill Air Force Base on five pavement test areas consisting of asphaltic concrete, portland cement concrete, and composite pavements. Two methods of data analysis were used. The dynamic stiffness modulus (DMS) method used dynamic deflection data from the WES 16-kip vibrator with a correlation analysis developed a number of years ago by WES. This method uses a correlation between the DSM (a load-deflection ratio) and the allowable load on a single wheel as derived from traditional test pit methods. The second analysis scheme used measured deflection basins at the pavement surface and layered elastic theory. Elastic moduli are computed by matching measured deflection basins with computed basins. Limiting stress/strain is then used to compute allowable aircraft loadings. This method was used with data from both the WES 16-kip vibrator and the FWD. Also demonstrated was a method of determining joint load transfer and of making appropriate adjustments to the allowable load to account for lack of load transfer. GRA

### A COMPARISON OF VOICE AND KEYBOARD DATA ENTRY FOR A HELICOPTER NAVIGATION TASK Final Report

F. J. MALKIN and K. A. CHRIST Dec. 1985 42 p
(AD-A163245; HEL-TM-17-85) Avail: NTIS HC A03/MF A01 CSCL 17B

The Doppler navigation set, AN/ASN 128 was used to compare manual keyboard data entry of navigation map coordinates with an isolated-word speech recognition system. Twelve male Army aviators entered data by keyboard and by voice while controlling a helicopter flight simulator. The results indicated that although the keyboard mode was faster than the voice mode of data entry, the aviators preferred using voice. Voice data entry was perceived as requiring less effort and reducing pilot workload. However, the relative slowness and low accuracy (85.5 percent) of voice data entry highlight the limitations that may exist for speech recognition systems in performing time or task critical functions. ### THERMODYNAMIC EVALUATION OF TRANSONIC COMPRESSOR ROTORS USING THE FINITE VOLUME APPROACH Semiannual Status Report, 20 Dec. 1985 - 31 May 1986

S. NICHOLSON and J. MOORE 1986 81 p
(Contract NAG3-593)
(NASA-CR-176840; NAS 1.26:176840; JM/86-2) Avail: NTIS HC A05/MF A01 CSCL 20D

The finite volume explicit time marching method was refined and improved. Previously, extension had been made to the finite volume method to improve the accuracy of the calculation of total pressure in inviscid flow, extend the method to allow the calculation of laminar and turbulent boundary layers in internal flows, and improve the shock capturing properties of the method by introducing a Mach number dependent interpolation scheme for the pressure used in the calculating the density. The current work extends these developments by using the new pressure interpolation scheme in two dimensional viscous calculations, including a more complete description of the viscous stresses, introducing a criteria for the transverse upwind differencing which is a function of the ratio of transverse and streamwise mass fluxes, and allowing the calculation of internal flow where boundary layers are present on both walls of the duct. The manner in which the viscous stresses are evaluated in the nonorthogonal, nonuniform grid is detailed. The convergence is investigated and results for calculations of laminar flow in a converging duct are presented. Results for calculations of transonic flow in a converging-diverging nozzle are presented and the results are compared with Sajben's measurements and calculations by others. Author

**AN EVALUATION OF THE CAPABILITY OF THE SURFACE CONDITION ANALYZER (SCAN) SENSORS TO MEASURE RUNWAY WATER DEPTH Final Report, Mar. 1981 - Jan. 1986**
C. W. ROGERS, E. J. MACK, and B. J. WATTLE Jan. 1986 58 p
(Contract N00014-81-C-0443)
(AD-A164719; CALSPAN-6857-M-1) Avail: NTIS HC A04/MF A01 CSCL 14B

Field tests of Surface Systems, Inc.'s Surface Condition Analyzer's (SCAN) capability to measure runway water depth during rainfall events were performed at the Spirit of St. Louis Airfield, St. Louis, Mo., during March-May of 1985. These limited tests were scheduled to provide data in real rainfall events and to answer questions of sensor capability relative to true runway water depth and or sensor installation and siting protocol--i.e., should the sensor surface be horizontal or flush relative to a sloping runway surface. Field calibration checks showed that sensors installed in the runway surface can measure in-situ water depth in the range 0.030 to 0.40 inches (+ or = 0.01 inches). In real rainfall with rates ranging from 0.30 inches/hour (very light) to 6.0 inches/hour (heavy), it was found that the sensor-measured water depth correlated very well with an independently measured water depth over the range 0.03 to 0.10 inches (maximum observed). At the lower end of this range, both sensors measured the same water depth, while at the top end, the sloping, flush-mounted sensor indicated only about 75% of the water depth measured independently and by the horizontally mounted sensor. The results of a thermodynamic cycle (SFC) and weight analysis performed to establish engine configuration, size, weight and performance are reported. Baseline design configuration was a 2,000 hour MTBO Compound Cycle Engine (CCE) for a helicopter application. The CCE configuration was extrapolated out to a 10,000 MTBO for a shipboard genset application. The study showed that an advanced diesel engine design (CCE) could be substantially lighter and smaller (79% and 82% respectively) than todays contemporary genset diesel engine. Although the CCE was not optimized, it had about a 7% reduction in mission fuel consumption over today's genset diesels. The CCE is a turbocharged, power-compounded, high power density, low-compression ratio diesel engine. Major technology development areas are presented. Author

**THE POSTBUCKLING BEHAVIOR OF BLADE-STIFFENED CARBON EPOXY PANELS LOADED IN COMPRESSION**
J. F. M. WIGGENRAAD 19 Feb. 1985 20 p
(Contract NIVR-312.2-1019)
(NLR-MP-85019-U; B8577052; ESA-86-96977-L) Avail: NTIS HC A02/MF A01

The postbuckling behavior of blade-stiffened carbon epoxy panel laminates consisting of only a few layers due to the relatively low design loads was studied in compression tests. Certain coupling terms in the stiffness matrices were thought to be no longer insignificant. The full scale panels buckle in a global mode and do not show any postbuckling strength. The short columns, buckling in a local mode, support 1.8 times the initial buckling load before failure. Comparison with calculations shows that the influence of the coupling terms on the buckling behavior of the specimens is relatively small: it decreases the buckling load slightly, does not change the end shortening curves significantly and is mainly apparent in the out-of-plane deflections. ESA

**N86-26662#** National Aerospace Lab., Amsterdam (Netherlands). Structures and Materials Div.
**SOME TESTS TO ASSESS THE EFFECT OF CRACK STOPPERS ON THE FATIGUE LIFE OF CENTER-NOTCHED SPECIMENS**
J. SCHIJVE and F. A. JACOBS Feb. 1984 33 p refs
(NLR-TR-84051-U; B8576224; ESA-86-96981) Avail: NTIS HC A03/MF A01

Crack stoppers were evaluated in crack propagation tests on Alclad 2024-T3 sheet specimens (thickness 2 mm) provided with a central crack to assess the usefulness of very simple crack stopping elements which can be applied to macrocracks in sheet metal structures accessible from one side only. Results show that a stop hole at the crack tip should be filled to obtain a good propping of the hole. Self tapping screws and tapered pins give large crack growth retardation lives. Large retardations are obtained with hard driven rivets and with heavily tightened bolts in the stop holes, but they require accessibility from two sides. Flight-simulation loading on specimens with tightened bolts indicates a significant retardation, but quantitatively the effects under flight-simulation loading and under constant-amplitude loading are highly different. ESA

**CONSTANT AMPLITUDE AND FLIGHT SIMULATION OF FATIGUE TESTS ON ADHESIVE BONDED LAP JOINT SPECIMENS OF 2024-T3 SHEET MATERIAL**

J. SCHIJVE and F. A. JACOBS 9 Aug. 1984 47 p refs
(Contract NIVR-1725)
(NLR-TR-84090-U; B8576223; ESA-86-96982) Avail: NTIS HC A03/MF A01

Fatigue tests were carried out on Redux and FM 123/5 bonded specimens at various stress levels, temperatures (RT to 65C) and low and high test frequencies. Type of failure (bond line failure or sheet failure) and the significance of the adhesive squeeze-out for crack nucleation were examined. Results indicate that the fatigue notch effect of a thickness increase as a result of adhesive bonding of sheet material is very small; the effect of secondary bending is more significant. If the bending effect is not excessive (depending on the design) the fatigue strength of a bonded lap joint is high. In flight-simulation tests, bond line failures do not occur even under severe test conditions. The life in flight is highly superior to results for riveted lap joint and a single shear strap joint, while it is of the same order of magnitude found for riveted double-strap joints. ESA

**A VORTEX POINT METHOD FOR CALCULATING INVISCID INCOMPRESSIBLE FLOWS AROUND ROTARY WINGS**

B. CANATLOUBE and S. HUBERSON *In its* La Recherche Aerospatiale. Bimonthly Bulletin, no. 1984-6, November - December 1984 (ESA-TT-907) 13 p May 1985 Previously announced in IAA as A86-12021
Avail: NTIS HC A04/MF A01; HC also available in English and French from ONERA, Paris FF 70

An integral method is presented for calculating incompressible inviscid unsteady flow around thin bodies in arbitrary motion, i.e., rotor blades in motion with respect to one another. Because an integral method is used, discretization is limited to the solid boundaries and the vortices. Boundary conditions are treated in terms of equation for the slipstream on the walls, the vorticity vector, a volume integral for the vorticity and a first-order Fredholm integral. The Helmholtz equation governs the evolution of vorticity, which forms a sheet of doublets. The pressure jumps on the blades are covered by the unsteady Bernoulli equation. Applications of the method to helicopter rotors, medium- and high-aspect ratio propellers and low-aspect ratio nautical propellers are demonstrated. M.S.K. (IAA)

**OXYGEN CHEMISORPTION CRYOGENIC REFRIGERATOR Patent Application**

J. A. JONES, inventor (to NASA) (Jet Propulsion Lab., California Inst. of Tech., Pasadena) 24 Apr. 1986 15 p Sponsored by NASA
(NASA-CASE-NPO-16734-1-CU; NAS 1.71:NPO-16734-1-CU; US-PATENT-APPL-SN-855982) Avail: NTIS HC A02/MF A01 CSCL 13I

The present invention relates to a chemisorption compressor cryogenic refrigerator which employs oxygen to provide cooling at 60 K to 100 K. The invention includes dual vessels containing an oxygen absorbent material, alternately heated and cooled to provide a continuous flow of high pressure oxygen, multiple heat exchangers for precooling the oxygen, a Joule-Thomson expansion valve system for expanding the oxygen to partially liquefy it and a liquid oxygen collection vessel. The primary novelty of the present invention lies in the provision of a refrigeration system which makes use of reversible chemical reactions with oxygen to provide cooling at 60 K to 100 K. NASA

Avail: NTIS HC A17/MF A01

A digital telemetry system for measuring pressures in interblade passages on large fan engines and model fan rigs was developed. The telemetry system replaces the slip-rings used in previous tests, and incorporates on rotor digitization and hybrid circuit techniques. Simultaneous cpacity is 48 measurements, in the dc to 3 kHz bandwidth. Measurement accuracy is + or - 0.5% fsd (dc) to 1.0% fsd (ac). Dynamic range is 60 dB. Input sensitivity is 0 to 80 mV for 0 to 25 psia. Applications are to an RB 211 development engine and a model scale fan rig. Engine shaft speed is 3900 rpm, rig speed is 10,000 to 11,000 rpm. **STATIC AEROELASTICITY IN COMBAT AIRCRAFT**
Jan. 1986 42 p
(AGARD-R-725; ISBN-92-835-1516-1) Avail: NTIS HC A03/MF A01

A review of fighter aircraft development programs over the past three decades indicates a trend of increasing emphasis on the consideration of static aeroelastic effects. While early concerns addressed only the impact on air vehicle structural integrity, current design philosophy recognizes and addresses aeroelasticity as a primary design parameter affecting structural optimization, vehicle aerodynamic stability, control effectiveness, and overall performance. Examples from wind tunnel testing, analytical studies, and operational applications are presented to justify this emphasis, illustrate current methodology and analysis techniques, and make a case for an integrated approach to the consideration of static aeroelastic effects at all stages of the design process. **INTERNATIONAL CONFERENCE ON THE AVIATION WEATHER SYSTEM, 2ND, UNIVERSITE DU QUEBEC, MONTREAL, CANADA, JUNE 19-21, 1985, PREPRINTS**
Conference sponsored by the American Meteorological Society, Canadian Meteorological and Oceanographic Society, ICAO, and WMO. Boston, MA, American Meteorological Society, 1985, 388 p. For individual items see A86-37452 to A86-37512.

The present conference considers weather forecasters' liability for inaccurate forecasts, the ICAO's World Area Forecast System, the FAA's future aviation weather system and its current Automated Weather Observing System, aircraft icing observation and analysis, the unified message switch and its application to aviation weather support, the hazards of ash clouds to civil air transport, NASA storm hazards research in lightning strikes to aircraft, and terrain-induced wind shear as the possible cause of the Jetstar N520S accident. Also discussed are the uncertainty of visibility measurements in radiation fog, challenges for clear air turbulence research, modernization of weather support for NASA's STS, the 'nowcasting' of rain, freezing rain and thunderstorms, the numerical simulation of precipitation-induced downbursts, and the role of thermodynamic effects in severe downdrafts. Attention is finally given to the USAF Automated Weather Distribution System, technological improvements to Naval Aviation weather support, a meteorological interactive data display system, and weather research and logistics at Cape Canaveral. O.C.

**A86-37454**
**THE SAFETY AND ECONOMIC IMPACT OF IMPROVED AVIATION WEATHER SERVICES**
J. W. HINKELMAN, JR. (NOAA, PROFS Program Office, Boulder, CO) IN: International Conference on the Aviation Weather System, 2nd, Montreal, Canada, June 19-21, 1985, Preprints . Boston, MA, American Meteorological Society, 1985, p. 29-40. refs

Flight safety and operational efficiency in both en route and terminal airspace are expected to be substantially enhanced by the novel Aviation Weather System. These improvements will be due to improved radar detection, identification and tracking, more automated surface observations, the automation of upper air observations by means of a national profiler system, and the automated collection/processing/distribution of pilot reports. Automation will also allow the tailoring of weather data for direct operational application, and could provide real-time hazardous weather avoidance assistance to pilots. O.C.

**A86-37456**
**NMC PLANS FOR IMPROVED AVIATION GUIDANCE**
J. A. BROWN, JR., R. D. MCPHERSON, and J. P. GERRITY, JR. (NOAA, Development Div., Washington, DC) IN: International Conference on the Aviation Weather System, 2nd, Montreal, Canada, June 19-21, 1985, Preprints . Boston, MA, American Meteorological Society, 1985, p. 44-47.

The numerical weather forecasting efforts of the U.S. National Meteorological Center are focused on the use of the Class VI CYBER 205 computer. A totally revised Regional Analysis and Forecast System was introduced into the operational production schedule in 1985; more recently, the global forecasting system was revised to separate the Medium Range Forecast guidance for 3-10 day intervals from the twice-daily global forecasts (which primarily address international aviation requirements). In both cases, significant forecast improvements have been achieved. O.C.

**A86-37458**
**THE FEDERAL AVIATION ADMINISTRATION FUTURE AVIATION WEATHER SYSTEM**
E. MANDEL (FAA, Washington, DC), M. MANN (Martin Marietta Corp., Washington, DC), and J. KEFALIOTIS (Stanford Telecommunications, Inc., Washington, DC) IN: International Conference on the Aviation Weather System, 2nd, Montreal, Canada, June 19-21, 1985, Preprints . Boston, MA, American Meteorological Society, 1985, p. 55-62.

The National Airspace System's weather system upgrading effort attempts to ensure the availability of adequate weather data to pilots, in the interest of hazard avoidance and effective traffic flow planning. Dramatic improvements have been made by this program in such areas as weather sensors, data processing, and weather display/distribution systems. Attention is given to the Next Generation Weather Radar, the Automated Weather Observing System, the Low Level Windshear Alert System, Runway Visual Range systems, and the Airport Surveillance Radar Weather channel 'ASR-9'. O.C.

**A86-37459**
**THE FAA AUTOMATED WEATHER OBSERVING SYSTEM (AWOS)**
R. H. CHRISTIANSEN and F. E. GILK (Kentron International, Inc., Arlington, VA) IN: International Conference on the Aviation Weather System, 2nd, Montreal, Canada, June 19-21, 1985, Preprints . Boston, MA, American Meteorological Society, 1985, p. 63-68.

The FAA's Automated Weather Observing System (AWOS) will furnish weather parameters to pilots, during takeoff and landing phases of flight, and ATC personnel, for the management of a given ATC zone. At a minimum, AWOS will detect and report wind speed and direction, temperature, dew point, pressure, cloud cover and height, and precipitation. Computer generated voices over telephones and ground-air radios will both be used for AWOS data distribution, and its digitized weather observation data will be transmitted over various data links to the National Weather Network. O.C.

**A86-37460**

**AUTOMATION OF SURFACE OBSERVATIONS PROGRAM**

S. E. SHORT (NOAA, National Weather Service, Silver Spring, MD) IN: International Conference on the Aviation Weather System, 2nd, Montreal, Canada, June 19-21, 1985, Preprints . Boston, MA, American Meteorological Society, 1985, p. 69-75.

A prospective performance assessment is presented for the nationwide implementation of Automated Surface Observing Systems (ASOS). Two ASOS capability levels are planned: a basic level system for the automatic observation of aviation operations-supporting weather parameters, and a more completely automated stand-alone system for observing and reporting the full range of weather parameters. About 250 ASOS units are scheduled for operation by the end of the 1980s, at nearly all current National Weather Service primary observation sites; the majority of these will initially be basic systems, but most will ultimately be enhanced to full automation as the necessary sensors become available. O.C.

**A86-37461**

**THE FAA/M.I.T. LINCOLN LABORATORY DOPPLER WEATHER RADAR PROGRAM**

J. E. EVANS (MIT, Lexington, MA) and D. H. TURNBULL (FAA, Washington, DC) IN: International Conference on the Aviation Weather System, 2nd, Montreal, Canada, June 19-21, 1985, Preprints . Boston, MA, American Meteorological Society, 1985, p. 76-79. FAA-sponsored research.

Attention is given to the development status of a Next Generation Weather Radar-like transportable weather radar support facility which is being used to validate and refine scanning strategies, data processing methods, and weather detection algorithms applicable to the FAA's Terminal Doppler Weather Radar. Among the operational issues to be resolved by these research efforts are siting, optimum scanning strategy, optimum update rate, and interfacing with ATC facilities. Emphasis will be given to the development of a microburst-detection algorithm. O.C.

**A86-37462**

**THE CENTER AND CENTRAL FLOW WEATHER SERVICE UNIT PROGRAM**

J. UECKER and M. TOMLINSON (NOAA, National Weather Service, Silver Spring, MD) IN: International Conference on the Aviation Weather System, 2nd, Montreal, Canada, June 19-21, 1985, Preprints . Boston, MA, American Meteorological Society, 1985, p. 80-83.

Begun at 13 Air Route Traffic Control Centers in April, 1978, the Center and Central Flow Weather Service Unit programs have expanded to 21 sites in the coterminous US and in Alaska. Attention is given to the current status of these FAA-National Weather Service collaborative programs, with a view to the efficiency with which observations, forecasts and warnings of potentially hazardous weather conditions can be delivered to pilots. Briefing, meteorological impact statement, and Center Weather Advisory products are illustrated. O.C.

**A86-37466**

**A COLD-SEASON NORTH AMERICAN CLIMATOLOGY OF STRONG VERTICAL WIND SHEAR**

M. CAI and J. R. GYAKUM (Illinois, University, Urbana) IN: International Conference on the Aviation Weather System, 2nd, Montreal, Canada, June 19-21, 1985, Preprints . Boston, MA, American Meteorological Society, 1985, p. 98, 99.
(Contract NSF ATM-83-05096; NSF ATM-83-11175)

The strong vertical wind shear (SWS) zones above the surface boundary layer were investigated during the North American cold season by utilizing the excellent vertical resolution of the significant level wind data of a rawinsonde. Six-month twice-daily mandatory-level sounding data, including geopotential height, temperature and wind information, and significant wind and temperature data, of October 1, 1983 to March 31, 1984 were examined from latitude 25-70 N and longitude 50-130 W. SWS is defined as being geostrophically equivalent to a horizontal temperature contrast of 15.5 C/500 km (Sanders, 1967). It is found that during the cold season the tropospheric SWS zones occur preferentially in middle latitudes and in the western and eastern coastal North American regions, and a distinct minimum of events is observed in the central section of the continent at all levels. R.R.

**A86-37484**

**WINDSHEAR DETECTION USING A DOPPLER ACOUSTIC SOUNDER (SODAR)**

J. M. FAGE and P. HUGUET (Remtech, S. A., Velizy-Villacoublay, France) IN: International Conference on the Aviation Weather System, 2nd, Montreal, Canada, June 19-21, 1985, Preprints . Boston, MA, American Meteorological Society, 1985, p. 192-195. refs

Use of Doppler sodar for obtaining windshear and meteorological data is discussed. The sodar mesaures wind speed and wind direction, vertical wind speed, turbulence, and thermal stratification at altitudes up to 2000 ft, with about 100 ft resolution and 1-min time step. The sodar was shown to operate efficiently at adverse conditions of heavy rain, strong wind, or high background noise, and for all meteorological situations a high degree of correlation was obtained between the sodar and the airborne wind data. By combining a vertically pointed sodar with a network of anemometers of the Low Level Windshear Alarm System (LLWAS), a three-dimensional description of the windflow around airports is achieved, detecting the windshear associated with low level jets or with temperature inversion layers. The sodar is also successfully applied in the field of air pollution control. I.S.

**A86-37485**

**EVALUATION OF THE ASR-9 WEATHER REFLECTIVITY PRODUCT**

M. E. WEBER (MIT, Lexington, MA) and J. R. ANDERSON (Illinois, University, Urbana) IN: International Conference on the Aviation Weather System, 2nd, Montreal, Canada, June 19-21, 1985, Preprints . Boston, MA, American Meteorological Society, 1985, p. 196-202. FAA-sponsored research.

The airport surveillance radar (ASR)-9 and its weather processor are described, and the utility of its weather reflectivity product in an air traffic control environment is evaluated. The radar transmits either linearly or circularly polarized signals, selected on the basis of air traffic control requirements. A simulation procedure that utilizes a pencil-beam Doppler weather radar data and ground clutter measurements is described. Examples of the simulated weather reports are presented to illustrate: (1) partial beamfilling due to the fan-shaped surveillance antenna pattern; (2) attenuation of low velocity weather by the clutter filters; and (3) the effects of the spatial filters used in weather processing. I.S.

**A86-37487**

**WIDE AREA REAL-TIME THUNDERSTORM MAPPING USING LPATS - THE LIGHTNING POSITION AND TRACKING SYSTEM**

W. A. LYONS, K. G. BAUER (R Scan Corp., Minneapolis, MN), R. B. BENT, and W. H. HIGHLANDS (Atlantic Scientific Corp., Melbourne, FL) IN: International Conference on the Aviation Weather System, 2nd, Montreal, Canada, June 19-21, 1985, Preprints . Boston, MA, American Meteorological Society, 1985, p. 207-214.

The principles of operation of a time-of-arrival Lightning Position and Tracking System (LPATS) network are described, together with the techniques employed to display and interact with the data base of LPATS networks currently in operation. LPATS provides an instantaneous, sub-synoptic view of thunderstorms on a single display, whereas some ten radars would be needed to be composited to provide the same thunderstorm tracking capability. Aside from providing nowcasting support to aviation forecasters, pilot briefers, and controllers, the use of the LPATS data has greatly reduced the number of false alarms associated with other means of thunderstorms detection. Representative case studies are presented. I.S.

### EVALUATING THE NEW AUTOMATED WEATHER OBSERVING SYSTEM

V. L. NADOLSKI and J. T. BRADLEY (NOAA, Test and Evaluation Div., Sterling, VA) IN: International Conference on the Aviation Weather System, 2nd, Montreal, Canada, June 19-21, 1985, Proprints . Boston, MA, American Meteorological Society, 1985, p. 226-232. refs

A testing method for evaluating automated weather observing systems (AWOSs) is described and applied to the Lynchburg AWOS-3 evaluation. The evaluation scheme consists of: (1) an extensive software testing to ensure the correct programming of the AWOS-3 algorithms, (2) the engineering and environmental chamber testing of the total system, and (3) field tests conducted to determine responsiveness of the system and its limitations (particularly of the sensors), and adequacy of the algorithms. The test method is applicable to other types of AWOS and will be shortly used to evaluate a sophisticated NWS Automated Surface Observing System (ASOS). I.S.

### NUMERICAL SIMULATION OF PRECIPITATION INDUCED DOWNBURSTS

F. H. PROCTOR (SASC Technologies, Inc., Hampton, VA) IN: International Conference on the Aviation Weather System, 2nd, Montreal, Canada, June 19-21, 1985, Preprints . Boston, MA, American Meteorological Society, 1985, p. 257-264. refs
(Contract NAS1-17409)

Using the Terminal Area Simulation System (TASS), numerical simulations of downburst structure and sensitivity, based on vertical profiles of environmental temperature, humidity and wind velocity observed during the June and August 1982 JAWS project, are presented. Two-dimensional axisymmetric simulations examining downburst evolution, structure and sensitivity, assume a 40-m constant grid size on a 10-km diameter 5-km deep cylindrical domain. The three-dimensional experiment, examining the effects of vertical wind shear and other asymmetrical aspects of the downpour, assumed a 500-m constant horizontal grid size and a 35 x 35 x 18.5-km area. In the downburst primary structure depicted, outflow speeds were found to be sensitive to environmental temperature and humidity, as well as to precipitation radius and intensity. A vortex ring was found to propagate downwards, and maximum outflow winds occur when the vortex ring first reaches the surface. R.R.

**A86-37497**

### CATEGORIZATION OF ATMOSPHERIC TURBULENCE IN TERMS OF AIRCRAFT RESPONSE FOR USE IN TURBULENCE REPORTS AND FORECASTS

E. W. TURNER (USAF, Flight Dynamics Laboratory, Wright-Patterson AFB, OH) IN: International Conference on the Aviation Weather System, 2nd, Montreal, Canada, June 19-21, 1985, Preprints . Boston, MA, American Meteorological Society, 1985, p. 265-268.

The USAF, in an attempt to further categorize atmospheric turbulence, has proposed a method whereby individual aircraft gust sensitivity would be taken into account. The selected approach is to utilize the gust loads formula which relates the peak accelerations to be expected on one airplane to the peak accelerations measured on another airplane for flight through the same rough air. Topics discussed in detail include: (1) the relationship between gust amplitude and aircraft size, (2) the lift curve slope, and (3) the gust alleviation factor. It is concluded that the proposed method for calculating gust sensitivity should provide sufficient accuracy for turbulence forecasting. However, the amount of time spent in turbulence and its effect on pilot fatigue must also be taken into account. K.K.
